LANCASTER, a municipal borough and seaport town, the capital of Lancashire, England, is situated on the left bank of the river Lune, about 7 miles from its mouth, and on the London and North-Western Railway, 52 miles north-west of Manchester. It is built on the slope of an eminence crowned by the old castle and church, and commanding fine views of the river and surrounding country. The older portion of the town is irregularly built, but of late years it has been much improved by the formation of new streets; and the sanitary and other arrangements are complete and satisfactory. The Lune is crossed by a bridge of five arches erected in 1786, and to the north of the town the Lancaster Canal is conveyed over the river by a handsome aqueduct. The ancient castle occupies the site of a Roman *castrum*. The Saxon foundations of a yet older structure still remain, and the tower at the south-west corner is supposed to have been erected during the reign of the emperor Hadrian. The Dungeon Tower, also supposed to be of Roman origin, was taken down in 1818. The greater part of the old portion of the present structure was built by Roger de Poitou, who, however, utilized some of the old Roman towers and the old walls in its erection. In 1322 much damage was done to the castle by Robert Bruce, whose attack it successfully resisted, but it was restored and strengthened by John of Gaunt, who added the greater part of the Gateway Tower as well as turrets to the Lunges Tower, which on that account has been named "John of Gaunt's Chair." During the wars of the Commonwealth the castle was captured by Cromwell. Shortly afterwards it was converted into the county jail,

and the building now includes the governor's house and the crown and justus courts. To the north-east of the castle is the church of St Mary, in the Early English style, originally erected by Roger de Poitou, but partly rebuilt in 1759, when the present lofty tower was added. The church contains several old monuments and brasses. A large Gothic Roman Catholic church, with a convent and schools adjoining, was erected in 1858, and there are also several other churches and chapels of some architectural pretensions. There is a grammar school, completed in 1865. Among the charitable institutions are the county lunatic asylum, the Ripley orphan hospital, opened in 1864, erected and endowed at a cost of £100,000, the dispensary and infirmary instituted in 1781, and the Royal Albert asylum for idiots and imbeciles. The town possesses a large market and a handsome town-hall. The principal industries of the town are cotton and silk spinning, cabinetmaking, and the manufacture of oil-cloth table-covers, and there are also iron-foundries, marble-polishing works, and a manufactory for milney carriages and waggons. The bulk of the shipping is engaged in the coasting trade, and large vessels require to unload at Glasson, 5 miles down the river, the cargoes being carried up to the town by lighters. The population of the municipal borough in 1871 was 17,245, and in 1881 it was 20,724.

From discoveries of cells, flint arrow-heads, and other similar remains, it is probable that Lancaster was an old British town. Its Roman name is unknown, but inscribed Roman altars, tombstones, Samian ware, and other pottery, and the remains of the old fortress preceding the castle, and of other buildings, leave no doubt that it was a Roman station of great importance. It was constituted a borough in the fourth year of Richard I., and it first returned members to parliament in the twenty-third year of Edward I. The privilege was withdrawn for some years before 1547, but from that time was enjoyed without interruption until 1867, when it was disfranchised for corrupt practices. The town was plundered and burned by the Scots in 1299 and 1289, was nearly depopulated during the Wars of the Roses, was captured by the Parliamentary forces in 1646, and retaken by the Royalists under the earl of Derby in the same year, was held by the Parliamentary troops in 1648, and was partly destroyed by fire in 1698. It was entered by the rebels in 1715, and again by a larger force of them in 1745.

See Clarke, *Lancaster*, 1807, 2d ed. 1811, *Lancaster Records*, 1809; Hall, *Lancaster Castle*, 1864; Simpson, *History and Antiquities of Lancaster*, 1869; and a paper on "Roman Lancaster," by W. Thompson Watkins, in *Transactions of the Historic Society of Lancashire and Cheshire*, 1876.

LANCASTER, theshire city of Lancaster county, Pennsylvania, U.S., is situated on the Conestoga river, 68 miles west of Philadelphia by rail. It was founded in 1730 and incorporated as a borough in 1742, was the State capital from 1799 to 1812, and in 1812 became a city. It is laid out on the rectangular plan, and is unusually well built. The city is the seat of numerous charitable and educational institutions. Among the latter is Franklin and Marshall College, the chief educational establishment of the Reformed Church, which also maintains a theological seminary in connexion with it. The court-house is an imposing edifice, erected in 1853 at a cost of \$166,000. The county jail is a massive sandstone structure, with a tower 110 feet high, built at a cost of \$110,000 in 1851. Lancaster is the centre of one of the wealthiest agricultural regions in the United States. Its cotton, iron, and other mills are numerous and large, and it contains one of the most extensive watch factories in the country. Its tobacco trade requires nearly 100 large warehouses for its accommodation. A valuable trade in coal, lumber, leather, and grain is also carried on. James Buchanan, the fifteenth president of the United States, lived in Lancaster, and is buried there. The population in 1880 numbered 26,846.

LANCASTER, the chief city in Fairfield county, Ohio, United States, is situated on the Hocking river, about 30 miles south-east of Columbus. It is a well-built little

manufacturing town, busy with foundries, flouring-mills, and various manufactures, such as agricultural implements and machinery. The court-house cost \$160,000; and the city hall and public schools are also fine buildings. The neighbouring country is fertile, being especially noted for its grain, live stock, and vineyards. The population in 1880 was 6803.

LANCASTER, HOUSE OF. The name House of Lancaster is commonly used to designate the line of kings immediately descended from John of Gaunt, fourth son of Edward III. But the history of the family and of the title goes back a whole century further to the reign of Henry III., who created his second son, Edmund, earl of Lancaster, in 1267. This Edmund received in his own day the surname of Crouchback, not, as was afterwards supposed, from a personal deformity, but from having worn a cross upon his back in token of a crusading vow. He is not a person of much importance in history except in relation to a strange theory raised in a later age about his birth, which we shall notice presently. His son Thomas who inherited the title, took the lead among the nobles of Edward II.'s time in opposition to Piers Gaveston and the Spensers, and was beheaded for treason at Pontefract. At the commencement of the following reign his attainder was reversed and his brother Henry restored to the earldom, who, being appointed guardian to the young king Edward III., assisted him to throw off the yoke of Mortimer. On this Henry's death in 1345 he was succeeded by a son of the same name, sometimes known as Henry Tort-Col or Wryneck, a very valiant commander in the French wars, whom the king, for his greater honour, advanced to the dignity of a duke. The title was new in those days, for only one duke had ever been created in England before, and that was fourteen years previously, when the king's son Edward, so well known in history as the Black Prince, was made duke of Cornwall. This Henry Wryneck died in 1361 without heir male. Of his two daughters, Maud, the elder, was twice married, but died childless little more than a year after her father. The second, Blanche, became the wife of John of Gaunt, who thus succeeded to the duke's inheritance in her right; and on the 13th November 1362, when King Edward attained the age of fifty, he was created duke of Lancaster, his elder brother, Lionel, being at the same time created duke of Clarence. It was from these two dukes that the rival houses of Lancaster and York derived their respective claims to the crown. As Clarence was King Edward's third son, while John of Gaunt was only his fourth, it ought to have followed in ordinary course that on the failure of the elder line the issue of Clarence should have taken precedence of that of Lancaster in the succession. But the rights of Clarence were conveyed in the first instance to an only daughter, and the ambition and policy of the house of Lancaster, profiting by advantageous circumstances, enabled them not only to gain possession of the throne but to maintain themselves in it for three generations before they were dispossessed by the representatives of the elder brother.

As for John of Gaunt himself, it can hardly be said that this sort of politic wisdom is very conspicuous in him. His ambition was generally more manifest than his discretion; but fortune favoured his ambition, even as to himself somewhat beyond expectation, and still more in his posterity. Before the death of his father he had become the greatest subject in England, his three elder brothers having all died before him. He had even added to his other dignities the title of king of Castile, having married, after his first wife's death, the daughter of Peter the Cruel. The title, however, was an empty one, the throne of Castile being actually in the possession of Henry of Trastamara, whom

the English had vainly endeavoured to set aside. His military and naval enterprises were for the most part disastrous failures, and in England he was exceedingly unpopular. Nevertheless during the later years of his father's reign the weakness of the king and the declining health of the Black Prince naturally threw the government very much into his hands. He even aimed, or was suspected of aiming, at the succession to the crown; but in this hope he was disappointed by the action of the Good Parliament a year before Edward's death, in which it was settled that Richard the son of the Black Prince should be king after his grandfather. Nevertheless the suspicion with which he was regarded was not altogether quieted when Richard came to the throne, a boy in the eleventh year of his age. The duke himself complained in parliament of the way he was spoken of out of doors, and at the outbreak of Wat Tyler's insurrection the peasants stopped pilgrims on the road to Canterbury and made them swear never to accept a king of the name of John. On gaining possession of London they gave still more emphatic proof of their dislike to him by burning his magnificent palace of the Savoy. The young king himself shared the general feeling, and after a few years John of Gaunt ceased for a time to have much influence. Richard found a convenient way to get rid of him by sending him to Castile to make good his barren title, and on this expedition he was away three years. He succeeded, however, so far as to make a treaty with his rival, King John, son of Henry of Trastámara, for the succession, by virtue of which his daughter Catherine became queen of Castile some years later. After his return the king seems to have regarded him with greater favour, created him duke of Aquitaine, and employed him in repeated embassies to France, which at length resulted in a treaty of peace, and Richard's marriage to the French king's daughter.

Another marked incident of his public life was the support which he gave on one occasion to the Reformer Wycliffe. How far this was due to religious and how far to mere political considerations may be a question; but it is certain that, in one way or another, not only John of Gaunt but his immediate descendants, the three kings of the house of Lancaster, all took deep interest in the religious movements of the times. A reaction against Lollardy, however, had already begun in the days of Henry IV., and both he and his son were obliged to discontinue opinions which were believed to be politically and theologically dangerous.

Accusations had been made against John of Gaunt more than once during the earlier part of Richard II.'s reign of entertaining designs to supplant his nephew on the throne. But these Richard never seems to have wholly credited, and during his three years' absence his younger brother, Thomas of Woodstock, duke of Gloucester, showed himself a far more dangerous intriguer. Five confederate lords with Gloucester at their head took up arms against the king's favourite ministers, and the Wonderful Parliament put to death without remorse almost every agent of his former administration that had not fled the country. Gloucester even contemplated the dethronement of the king, but found that in this matter he could not rely on the support of his associates, one of whom was Henry, earl of Derby, the duke of Lancaster's son. Richard soon afterwards, by declaring himself of age, shook off his uncle's control, and within ten years the acts of the Wonderful Parliament were reversed by a parliament no less arbitrary. Gloucester and his allies were then brought to severe account; but the earl of Derby and Thomas Mowbray, earl of Nottingham, were taken into favour as having opposed the more violent proceedings of their associates. As if to show his entire confidence in both these noblemen, the king

created the former duke of Hereford and the latter duke of Norfolk. But within three months after the one duke accused the other of treason, and the truth of the charge, after much consideration, was referred to trial by battle according to the laws of chivalry. But when the combat was about to commence it was interrupted by the king, who, to preserve the peace of the kingdom, decreed by his own mere authority that the duke of Hereford should be banished for ten years—a term which was immediately after reduced to five—and the duke of Norfolk for life.

This arbitrary sentence was obeyed in the first instance by both parties, and Norfolk never returned. But Henry, duke of Hereford, whose milder sentence was doubtless owing to the fact that he was the popular favourite, came back within a year, having been furnished with a very fair pretext for doing so by a new act of injustice on the part of Richard. His father, John of Gaunt, had died in the interval, and the king, troubled with a rebellion in Ireland, and sorely in want of money, had seized the duchy of Lancaster as forfeited property. Henry at once sailed for England, and landing in Yorkshire while King Richard was in Ireland, gave out that he came only to recover his inheritance. He at once received the support of the northern lords, and as he marched southwards his followers became more numerous at every turn. The whole kingdom was soon practically at his command, and Richard, by the time he had recrossed the channel to Wales, discovered that his cause was altogether lost. He was conveyed from Chester to London, and forced to execute a deed by which he resigned his crown. This was rected in parliament, and he was formally deposed. The duke of Lancaster then stepped forward and claimed the kingdom as due to himself by virtue of his descent from Henry III.

The claim which he put forward involved, to all appearance, a strange falsification of history, for it seemed to rest upon the supposition that Edmund of Lancaster, and not Edward I., was the eldest son of Henry III. A story had gone about, even in the days of John of Gaunt, who, if we may trust the rhyming Hardyng (*Chronicle*, pp. 290, 291), had artfully got it inserted in chronicles deposited in various monasteries, that this Edmund, surnamed Crouchback, was really hump-backed, and that he was set aside in favour of his younger brother Edward on account of his deformity. No chronicle, however, is known to exist which actually states that Edmund Crouchback was thus set aside; and in point of fact he had no deformity at all, while Edward was six years his senior. Hardyng's testimony is, moreover, suspicious as reflecting the prejudices of the Percys after they had turned against Henry IV., for Hardyng himself expressly says that the earl of Northumberland was the source of his information (see note, p. 353 of his *chronicle*). But a statement in the continuation of the *Chronicle* called the *Epilogium* (vol. iii. pp. 369, 370) corroborates Hardyng to some extent; for we are told that John of Gaunt had once desired in parliament that his son should be recognized on this flimsy plea as heir to the crown; and when the earl of March denied the story and insisted on his own claim as descended from Lionel, duke of Clarence, Richard put an end to the discussion and imposed silence on both parties. However this may be, it is certain that this story, though not directly asserted to be true, was indirectly pointed at by Henry when he put forward his claim, and no one was then bold enough to challenge it.

This was partly due, no doubt, to the fact that the true lineal heir after Richard was then a child, who had just succeeded his father as earl of March. Another circumstance was unfavourable to the house of Mortimer—that it derived its title through a woman. No case precisely similar had as yet arisen, and, notwithstanding the pre-

more trustworthy, he found himself at leisure to accept some of the numerous invitations which crowded upon him, and to expound what he called "his system" by lectures in various towns. In this way many new schools were established, and placed under the care of young men whom he had trained. In a memorable interview with George III., Lancaster was encouraged by the expression of the king's wish that every poor child in his dominions should be taught to read the Bible. Royal patronage brought in its train resources, fame, and public responsibility, which proved to be beyond Lancaster's own powers to sustain or control. He was vain, reckless, and improvident. In 1808 a few noblemen and gentlemen came to his rescue, paid his debts, became his trustees, and founded the society which was at first called the Royal Lancasterian Institution, but was afterwards more widely known as the British and Foreign School Society. With the strongest wish to retain his services and to treat him with liberality, they soon found that he was impatient of control, and that his wild impulses and heedless extravagance made it impossible to work with him. He quarrelled with the committee, set up a private school at Tooting, became bankrupt, and in 1818 emigrated to America. There he met at first with a warm reception, gave several courses of lectures which were well attended, and wrote to friends at home letters full of enthusiasm and of high hopes for future usefulness, not unmingled with bitter denunciations of what he called the ingratitude and treachery of those who had been associated with him in England. But his fame was short lived. The miseries of debt and disappointment were aggravated by sickness, and he settled for a time in the warmer climate of Caraccas. He afterwards visited St Thomas and Santa Cruz, and at length returned to New York, the corporation of which city made him a public grant of 500 dollars in pity for the misfortunes which had by this time reduced him to lamentable poverty. He afterwards visited Canada, where for a time his prospects brightened. He gave lectures at Montreal, and was encouraged to open a school which enjoyed an ephemeral success, but was soon abandoned. A small annuity provided by his friends in England was his only means of support. He formed a plan, however, for returning home and giving a new impetus to his "system," by which he declared it would be possible "to teach ten thousand children in different schools, not knowing their letters, all to read fluently in three weeks to three months." But these visions were never realized. He was run over by a carriage in the streets of New York in October 1839, and was so much injured that he died in a few hours.

As one of the two rival inventors of what was called the "monitorial" or "mutual" method of instruction, his name was prominent for many years in educational controversy. Dr ANDREW BELL (*q. v.*) had in 1797 published an account of his experiments in teaching, and Lancaster in his first pamphlet, published in 1808, frankly acknowledges his debt to Bell for some useful hints. The two worked independently, but Lancaster was the first to apply the system of monitorial teaching on a large scale. As an economical experiment his school at the Borough Road was a signal success. He had one thousand scholars under discipline, and taught them to read, write, and work simple sums at a yearly cost of less than six pence a head. His tract *Improvements in Education* described the graduation of ranks, the system of signals and orders, the functions of the monitors, the method of counting and of spelling, and the various devices he adopted for punishing offenders. Bell's educational aims were humbler, as he failed to "elevate above their station those who were doomed to the drudgery of daily labour," and therefore did not desire to teach even writing and ciphering to the lower classes. The main difference between them was that the system of the one was adopted by ecclesiastics and Conservatives,—the "National Society for the Education of the Poor in the parishes of the Established Church" having been founded in 1811 for the propagation; while Lancaster's method was patronized by the *Edinburgh Review*, by Whig statesmen, by a few liberal Churchmen, and by Nonconformists generally. It was the design of Lancaster and his friends to make national education Christian,

but not sectarian,—to cause the Scriptures to be read, explained, and recited in the schools, without seeking by catechisms or otherwise to attract the children to any particular church or sect. This principle, since almost universally adopted by the school boards of England, was at first vehemently denounced as blasphemous and mischievous, and as especially hostile to the Established Church. To do this in justice, it must be owned that the rival claims and merits of Bell and Lancaster were urged with more passion and unfairness by their friends than by themselves. Yet neither is entitled to hold a very high place among the world's teachers. Bell was cold, shrewd, and self-willing. Lancaster had more enthusiasm, a genuine and abundant love for children, and some sagacity in devising plans both for teaching and governing. But he was shiftless, wasteful, and unmethodical, and incapable of sustained and high-principled personal effort. His writings were not numerous. They consist mainly of short pamphlets descriptive of the successes he attained at the Borough Road. His last publication, *An Estimate of the Chief Elements and Transactions of his Own Life*, appeared in America in 1833, and is characterized, even more strongly than his former writings, by looseness and incoherence of style, by egotism, and by a curious incapacity for judging fairly the motives and the merits of his friends or his foes.

Subsequent experience has not justified the sanguine estimate of the *Edinburgh Review*, who so early as 1810 described Lancaster's method as "a beautiful and inestimable discovery, a plan now in eight ways near to perfection, by which education could be placed within the reach of all classes." We have since come to believe that intelligent teaching requires skill and previous training, and that even the humblest instruments are not to be well taught by those who have only just acquired them for themselves, or to be attained by mere mechanical drill. But in the early stages of national education the monitorial method served a valuable purpose. It brought large numbers of hitherto neglected children under discipline, and gave them elementary instruction at a very cheap rate. Moreover, the educational results attained were in no sense contemptible. The little monitors were often found to make up in brightness, tractability, and energy for their lack of experience, and to teach the arts of reading, writing, and computing with surprising success. And one cardinal principle of Bell and Lancaster is of some importance. They regarded a school, not merely as a place to which individual pupils should come for guidance from teachers, but as an organized community whose members were much to learn from each other. They sought to place their scholars from the first in helpful mutual relation, and to make them feel the need of common efforts towards the attainment of common ends. (J. G. F.)

LANCELET (*Brachistoma* [or *Amphioxus*] *lanceolatum*). This creature, the lowest in the scale of fishes, with which class it is generally associated, lacks so many characteristics of vertebrates generally that some naturalists regard it as the type of a separate division. It is of small size (about 3 inches long), compressed, semi-

Lancelet (*Brachistoma lanceolatum*). *a*, mouth, *b*, abdominal pores, *c*, vent.

transparent, pointed at both ends, without limbs, but with a low fold of the skin, representing the median fin of fishes. The mouth, surrounded by tentacles, is situated below the anterior end of the body, the vent at a short distance from the opposite end. The water which has been received through the mouth for the respiratory function, as well as the spawn, are expelled by another opening in front of the vent (*porus abdominalis*). The skeleton is extremely rudimentary, and consists almost wholly of a simple notochord; neither skull nor ribs or limbs are developed. The lancelet possesses no brain or organ of hearing, and no kidneys. The heart retains the embryonic condition of vertebrates, is tubular and without chambers, the blood is colourless. Thus the lancelet shows unmistakable analogies to invertebrates, among which, indeed, it was placed by its first describer, Pallas; and as, besides, the earliest stages of its development are almost identical with those of invertebrate animals, it may well be regarded as a form intermediate between the two great divisions of the animal kingdom, viz., the vertebrates and invertebrates.

The lancelet has been found in numerous localities of

the temperate and tropical zones, sometimes in deep water, but more frequently in shallow sandy places of the coast, probably it is much more common than is generally supposed, but easily escapes observation on account of the transparency of its body, and the rapidity with which it buries itself in the sand. It is noteworthy that the first two specimens from which the species became known, although discovered at an interval of more than fifty years, were found on the Cornish coast. The first fell into the hands of the Russian naturalist Pallas, who took it to be a slug, and described it in 1774 under the name of *Limnaea lanceolata*. The second was found by Couch in 1831, who recognized it as a fish and sent it to Yarrell. Since then it has been met with on other parts of the British coast, in North America, the West Indies, Brazil, Peru, Tasmania, Australia, and Borneo. For further details of its organization we refer to the article *IMBRYOLOGY*.

LANCWOOD is a straight-grained, tough, light, elastic wood obtained from the West Indies and Guiana. It is brought into commerce in the form of taper poles of about 20 feet in length and from 6 to 8 inches in diameter at the thickest end. Lancelwood is principally used by carriage-builders for shafts; but since the practice of employing curved shafts has come largely into use it is not in so great demand as formerly. The smaller wood is used for whip-handles, for the tops of fishing rods, and for various minor purposes where even grained elastic wood is a desideratum. The wood is obtained from two species of *Guttaria*, a genus belonging to the natural order *Anonaceae*. The black lancewood or carleeri of Guiana (*Guttaria virgata*) is a tree which grows to a height of 50 feet, of remarkably slender form, and seldom yields wood of more than 8 inches diameter. The yellow lancewood tree (yardi-yari of Guiana) is of similar dimensions, found in tolerable abundance throughout Guiana, and used by the Indians for arrow-points, as well as for spars, beams, &c.

LAN-CHOW-FOO, the chief town of the Chinese province of Kan-suh, and one of the most important cities of the interior part of the empire, stands on the right bank of the Yellow River. The population is estimated by Gustav Kraitner (Bela Szechenyi expedition) at half a million in 1878. The houses, with very few exceptions, are built of wood, but the streets are paved with blocks of granite and marble. Silks, wood carvings, silver and jade ornaments, tin and copper wares, fruits, and tobacco are the chief articles of the local trade. Tobacco is very extensively cultivated in the vicinity. Since the occupation of Keshgar by the Chinese, the provincial governor resides three years at Su-chow and three years at Lan-chow-foo.

LANCIANO, the chief town of a circle in the province of Chieti, Italy, is situated on three hills, about 5 miles from the Adriatic coast. It is one of the most beautiful cities in the Abruzzi Citatiore, and has broad regular streets, and several fine buildings. The cathedral, an imposing structure with a fine clock-tower, is built upon bridges that span the gorge of the Feltrino, and is dedicated to our Lady of the Bridge. The churches of Santa Lucia and Santa Maria Maggiore, built on the sites of heathen temples, and the theatre, also deserve notice. Although the industry and trade of the town have declined, a considerable miscellany of manufactures is still carried on. The textile industry, dealing with flax, hemp, silk, wool, and cotton, is the leading one; iron-working, rope-making, and the manufacture of wax, soap, cream of tartar, &c., follow. There are four yearly fairs. In 1872 the population was 8758; including the suburbs it was 16,842, or, embracing the commune, 17,840.

Lanciano claims a respectable antiquity for, although Flavius Arde or Arre Fructicianus is to be placed about a mile from the present town, there is no doubt that under the early empire the

present site was occupied by a town, as the oldest of the bridges on which the cathedral stands was erected by the senate and people of Avannum, under Duclatun. During the Middle Ages Lanciano was of considerable importance, and enjoyed various privileges, chiefly of a commercial nature.

LANCRET, NICOLAS (1660-1743), was born in Paris on 22d January 1660, and became a brilliant painter of light comedy, but of light comedy which reflected the tastes and manners of French society under the regent Orleans. His first master was Pierre d'Ulin, but his acquaintance with and admiration for Watteau induced him to leave D'Ulin for Gillot, whose pupil Watteau had been. Two pictures painted by Lancret and exhibited on the Place Dauphine had a great success, which laid the foundation of his fortune, and, it is said, estranged Watteau, who had been complimented as their author. Lancret's work cannot now, however, be taken for that of Watteau, for both in drawing and in painting his touch, although intelligent, is dry, hard, and wanting in that quality which distinguished his great model; these characteristics are due possibly in part to the fact that he had been for some time in training under an engraver. In 1719 he was received as Academician, and became councillor in 1735, in 1741 he married a grandchild of Boussault, author of *Leopold at Court*, but he survived his marriage only two years, dying, in his eighty-fourth year, on 14th September 1743.

The number of his paintings (of which over eighty have been engraved) is immense; he executed a few portraits and attempted historical composition, but his favourite subjects were balls, fairs, village weddings, &c. The British Museum possesses an admirable series of studies by Lancret in red chalk, and the London National Gallery shows four paintings—the Four Ages of Man (engraved by Desplaces and L'Armoise), which have been cited by D'Argenville amongst the principal works of Lancret. See *D'Argenville, Vie des Peintres*; and Ballot, *Éloge de M. Lancret*.

LAND, in the sense in which it will be used in this article, which treats especially of its possession and tenure, includes that portion of the earth of which industry has rendered either the surface or the mineral riches underneath available for human requirements. It forms thus the storehouse from which nearly all human wealth is drawn, since it nourishes the animals and plants which supply mankind with food and clothing, and yields the stone, the coal, and the metals which make existence possible and progressive. The history of its use is therefore a main element in the history of our race, and the manner of its tenure and employment lies at the root of political and economic science. In the present article it is proposed to sketch in outline the historical development of the ideas relating to land, and briefly to point out the leading principles which influence its tenure and beneficial employment under present circumstances.

The history of land commences with the division of men into tribes, for the division of tribes involves distinction of territory. The earliest age, when men lived solely on wild fruits or on the produce of the chase, may still be pictured to us in the habits of the North American Indians, while the second or pastoral stage is represented in modern times by the life of the Tartars of the Asian steppes. In both these conditions an immense tract of country is absorbed in the support of a small population, but the hardships of existence, aided sometimes by organized systems of child-murder, serve to keep the inhabitants within the limits of subsistence. Under such circumstances each tribe jealously guards its own territory from intrusion by others, but within its range all members of the community have equal and unrestricted rights of use. Among civilized nations the principle still survives. Each modern nation claims a special ownership in the fisheries within a certain distance of its coasts; but among the inhabitants of these coasts there is a common right to fish in the waters thus reserved. So also each modern state recognizes the shores as far as high water

mark, and the estuaries with their herds of wild fowl, as the common property of its subjects. Even inland game is still not individual property, and in countries where legal rights are so ancient or so modern as in the Channel Islands and the United States of America, the local law is alike liberal in allowing to every one the right of sporting over his neighbour's ground, except in so far as modified by express and recent legislation.

Village
tenants.

But the higher races very early discovered an ampler means of industrial existence than the natural produce of the earth affords. At what period in human history the artificial cultivation of plants was discovered it is impossible to say. We know that it was posterior to the division of the Aryan currents that flowed towards Hindustan and towards Europe, but before the subdivision of the latter, for the words denoting a field, a plough, and some species of grain have a common root in the Greek, the Latin, and the Germanic dialects, but not in the Sanskrit. But so soon as agriculture began it involved of necessity an approach to more settled habits. This change in the manner of life would combine with the fuller and more regular supply of food to promote a rapid increase of population. So long, however, as this did not exceed the resources of the territory belonging to the tribe, it would not of itself involve any change in the idea that its use was common to all. A certain portion of ground would be devoted to tillage, a certain number of the tribe would be appointed to perform the acts of cultivation, and the produce would be stored in the general barn. We have at the present day examples of such a system in some of the alpeuds of the Swiss canton of Valais, where a portion of the lands of the village is cultivated by joint labour, and the produce devoted to joint feasting. But it appears that in general this stage rapidly progressed to one of apportionment of the land in separate and smaller districts. The tribes, augmenting in numbers and perhaps in extent of territory, subdivided itself into villages, and each village exercised a tolerably independent rule over its own district. Within this range it still maintained a community of the forest and pasture, but the special skill and toil demanded by husbandry in most cases soon led to the appropriation to each family of a portion of the arable land in exclusive property. Still, however, the principle of common right prevailed so far that the village rulers changed every year the lots assigned for culture, so that one year of crop, followed by a relapse into natural growth for a succession of years, was the normal rotation. It is one which modern science cannot condemn, for where space is ample and the use of manure is unknown, there is no sounder method of cultivation. It is still, according to M. Leveley, exemplified in the Ardennes region of Belgium.

Private
property
in land.

It is at this stage that contemporary observers first describe the tenure of land in ancient times, and illustrations of its survival in modern periods grow abundant. These will be hereafter pointed out. But except in special circumstances it is obvious that progress could not stop here. As population increased in each district, the available hunting grounds would diminish, and at the same time the necessity of more extensive and more frequent cultivation of crops would increase. By this process, in the absence of manure, the land would inevitably become less productive. But just as it demanded more labour it would become more definitely appropriated to a single family, for those who laboured most would not willingly give place to those who had been less active. A stage would then be reached in which community of possession would be limited to the pasture lands of the village, and the arable lands would be possessed in permanence by each family. There generally was, indeed, while the territory still sufficed, a recognition of the right of each individual to an allotment from the

common land. But at last the period would come in which this could be no longer afforded, and when either the tribe must migrate in a body, or cast off a swarm to seek its fortunes elsewhere, or leave a certain number of its members without the privilege of landed possession, to obtain subsistence in services to the rest, or in trades. When the two former alternatives become impracticable, the third is the inevitable course. Private property in land becomes then established, and we have thenceforward a new system, involving consequences for good and evil which legislation seeks to regulate.

With this general notion of the course of development History it will now be convenient to trace, in some instances which will have most affected the world's progress, the history and the results of the use and appropriation of land.

In primitive Rome each household formed an absolute Primitive despotism, of which the father was the despot; households were united into gentes by derivation from a common ancestor, and the state consisted in a combination of gentes. To each household there was originally assigned a small portion (2 jugers, 12 acres) of land to be held in perpetuity as private property (*hereditas*), and it may be assumed that on the death of a paterfamilias each son would be entitled to a like amount from the common lands of the gens. These common lands formed the main possession of the gentes, and it appears that they were to some degree cultivated in common, as well as used for pasturage. The state, however, also held common lands, partly original, partly derived from cession by each conquered neighbor, and these were let for rent (*vectigal*) in so far as not partitioned out. Cicero (*De Rep.*, ii. 9, 14) says that Numa was the first who divided the conquered lands into private shares, but it is certain that the example was only partially followed. But by the time of Servius Tullius the original private portion of many households must have been greatly but unequally enlarged, for his new military organization was based on the obligation of service imposed on the freeholders (*asseclis*) as distinguished from the mere labourers and breeders of children (*proletarii*). The "classes" of the assidui were five, those who possessed 20 jugera (12½ acres), and who were specially designated classici, and those who possessed respectively 15, 10, 5, and 2½ jugera. The first class, or classici, were about the half of the whole number of assidui, the second, third, and fourth classes comprised each about one-eighth of the entire number, and the fifth class was slightly more numerous. The equites formed a separate order, based on the possession of a still larger extent of land. At the same time a register of land was established, in which each owner was required to enter his property, and which was revised every four years, and sales were directed to be made before two witnesses. These arrangements show that even at this epoch the system of separate private property was in full operation, and that the difference of wealth which it engenders had already reached an advanced stage.

The progress of conquest, which at once enlarged the territory, brought in tribute, and furnished slaves, rapidly increased such inequalities. Trade, which followed conquest, and in which capitalists made large fortunes, tended in the same direction. Very early in Roman legal history we come upon tenancy-at-will, under the name of *precarium*, which of itself showed that there must have been large estates capable of subdivision. But besides tenants, the extensive landowner had a household of retainers, clients, freedmen, and latterly slaves, who tilld his ground for his personal profit. Thus there would be little demand for free labour, and the petty husbandman, whose small inheritance was inadequate for a growing family, fell necessarily into debt. His land would then be seized under the strict Roman law of bankruptcy, and he himself

would sink into slavery, or at best into the already overcrowded class of labourers for insufficient hire. At the same time the conquered lands, which by theory were the property of the state, and to which every citizen had an equal right, were largely portioned out to the existing landowners, who held the chief posts and influence in the government. The revenues drawn from tribute were also farmed out to capitalists, and the taxes on the public were augmented in consequence of the permitted frauds of the collectors. At last came the crisis. The army, no longer representing the wealth of the state, but rather the proletariat, intimated, and from the Mons Sacer menaced the city. It was the commencement of the long struggle of which the successive *AGRIAN LAWS* (*l.s.*) were the landmark and remedies.

The object of these laws was well illustrated by the Licinian proposal (387 A.U.C.), nearly one hundred years after the first outbreak of discontent. It enacted that no citizen should hold more than 800 jugera of the public lands, that no one should graze more than one hundred oxen and five hundred sheep on the common lands, and that every landowner should be obliged to employ a number of free labourers proportioned to that of his slaves. But this, as all other laws proposed on behalf of the people, was coupled with political changes of which the main object was to open up new fields of ambition to those of the plebeians who were already opulent. When that object was attained, the agrarian remedies were suffered to fall into desuetude. The successful wars waged in the 6th and 7th centuries A.U.C. gave a temporary outlet to labour in the formation of agricultural colonies. But it at the same time immensely increased the number of slaves, who were treated as mere beasts of toil, to be worked out or sold off when no longer profitable. The free population, on the testimony of Cato and Polybius, diminished; the slave population increased, and became in many districts an organized danger to public safety. A century later the Gracchi again endeavoured to restore health to the body politic by a distribution of the state lands among the proletariat. The attempt was stifled in blood, but the necessity of the measure was proved by the fact that a full generation later Cn. Julius Caesar carried out the same reform.

The time for remedy was, however, past. The great estates (*latifundia*) had already been created; they were respected by the reformers, alike popular and imperial, and their inevitable growth swallowed up the small farms of new creation, and ultimately destroyed Rome. For its misadventure was gone; the wealth of millionaires could not purchase back honesty or courage; and the defence of mercenaries failed to form any barrier against the wars of hardy northern invaders. Pliny's words "*latifundia perdidit Italiam*" embrace the truth, yet more fully made clear in many a generation after he wrote.

We shall now examine the systems prevalent in the nations by which the Roman empire was overthrown. Two great Roman writers, Caesar and Tacitus, have given us a vivid picture of the German customs showing us the tenure of land in its earliest forms. Caesar (*De Bell. Gall.*, vi.) says of the Germans of his time:—

"They are not much given to agriculture, but live chiefly on milk, cheese, and flesh. No one has a fixed quantity of land or boundaries of his property, but the magistrates and chiefs every year assign to the communities and families who live together as much land and in such spots as they think suitable, and require them in the following year to remove to another allotment. Many reasons for this custom are suggested: one is that they should not be led by permanence of residence to renounce the pursuits of war for agriculture, another that the desire of extensive possession should not induce the more powerful to seize the land of the weaker, another that they should not construct their houses with greater care to keep out heat and cold, another that the love of money should not excite parties and disputes, and lastly that the mass of the people might remain con-

tented with the justice of an arrangement under which every one saw his position as comfortable as that of his next neighbour. As to the tribes themselves, their chief glory is to have their territory surrounded with as wide a belt as possible of desolated waste. They deem it not only a special mark of valour that every neighbouring tribe should be driven to a distance, and no stranger should dare to reside in their vicinity, but at the same time they view it as a measure of precaution against the risk of sudden attacks."

A hundred years later the description of Tacitus shows that a certain modification of habit had been induced. Bringing together the leading particulars, we find he speaks of Germany as "covered with woods and morasses, the land fairly fertile but unsuited for fruit trees, well adapted for pasture, and carrying numerous herds of small sized polled cattle, in which the chief wealth of the natives consisted." But they seem no longer to have changed their actual dwellings every year, but to have

"Built them with a certain rough solidity, and in villages, though the houses were not contiguous, but each was surrounded by a space of its own. The right of succession by children was recognized, and in default of children brothers and uncles took, but there was no right of making a will. They preferred to secure property by war rather than by industry. Interest on loans was unknown. The land was apportioned (to villages apparently) according to the number of cultivators, and divided among them according to their rank, there being ample room for all. Every year they changed the arable land, which formed only a portion of the whole, not attempting to make labour vie with the natural fertility and abundance of the soil by planting orchards or setting out gardens and fields, but content with a single crop. Their food consisted chiefly of wild fruits, freshly killed game, and cereals, their drink was a liquor prepared from barley or wheat, fermented like wine. Their slaves were not kept in the house, but each had a separate dwelling and an allowance of food, and they were treated with humanity, as servants or tenants."

These institutions were then obviously based on the existence of an ample supply of unenslaved and common land. But the natural increase of population, combined with the pressure put on the Germanic tribes from the east by the Slavs, made their territories too small for their ambition, if not for their maintenance, and five or six succeeding centuries were marked in the history of Europe chiefly by successive Germanic conquest and occupation of western and southern territory. The enormous increase of power and possession made it impossible for the original tribal government to survive; the great generals developed into kings and emperors, and their lieutenants, more or less independent according to individual capacity and distance from the capital, became dukes and counts. Gradually military authority, embracing the old idea of the land being the property of the state, evolved the new notion of feudalism. The sovereign represented the state; to him in that capacity land conquered from the enemy, or forfeited by unsuccessful rebellion, became subject, and he granted it to his followers on condition of faithful service in war. They promised to be "his men," and from their own tenants they exacted in turn the like promise on the like conditions. The general insecurity made even free owners willing to buy the support of the sovereign on similar terms. Thus by degrees, less by derivation from the ideas of Roman law, to which it is sometimes attributed, than by the mere necessity of the times, and as a consequence of the incessant state of warfare in which mankind existed, there came to be established the feudal doctrine that all land was held of the sovereign on condition of suit and service, and that each immediate tenant of the sovereign was entitled to sub-infeudate his possession on the same principles. Gradually the further attributes of property were added; service in war was commuted into rent, and the peaceful service of tilling the lord's reserved domain. The right of hereditary succession became grafted on the personal grant; the power of sale and devise followed. Local usages still had influence, but it may be said broadly that from about the 10th century private property, subject to feudal

conditions, became the principle of the tenure of land in Europe.

Thus, however, some nations in which feudalism has struck no root, or at least has not succeeded in seriously modifying the original type of common possession. It will be best to advert to some of them before proceeding further with the history of feudalism in its modern development.

India.

The Indian branch of the Aryan stock has preserved with great fidelity the original notion of the possession of land. The village, consisting of detached houses and surrounded with the district belonging to it, forms still a self-regulating community. It is a legal person, to which the state looks for its rights, but which when performing them is free from internal state interference. It holds the forest and pasture ground in common property, allowing their use to each person entitled to the village rights. To each family is further apportioned a measure of arable land, but the stage is in general passed at which this portion is changed in successive years, and it is therefore the hereditary property of the family. But it is not in strictness subject either to will, to mortgage, or to sale. It is divisible on the death of the head of the family among his children, any of whom may transfer their shares to another member of the village, but not, except with its leave, to a stranger. These ancient customs have to some extent been modified by the introduction of English law, which, among other things, has subjected the villagers to the grinding exactions of the money-lenders, by giving creditors the security of an English mortgage. It cannot but be regretted that the desire to not justly which has led to the change should have been misled by the idea that whatever institution exists in England is necessarily and everywhere else equally equitable and necessary.

Harold
peoples.

In Europe the Slav peoples, the latest arrival of Aryan stock in Europe, have preserved best the ancient characteristics of land tenure. Checked in their advances to the south-east, they have formed a narrow borderland in Bulgaria, Servia, Croatia, and Dalmatia, between the Germans on the one side and the Turks on the other. Here, therefore, we have the case of a population growing within a restricted area, under circumstances which prevented the development of extensive military sway, and its consequent feudalism. Accordingly we find prevailing a system midway between the ancient communism of the Germanic tribes and the institution of private property. The tribes have become broken up into families. Common lands, except where there is mountain or forest, have been partitioned into the separate ownership of families. But within the families there is still a strong sentiment of community. In the Serbian and Bulgarian villages each family household consists of probably several generations, all housed under the same roof or within the same outlying. The head of the family is judge rather than master; any member of the family may depart, but in so doing he abandons his claim to the family property, a claim, however, which in some cases may revive should he return to the paternal home. All who remain work in common at their appointed duties, and share in common the produce. The family possessions are inalienable; the share of each member is untransferable.

Russia.

To the north and east the faculty of unlimited emigration to the unoccupied lands of the steppe permitted or enforced the preservation of a still earlier type of common property. When the Russian village found its lands inadequate to its growing population, it threw off a swarm. The emigrants travelled in a compact body till they passed beyond the limits of present cultivation, and then took up their position on such lands as pleased them. For their protection against the aboriginal hunters who still roamed over the plains they built their houses on the uniform plan

of an enclosed village, and the same reason concurred with native habit to induce them to maintain the system of common pasturage, and of united cultivation of the land apportioned to cropping. When the central government became strong enough to assert its sway over the scattered settlements, it levied its tax on the *mir*, or village community, and the community apportioned the amount per capita among its members. But, as land was ample in extent for all, it gave to each male, from the moment even of birth, a right to a share. When the shares became inadequate a fresh migration took place.

Serfdom took its rise in the prohibition of these migrations. Forbidden to depart to new lands, the peasants were compelled to submit to the demands for their labour either of the Government, where it held estates in the neighbourhood of a village, or of nobles to whom grants of land had been made by the czar. Generally they were thus forced to give half their time to labour for their master. But they still continued possessors of their share in the village lands, and entitled to apply the other half of their time to its cultivation.

When emancipation came, their rights were regulated on the same basis. The village was maintained as an industrial and fiscal organization. But each peasant was declared to be entitled to a certain fixed minimum of land for his own property, varying according to the district, but on an average about 12 acres. For this, in so far as being in excess of the village lands it had to be made up from the land of adjoining owners, he is required to pay either service, to the extent of forty days in the year, or rent, at an average rate of about 2s. 4d. per acre. Such provisions can only be temporary. They resemble much those which prevailed in Germany prior to the modern reforms in tenure. They subject the peasant, untaught and unaccustomed to habits of individual energy, to a tax which he is not able to meet, and the suffering and complaints which are the consequence are at present general throughout Russia.

In Switzerland also there has survived a system only slightly altered from that of the original communities. For here also conquest with its attendant feudalism was stayed, and freeman and free institutions survived the wreck which war made throughout western Europe. In the forest cantons especially there still exists an essential community of land right. The inhabitants possess separately and by ordinary rules of inheritance certain portions of land. But in several cantons the bulk of the land, both arable, forest, and pastoral, forms the allmend of the state, or of the commune,—the common property, to which every descendant of the original inhabitants has a right. This common land is either partitioned out by lot to each person entitled, or is let for a rent, which is applied to the common benefit, or is made the subject of common labour, and the produce of bread and wine is devoted to common merry-makings. When the arable land is divided among cultivators, the period allowed before repartition is from five to nine years, and it is stated that so strong is the feeling of common interest that the shortness of the time does not interfere with the highest cultivation by each successive occupant. In some districts it furnishes farms of 20 acres to each family, in others it only suffices for allotments of a few peches.

In France the custom of village proprietary survived in many districts down to the middle of the 17th century. But previous to the middle of the 18th century nearly the whole of the soil had passed into the hands of great landowners. The tenants and peasants were ground down with heavy exactions, not only in the form of rent, but of state taxation, and in services, or *corvées*, to be rendered to the lord or to the state. The artificial life of the nobles at court destroyed all sympathy between them and the

cultivators, and brought them to look on their dependants as little more than beasts of burden, valuable only for the profit that might be made of them. The feeling engendered on the other side broke out in the Revolution. The country estates, from which the *émigrés* had fled, were sold in portions, and in many cases bought in fee simple for a trifle by the former tenants of the farms. The law of equal division among children continued the process of subdivision. It proceeds in an augmenting ratio, and though a few large properties still subsist, the bulk of the land in France is now held in small properties. It is not, however, universally cultivated by the owner. There is a large proportion of tenants, holding generally under leases not exceeding nine years; and there is no doubt that the shortness of the term impairs production. Another evil is the *morcellement* caused by the law of compulsory division on inheritance, but this must not be understood as objected to chiefly on the ground of the small extent of ground held by each proprietor. The real disadvantage complained of by French writers on agriculture is that through successive family divisions each man's total property consists of a number of small plots scattered up and down, and the remedy desired is not an interference with the present law of succession, but only an enactment to facilitate exchange and consolidation of plots, so as to give to each cultivator his whole property within one boundary.

In France there are now about 2,000,000 properties under 12 acres, and 1,000,000 between 12 and 26 acres, while there are only 150,000 above 100 acres. Of the whole population there are 1,750,000 who cultivate their own land with their own hands, and who are not tenants, 850,000 who cultivate as tenants, and only 87,000 who cultivate by aid of a foreman or steward. Of farm labourers there are only 870,000. Belgium, Switzerland, Denmark, Norway, Sweden, and great portions of Italy are similarly divided into small holdings cultivated in general by the owner and his family.

In Germany, although feudalism was fully developed as a legal system and as the foundation of the aristocracy, it did not succeed in extirpating entirely the ancient rights of the people. A large portion of the land was held always as peasant properties, entirely free from any dues of service. Among these, in certain districts, there survived an organization essentially identical with that described by Tacitus. The village had its domain or mark, subdivided into the arable, the pasture, and the forest. In some cases the first of these was partitioned into individual and permanent properties, but in all the pasture and forest remained the joint property of the village. Instances, however, were not wanting even in our own days where the arable portion was subject to annual or less frequent repartition, and to apportionment by lot to each cultivator for the time which custom ordained. But even where this usage did not prevail, it was incumbent on all the villagers (as in Russia) to cultivate their several portions of the arable mark with the same crops and at the same seasons, for as soon as the crops were removed the whole community enjoyed a right of pasturage on the stubble. The rotation was, therefore, of the simplest, consisting in general of a triennial succession of wheat or rye as winter-sown grain, followed by oats and barley as spring-sown crop, and then fallow. It differed from the worse form of that of the ancient Germans in that the circumscribed limits of each village domain made it now impossible to allow to the whole arable mark a period of rest under pasturage.

But intermixed everywhere with the relics of the free village institutions, the tree of feudalism struck its roots, and carried with it a species of serfage. None who were not noble could as a rule purchase land. On the lands of the nobles the tenants were bound to give to their lord a

portion of their time in gratuitous labour. They held, however, their farms under conditions of permanency, subject to this tax of labour, and to a variety of small and irregular exactions of the nature of rent. On this state of things in Prussia the Stein and Hardenberg reforms took effect. They gave to every peasant the same power as the noble enjoyed to become a landowner. Between the nobles and their tenants they partitioned the land in absolute property, the landlord retaining one-third, the tenant receiving two-thirds. Common rights, and rents, were made purchasable by the owner of the soil at twenty years' purchase of their estimated value. And laws of 1821 and 1850 sanctioned the division of common lands among all who previously had an interest in them. To aid the peasantry in purchasing up the dues still payable to their former landlords, land credit banks were introduced in 1850. These institutions advanced to the peasant owner the sum necessary for the purchase of the old rights over his property, commuted as they had already been to a definite sum. The advance thus made constituted a first charge on the land, and was represented by debenture bonds for small amounts. The owner might pay to their credit, at whatever time and in whatever sums he was able, instalments towards their redemption, but he was bound to redeem them fully within fifty years.

These reforms have converted large parts of Germany into the property of small owners residing on and tilling their own land, free from obligation to any other person. There do not seem to be data for judging of the economic result, because statistics do not distinguish between the produce of small properties and that of the large properties intermixed with them. But the most careful observers agree that the social results are similar in Germany to what they are elsewhere. The peasants, attached to their holdings, form the most stable element in the community. Their love of the land shows itself in the high prices given for it, and, as we shall see elsewhere, in the tendency to borrow in order to purchase more. It can at least be said that, whatever be the hardships of their lot, they would not exchange it for any other.

The tenure of land in Great Britain may be traced with Great sufficient accuracy from the character of the elements of British which the nation is composed. Under the Celtic tribes there can be no doubt that the ideas which we now prevail among the ancient Irish and among the Scottish clans down to modern times formed the universal rule. The land was the possession of the clan; the chief was the leader but not the owner. The temporary and partial occupation by the Romans may have introduced the notion of absolute private property, and we may assume that it was at least asserted by each of the conquerors as cared to cultivate estates taken from the barbarians. But the withdrawal of the Romans, followed by the Saxon invasion, must have re-established the principle of common village ownership which formed the basis of both Celtic and German tenure. In the later Saxon period, however, there is no doubt that private ownership became gradually more extended. Then the feudal idea began to make progress in England, as it did at the same period on the Continent. It received an immense impulse from the Norman Conquest. William may not have claimed the whole land of England as his own, but the vast tracts which fell into his hands through confiscation of rights of so-called rebels were granted by him in the character of lord to such of the Saxons as he could trust, and to those of his own followers whom he desired to reward. When law began to form a system, the early Norman lawyers took this principle as the basis of their system. Thenceforth it became the undisputed maxim of English law, as well as of Scottish (with the exception of some isolated remains of "ndal."

rights in Orkney), that the sovereign was supreme lord of all the land, and that every one held under him as tenant in England, vassal in Scotland, names which have survived in legal theory and language down to the present day. They expressed then as now the unquestionable legal rule that there is no such thing in our system as an absolute private right of property in land, but that the state alone is vested with that right and concedes to the individual possessor only a strictly defined subordinate right, subject to conditions from time to time enacted by the community.

Within Scotland the feudal system has been preserved in remarkable purity. The majority of the larger estates, as well as many small ones, are still nominally held of the crown, and pay an annual rent, or "feu-duty," along with certain fines on succession or alienation, nor is the title of any heir or vendee complete till he has received the written acknowledgment of the sovereign. But each owner who holds of the sovereign may grant a subordinate estate to be held of himself as "superior" or lord, on such terms as he thinks fit, and the "vassal" thus constituted must in future obtain recognition of his title from his immediate superior, just as if he held directly of the crown. It is only within the last few years that the subordinate vassals thus holding have been allowed the means of commuting the services they had bound themselves to pay to the "subject superior," and of converting themselves into direct vassals of the crown, which forms the nearest approach to private property permitted by the law of Scotland.

In England feudal forms became partially obliterated at an earlier period. In 18 Edward I. parliament had put an end to subinfeudation. The services due by the crown's tenants were by a statute of Charles II. reduced to a form which left them merely nominal. But at a very remote period there had sprung up a tenure which in many respects was equivalent to feudal tenure. The serfs who cultivated the lord's lands, although at first subject to his absolute pleasure, yet, being left undisturbed for a considerable series of years, fell under the doctrine of English jurisprudence which recognizes custom as having the force of law. They gained thus a right of occupation in permanence, paying only such rents or services as were entered in the copy of the rolls of the manorial court, from which their tenure came to be designated copyholds. By degrees they obtained manumission from servitude, and with it the right of alienating or bequeathing the land they thus held. There were therefore two principal classes of property in England, freeholds, holding in general directly of the crown, and copyholds, holding of a lord of the manor, but both with indefeasible title subject to trifling services ascertained by custom or by statute. It would seem that in these two forms a very large number of those whom we now should call yeomen or peasant proprietors were established throughout the country. But in addition to these there were on the large estates a great number of those whom we should now properly call tenants-at-will, renting lands of the lord, and not established for a sufficient length of time to have acquired the status of copyholders.

About the middle of the 14th century English wool was found to be peculiarly well adapted to the use of the weavers of the Low Countries, and brought a high price. This led the owners of the large estates to substitute pasturage for tillage, and by consequence many of the cultivating tenants-at-will were evicted. Hence arose complaints precisely similar in motive and language to those which in our own times have been excited by the clearings in Ireland and the Highlands for the purpose of substituting sheep farming in place of husbandry by cottars and crofters. During the 16th century, probably for the same reason, the extensive wastes which covered a large part of England began to be

enclosed, to the consequent disturbance of a number of squatters (called at the time "champions," from *champs*) who had settled on them, and derived a not very sufficient subsistence from feeding a few animals on the commons. It is noticeable that both Fitzherbert and Tresser, the earliest English agricultural writers, and the latter himself one of the people, commend the enclosures, on the ground that the land so reduced to separate ownership produced much more than it had done as commons. But these causes, combining with the breaking up of the monasteries, and the absorption of church lands into the estates of the adjoining landowners, gave rise to much disorder and misery. Parliament attempted to deal with the causes and effects by enactments directed by turns against the high rate of wages, against the destruction of farm houses and cottages, and against the idle or unemployed tramps who roamed over the country. It was a period of dislocation of social relations, of which we are not now in a position to judge accurately. But undoubtedly the ultimate result was a considerable increase in the magnitude of the larger estates and farms, gained by a proportionate decrease in the number of both of smaller size. It is from this period that we must date the diminution of the class of yeomen which has been the theme of lamentation with economists and historians down to our own times.

Contemporaneously with these changes the law was receiving those adjustments which tended to preserve the large estates undiminished in the possession of their hereditary owners. Entails were sanctioned by statute (*De donis, 13 Edw. I.*), but broken down some two centuries later by the ingenious judicial devices of fines and recoveries. Trusts were invented by the churchmen, but attacked by parliament, only to be re-established under the technical name of trusts upon uses. Lastly, estates for life were invented, and, being skillfully combined with so much of the principle of entails as the courts had sanctioned, they have formed the still existing method by which family estates are preserved from dispersion. The rule of law is that all persons living at the date of a settlement may be restricted to mere estates for their own lives, instead of taking the fee simple with full right of alienation. In this way each son when he succeeds finds himself merely a tenant for life, and as such possessed of no power to prevent his own son from becoming owner in fee simple when he in turn shall succeed. But a father so situated is little inclined to leave to his son powers of which he himself is deprived, while his son is generally willing to barter his future liberty for a present liberal allowance. Thus father and son strike a bargain; the father buys the son's surrender of his future right, and the son, for a price, agrees to submit himself to the restraints of being merely tenant for life when his father shall die. The process repeated from generation to generation has re-established in practice the system of entails which the courts had abrogated as contrary to public policy, and which every writer from Bacon downwards has denounced as hurtful to the nation.

Similar rules prevailed in Scotland. But, as entails were there of later introduction, they were much more strict, and from 1680 to 1848 land might be settled in an endless succession of unconvertible life estates. In the latter year an Act was passed which, with a good deal of complication, substantially limits the right of creating life estates to one generation as in England. In 1875 another Act introduced the useful principle that the owner of a life estate might in certain circumstances buy up and extinguish some of the contingent interests in succession to his own at their present value, ascertained by computation based on the expectation of life.

The system of entails, or of creation of estates for life only, which has thus prevailed for several centuries in the

United Kingdom, is sufficient to account for the fact that the large estates have continually augmented, in size and number, by the corresponding absorption of the small properties of yeomen. These small properties are seldom subjected to strict settlement. The owners occasionally fall into difficulties, and then their land is sold to pay their debts. They are frequently moved by natural affection either to divide their estates among children, or to subject them to charges for children other than the heir, and thus also tends to bring them into the market for sale. But the large adjoining properties, the owners of which have been induced by family pride to limit their right to mere life interests, are not liable to be sold for debt. The immediate possessor may be crippled during his life, but his heir will succeed to the estate free from incumbrance by any prior possessor. In the same way the powers of each successive owner to charge the estate for younger children, and the liability to sale for payment of such charges, is restricted within narrow limits. These properties therefore continue undiminished; and when a small adjoining freehold comes into the market, it is seldom that the owner of the larger estate cannot find the money to effect its purchase. Once obtained, it is included in the next settlement of the larger estate, and thus permanently withdrawn from the operation of natural processes of disintegration. On the whole, it follows that large estates tend to grow, and in precisely the same proportion small ones tend to disappear.

It may be further observed that this tendency is materially aided by an absurdly bad and expensive conveyancing system, and by the law of mortgage. The costs of transfer of land are so enormous in England that they form a very large percentage on the price of small properties, and preclude any one from purchasing them, with the motive of making a living upon them. So also the insecurity of title, which is greatest on the smaller properties, because they have been dealt with less carefully, compels any owner who needs an advance to pay usurious interest, by which his ruin is speedily effected, and the property brought to sale. On the other hand a large property changes hands at less comparative expense, and the necessity of a sale to meet temporary difficulties is at less cost obviated by mortgage, which permits the owner to hold on till some windfall of legacy or marriage once more reinstates him in easy circumstances, and enables him to take advantage of his poorer neighbour's necessities. This does not mean that he cheats the small proprietor in the bargain. On the contrary, the desire of the rich to segment their estates induces them to give more than the real worth for the smaller properties. But this concurrence of circumstances tends steadily in the direction of increasing large estates and diminishing from age to age those that are small. The practical result is easily shown by a few figures. The cultivated land of the United Kingdom (including parks and permanent pastures, but not mountain or waste) amounted in 1890 to 47,515,747 acres. The total acreage is 77,635,301 acres. By the Domesday Book of 1875 it appeared that one-fourth of the total acreage (excluding plots under 1 acre) is held by 1200 owners, at an average for each of 16,200 acres; another fourth by 6200 persons, at an average of 3160 acres; another fourth is held by 60,770 persons, averaging 380 acres each; and the remaining fourth by 251,830 persons, averaging 70 acres each. (Oxoid) Peers, in number about six hundred, hold rather more than one-fifth of all the land in the kingdom. Thus one-half of the whole territory is in the hands of only 7400 individuals; the other half is divided among 813,500 individuals. The total population of the United Kingdom (not including Channel Islands and Isle of Man) in 1881 was 36,100,000, so that barely one in a hundred owns more than an acre of soil.

Of tenant farmers there are in Great Britain 561,000, in Ireland 600,000. About 400,000 of these in Great Britain, but above 500,000 of those in Ireland, occupy less than 15 acres of cultivated soil, the average size of the remaining holdings being in Great Britain about 160 acres, in Ireland 75 acres.

In the countries which have been colonized from England the system of small properties rather than large has been generally adopted. The first settlers in New England carried with them the idea of the village community. They decreed that grants of land should be made to each household to the extent of 90 acres, but the rest of the land apportioned to each village was to be held in common. This system has been now expanded into the homestead United States law (see HOMESTEAD), prevailing over the whole United States, in virtue of which a citizen of the States is entitled to a free grant of 160 acres ($\frac{1}{4}$ square mile) on condition of bringing it into cultivation within five years. The influence of slavery in the Southern States tended, as in Rome, to create large estates, but its abolition has arrested this course. On the whole, with exception of a very few gigantic farms in the extreme west, it may be said that both the United States and Canada are countries of small farms, seldom exceeding 150 to 300 acres, and almost universally cultivated by the owner. The pastoral lands of Australia and New Zealand are still held in "runs" of immense extent, but whenever cultivation makes way there is a growing movement in the direction of opening them up to purchase in small farms.

The above sketch, imperfect as the limits of space have compelled it to be, of the history of land tenure throughout the world shows that it has pursued one unvarying course. Commencing in community of tribal possession, it has everywhere by degrees been appropriated to the village, then to the family, and at last to the individual. But in every stage the conditions of its enjoyment and use have been absolutely regulated by the community in reference to the general welfare. A history so uniform would seem to rest on principles of human nature, and to be incapable of reversal. Nevertheless in the present age two opposite parties have impugned its lessons. The one would revert to the almost prehistoric times when community of property, of labour, and of wealth formed the rule of existence. The other speaks of individual property, especially in land, as a sacred and indefeasible principle, and denounces every restraint or modification introduced by the state as spoliation. Between these extremes an infinite variety of ideas for more or less making land or its produce public property, or more or less restricting the right of the personal owner, have been put forward, and some, with some confusion, strenuously advocated. A brief attempt will now be made to discriminate between what in these ideas is sound and what is impracticable.

The principles of communism have unquestionably struck deep roots in the minds of large classes of the public, chiefly in Germany, but to no inconsiderable extent in other countries and even in England. Nor can they be dismissed as merely criminal and worthy of no answer but repression. The answer must rather be that they are based on hopes and beliefs in the capability of human nature for self-sacrifice, which we have no warrant in yet accepting as our practical guide. A golden age may yet return, in which all shall be for the country and no one for himself, and we may even imagine that such successive ages show its nearer approach. But at least it has as yet not come. In every community there are found a large number of individuals who would not work honestly except under the compulsion of self-interest or of close superintendence. No socialist scheme has yet been devised which copes with this tendency.

In all of them a vast hierarchy of official inspection would be demanded, which, even if adequate, would cut up the profits. In all of them relapse from freedom to experiment. For the case of the culture of land, an art involving such variety of method applied to such variety of circumstance, it seems, as yet, impossible to conceive arrangements by which joint possession could result in beneficial production. We know it even among families to be at present a hindrance and source of loss. Nor has any definite scheme been yet proposed by socialists to show how it could be worked by the state. Till its advocates at least do this, and permit us to judge as men of business of the practical effect of their system in a given area and with given machinery, it were waste of time to discuss their aspirations and their imaginary results.

Those who, at the opposite pole, refuse to admit the right of the state to impose such conditions on private property as it deems for the general benefit may be dismissed even more briefly. Not only do they show entire ignorance of the history of land tenure at all times, but they belie the daily action of British legislation. Parliament seldom lets a session pass without making laws which assert the right of the state to take possession of property for public or private benefit, to tax it, and to restrain or regulate the rights of its owners over it. Nor is there any theory of the basis of property which does not tacitly admit that it is subject to the authority of the community. If derived from occupation, it owes its title to the agreement of the community to support that title. If derived from labour, it is valid only for the life of the labourer, and whoever succeeds to him must take it, not as a gift from a dead man whose rights end with the grave, but as a gift from the state, which deems that there is advantage in encouraging labour by the certainty of transmitting its produce. In every view it must be admitted that the state, by whose regulations and force property is maintained, must have an unqualified right to prescribe the conditions under which it will confer its gifts on private individuals.

The general object of supporting private property in land is to increase its produce, by inducing the owner, through motives of self-interest and affection for his family, to bestow on it the greatest amount of labour. It is agreed by all practical authorities that the soil of Great Britain might be rendered greatly more productive by the increased expenditure of capital, which when explained means in one shape or other the larger employment of labour, both in effecting permanent improvements and in conducting the acts of cultivation. The interest of the public in strengthening the motives which may lead to such additional production is unquestionable. The soil is the support of the nation, furnishing to it primarily both its subsistence, its clothing, its fuel, and the raw materials of its trade with other countries. Some indeed argue that freedom of trade with other countries, permitting unrestricted import of all these articles, has rendered the profitable use of the soil at home comparatively unimportant. But this is inaccurate for several reasons. First, importation involves at all events the expense of all that labour which is devoted to the carrying trade. Secondly, it involves dependence on other nations for other articles than food, to an extent which may easily become fatal. If, for instance, agriculture in England were to employ less labour, because it was more profitable to import wheat for subsistence and cotton on which to employ labourers, there is not only the risk, sufficiently grave, that both may be stopped by war, but the ever present probability that manufacturing industry may be displaced by competition from countries where its raw material can be obtained without the cost of carriage, and

where in some cases labour may, owing to climate or a lower standard of living, be cheaper. Such a rivalry is already visible in America, in India, and in Russia. If through these causes the manufactures should decay, and the artisans be driven to emigrate, certainly the depopulated fields of Great Britain would be unable to maintain her in her present rank among nations.

An entirely opposite school has, however, stated a principle, which, though not applied by it to the question of the tenure of land, would if true be hostile to the application of further capital to the soil. Political economists (see, *e.g.*, Mill, bk. i. chap. xii.) have asserted that every successive application of capital to cultivation must be less profitable than the first. This is called the "law of diminishing production from land," and it has been said to be "the most important proposition in political economy." But the fact is that it is true only if the qualification be added "in the existing state of knowledge." That is to say, it is true that, if a given amount of labour applied in raising wheat, for example, will raise 16 bushels on an ordinary soil, twice the amount of labour will not, *per se*, raise 32 bushels on the same soil, or even 16 bushels on a very inferior soil. But chemistry and experiment tell us that if, instead of expending the second quantity of labour in merely ploughing twice instead of once, we spend it in purchasing and applying nitrogen, phosphoric acid, and potash in proper proportions to the soil, either directly as artificial manures, or still more cheaply as manure from animals whose food has contained these elements, we do get a return considerably more than double for the double amount of labour which the application involves. This is exemplified in the fact that rents rose about 20 per cent. in England when these appliances came into use, in spite of a stationary range of prices, showing that the additional capital thus devoted to agriculture gave a higher return than the capital that had been previously employed.

A further illustration may be found in the fact that the capital that has been expended by the Improvement Companies in England, under the supervision of the Inclosure Commissioners, has yielded on an average a return of 15 per cent. of increased rental on the expenditure, over and above the profit made by the tenant farmer (Caird). Since this average includes a few cases in which defective knowledge has led to loss, it is evident that, when capital is applied to agriculture with reasonable scientific knowledge and skill, it is capable of still yielding returns at a full average rate, even after payment of the salaries earned by the scientific and practical education which has directed its employment. Nor is there any reason to believe that the process has come, or nearly come, to an end. It certainly does not follow that soil is capable of unlimited production; for it is quite certain that its powers in this respect are sharply defined by the amount of light and heat which in any given situation the plants growing on it can receive. But it is becoming daily more probable that up to that limit advancing science and practical skill will tend to equalize the cost of production, making the application of labour to inferior soils as profitable as to superior, and making capital as productive when approaching the limit of its useful application as when it is, in the form of raw labour, applied to soils newly brought under cultivation.

But, on the other hand, the doctrine that the land can be made more productive by the application of more capital, and that the state has a strong interest in increasing production, is fatal to all that variety of proposals which have been made for what is called, in rather uncouth and exceedingly vague phrase, "nationalisation of the land." All of these start with the suggestion that the land of the country, being the property of the community, should be resuscitated.

Doctrine
of supremacy
of private
rights.

production
from land.

Nation-
alisation
of land.

by it for a new arrangement or distribution. In some schemes it is proposed that the state shall buy out the present owners, paying them the full value of the fee simple; in others it is proposed that the state shall simply resume the land on the death of the present owners, without paying any compensation to their heirs. Conceding the abstract justice of both propositions, it admits of little doubt that they would not be for the public benefit. Under the first the state would make a very bad bargain. Land, on account of its attractions as a subject of private property, brings a market price nearly 30 per cent. above its actual value. It sells usually at a rate computed to yield a clear return of not more than 3 per cent. But in order to bring this return the owner is obliged to lay out, in maintenance of buildings, drains, roads, fences, and other incidents, sums which on an average are not much less than a third of the net produce. If then the state is to buy at the rate of 3 per cent. what actually yields only 3 per cent., it is clear that the public will be a loser on the transaction. On the other hand, if the state is to take possession of land on the death of the present owners, either without compensation or with a compensation less than the market value, the result would be at once to stop all further improvement by the actual possessors. No one would spend money on that which was to pass, not to his own heirs, but to the public, and the land when it reverted to the state would be in a condition requiring enormous outlay to restore its exhausted fertility, and to remedy the general decay into which its appliances would have been suffered to fall. If again it is urged that the state might obviate this evil by offering compensation for the actual value of improvements which might be made, it can only be answered that private landlords and tenants have not yet found a method of satisfactorily ascertaining such value; that even when the principle is accepted tenants frequently prefer, when certain of not obtaining a renewal of their lease, to exhaust the land rather than trust to arbitration giving them an equivalent; and that this tendency would be enhanced when the state became the landlord and the valuers were appointed by it.

Supposing, however, the operation to be accomplished, and the state to have become the universal landowner, the next question is, What it is to do with the land? On this there is a still greater variety of suggestion. Some would have the land let by the state on lease merely, and would apply the rental to extinguish taxation. Others would have the state to sell in fee simple. But in both cases there arises the further question, To whom shall the advantage of a lease or a sale be given? Here there breaks out the dispute between the advocates of large and small estates and of large and small farms. Some would offer the priority of choice to the existing tenants; but, as this would result in the creation of a large proportion of estates or farms extending to hundreds or even thousands of acres, its superiority over the present system can only be considered as partial. Others would break up the whole land of the country into peasant properties, and even go so far as to furnish each with a house. But, considering that this scheme would further involve the abandonment of most of the existing farm houses and farm buildings, which would be quite useless to peasant proprietors, it would impose a heavy financial loss on the nation.

It must be further kept in view that there are only 47 millions of cultivable acres to be divided among 55 millions of persons, and that the acres are of every conceivable difference of value, dependent not merely on soil but on situation, climate, cropping, capability for improvement, and a thousand other circumstances. To divide these into plots of equal value would be a task of enormous expense,

and perhaps scarcely possible to be accomplished. But, if the plots are to be of larger size and unequal value, it must be again asked, How is the state to be guided in selecting the individuals to whom its special favours are to be given? And if it be said that the state would exact a rent proportioned to the value, and thus confer no favour, there would then arise the further question whether the rent is to be fixed in perpetuity, which means a gift to the lessees of all capability of improvement in the land, or whether it is to be adjustable by valuation at intervals, which merely leaves the lessees in the same position as the present lessees are. In the latter case nothing would be gained except that some would be dispossessed in order that others might be put in possession.

It is, however, insisted that in any case the state would have the advantage of drawing the rental of the land, and it is argued that this would do no wrong to the lessees, because it would be only the rental derived from the original value of the soil, and would not affect their profits from the capital and labour they employ on it. This principle, if sound, might, however, be applied with equal force to every other species of material wealth. The state would be quite as fully entitled to acquire, by purchase or by annexation on death of the owner, factories and consols, as it is to acquire land for which it has suffered the former owner to pay a price. But there is a greater disadvantage in the state becoming the universal landlord. A farm is dependent not only on the soil but on the seasons and the markets, and its profits cannot be guaranteed. A rent for the use of the mere soil may be far on an average of years, but occasionally there comes a series of years in which no rent at all can be paid without bankruptcy of the tenant. Private landlords can and do meet these bad times by concession and agreement, but the state can only act by laws, and in justice to the community it must be hard to its debtors. It is in fact the system which has been tried to be carried out in India, with a considerable variety of method, but with uniformity of failure,—a failure to be attributed mainly to the fact that state taxation, necessarily inflexible, is disastrous when applied to income so fluctuating as that from land must be. In fact a tenant, paying full value for the unimproved land to the state, would be in precisely the position occupied at present by an owner who is mortgaged up to the ears; and, since the rent is to be in perpetuity also, he would be unable ever to redeem himself from the burden. An occupant so situated is the most unhappy of men, and the worst of cultivators, and that the state should hold the mortgage over him would only make his position the harder.

These considerations apply also to the recommendations ^{the un-} which have been made that the land tax should be increased ^{correct} and that the "unearned increment in the value of land" ^{increment} should be appropriated by the state. Including tithe and local rates, land is taxed at present on an average of about 30 per cent. on its net profits. An additional tax on land would operate to prevent investment of capital on its improvement, since capital will not be invested where its returns are below the average. The "unearned increment in value of land" is often strikingly apparent in and near towns; but it does not exist in the bulk of agricultural districts. Corn has not risen in price within the last hundred years, and, if meat has, so has the cost of raising and importing the food of cattle. The rise in the value of agricultural land generally is not on the whole more than a fair return for the capital that has been invested in improvements, and for the immense sums that have been lost in the experiments out of which the improvements have sprung. The cases in which it is more than this would be incapable of being discriminated, and would not be worth the trouble if it were possible. The idea would probably

not have been started had it not been for the spectacle of the enormous fortunes accruing to those who have had the good luck to inherit or to purchase land useful for building purposes. If limited to such cases, the principle of the right of the community to resume the benefit arising from its own concentration in particular spots may be supported by different and very good reasons, due regard being had to the reimbursement to the private owner of all sums actually expended by him in purchase or building.

Mineral
wealth.

The right of the public to mineral wealth under the soil stands on as clear a footing. By the common law gold and silver mines belong to the crown, no matter who is the owner of the soil. The principle obviously applies equally to all minerals. They are a part of the country itself, not merely material from which profit can be extracted, and when they are gone they cannot be replaced. As the law forbids the selling of land to foreigners, it might with equal justice forbid the selling of coal for foreign exportation. The discovery of valuable minerals is often due to mere accident, and they resemble treasure-trove, which by law belongs to the crown. Nor would difficulty arise in working mines by crown leases or under crown superintendence. Where they already are worked it would be right to pay the estimated value to the private owner, since hitherto they have been deemed subject of private property, but all future increase or all new discoveries might justly be held to belong to the nation, without compensation to the owner of the surface who had no knowledge of their existence.

Regulation
of
distribution
of
land.

Approaching now the question how the state without actual resumption of the land may so regulate its possession as to encourage the maximum production from it, we are in the beginning met with the dispute between the advocates of large and small estates, the former cultivated by tenants, the latter by the owners. But we may first disembarrass this question from one source of confusion. Large estates are never cultivated in a block. They are invariably broken up into farms, sometimes indeed extending to several thousand acres, but far more generally ranging between the limits of 500 and 50 acres. Below 100 acres the tenant is usually himself the cultivator, with more or less assistance, and below 50 acres he will seldom require any assistance outside his own family. Now, as there is no advantage accruing from one landlord holding a number of such farms, we may state the question as regards cultivation as not being between large and small estates, but as being between farms of which the tenant does the work and those in which he only superintends the work of others.

Advantages
of
small
farms

Thus stated, the answer admits of no dispute. It has been already discussed in the article AGRICULTURE; but it may suffice to advert here to the conclusive argument derived from the superior efficiency and therefore cheapness and productiveness of the labour given by a man in working entirely for his own behoof, as compared with that which he pays others to do for him. It would scarcely be too much to say that capital in the form of personal labour will yield twice the return of capital employed in hired labour. It applies not merely to the man but to his wife, sons, and daughters, and not only to the total amount of work done, but to the zeal and care with which it is directed.

Against this advantage on the part of the small cultivator there is only to be set in favour of the large that he can better employ machinery. But, though he may be the first, he is not necessarily the only one to employ machinery. Reaping and mowing machines may be (and often are) employed on the smallest holdings; threshing machines are now made to be worked by hand or by one or two horses; even steam-engines are made with power down to one horse

or half a horse. Those very small machines are slightly more wasteful of coal for the power they give out; but on a small scale this is quite unappreciable, and is far more than balanced by the greater economy induced by their being driven by the owner himself. A very elementary resort to combination among small cultivators affords them in any case the same advantages as the large cultivator. Their energy and aptitude are not less, and with the advance of education may be directed with the same knowledge. Most persons connected with land know of many instances in which even at present the small cultivator is as advanced in his scientific practice as the larger. It is generally admitted that during the recent disastrous seasons the smaller farmers have been better able to meet their engagements than the larger. The reason is, not merely that their outlay is smaller in cost of labour, but that by close attention and the power of availing themselves of every opportunity they have suffered less actual loss than the farmer on a more extensive scale.

It is of course understood that, to enable a farmer of a small acreage to produce the same result as a larger holder, he must have the same advantages provided to him by investment of owner's capital. He needs the same buildings for farm purposes, the same drains and fences, in proportion to his extent of farm. But he does not need more; and, as his own house is only an equivalent for the labourer's cottage, which must in any case be provided, there is the saving of the more expensive residence which a farmer cultivating several hundred acres thinks himself entitled to. Again, the tenant's capital invested must also be as much in the one case as in the other. The small tenant ought to have as much and as good stock on the farm in proportion to its extent as the large. But he saves much capital in the item of wages, because, till profits come in, his own labour costs him only his own food, and even the rent of his house is postponed, so that it is probable that he will be able to spend on the land a capital larger in proportion than the extensive farmer at a greatly less actual outlay of money. Those who argue that the capital invested by the larger tenants is greater than that invested by the small cultivator forget that capital in agriculture must be measured not solely by expenditure of money but in a great measure by expenditure of labour to which a whole family may cheaply but effectively contribute.

The importance of encouraging investment of capital forms perhaps the main argument in favour of the system of cultivation by the joint interests of landlord and tenant. In this combination the landlord furnishes the land and (in Scotland always, in England frequently) the buildings, &c. The tenant's capital is therefore limited in its application to operations of tillage and manuring. The landlord's contribution is commonly estimated at five-sixths, the tenant's at one-sixth of the total capital employed, and while the landlord's yields less than 3 per cent interest, the tenant's has, by Mr Caird, been estimated as bringing in 10 per cent per annum. This, however, on an average of years and of farmers is probably too high an estimate. The conclusion, however, is drawn that the system is beneficial to the farmer because the capital required for permanent investment is advanced by the landlord at a low rate of interest, while the whole of the tenant's capital is invested at a high rate of interest. But in this argument it seems to be forgotten that the tenant's 10 per cent. includes not merely interest on capital subject to risk, but salary for time and skill, and is, therefore, not really 10 per cent. on capital. Now, undoubtedly, if any one desires to risk his whole capital in trade, he is entitled to at least 10 per cent. on it, and he makes, while prosperous, a large income. But if he prefers to invest five-sixths of it in a secure investment, yielding only 3 per cent., and to risk only one-sixth,

while at the same time giving his personal labour and skill, his income may be considerably smaller, but it will be to the same extent the more secure. It is entirely a question for each person to solve for himself, and it would be no national loss if a certain number of farmers were to elect to purchase farms of only one-sixth the extent of those which they occupy as tenants, and to cultivate them with their own labour. Or, if the present tenants should be reluctant to exchange their higher incomes, subject to the greater risk, for smaller but more secure incomes, it cannot be said that there is any national gain in their occupying land which in the hands of small owners would yield crops as large and at no greater cost, though with a different distribution of profits.

What is true in the argument appears to be this. It would be a distinct loss to the nation if landlords were to withdraw their capital from the land before other persons are prepared to put as much in. At present tenants in general cannot put in more capital, because they have not got more. They could not, therefore, buy their present farms. But they could buy farms of smaller extent, and on these raise crops fully as good. And if there were enough of other persons prepared to buy the remainder of the land, and to cultivate it themselves with equal skill, there would be equal advantage in their doing so. But, since skill in farming needs both education and practice, there are not enough of persons as yet possessed of these qualifications and also of the needful capital. Hence any sudden break in the present system of tenure by landlord and tenant would be hurtful to the country, leading to abstraction of capital, and worse cultivation and less produce. But a gradual process of change, permitting all persons who had capital (however small) and aptitude, to become owners and cultivators, would be a national benefit, since it would not diminish the capital employed, but would render it on the contrary more productive through the stimulus of being applied wholly for the benefit of the cultivator himself.

There is no doubt that the system of division of capital and rights between landlord and tenant is intrinsically bad. Neither is full owner, nor can do even with his own share exactly what is best for himself and the public. The landlord is generally short of means with which to make permanent improvements; in any case he can make none without the tenant's sanction, and of course he makes none unless the tenant agrees to pay him at least 3 but more often 5 per cent. The tenant, on the other hand, having only a temporary interest, spends nothing except when he sees a certainty of being repaid before the end of his term. Land, however, yields only slow returns, and much is thus left undone because the full profit cannot be reaped till after a lapse of years. The system of leases, universal in Scotland, palliates but does not remedy the mischief. It is recognized that the tenancy, usually of nineteen years, is in practice divided into three equal portions. The first is spent in restoring the exhaustion of the soil by the preceding tenant, the second gives a full profit, the third is (if no renewal of lease be expected) devoted to the gradual withdrawal of capital, with corresponding reduction of fertility. Compensation for unexhausted outlay is an excellent principle; but it has not yet been found so trustworthy in application as to afford sufficient security to induce the continuous application of capital till the end of the lease. It is very doubtful whether any form of legislative interference, passing beyond a mere enactment of equitable presumptions in absence of express contract, would improve the relation between the two parties, because such enactments when not agreeable to both parties can always be indirectly broken through. It is only cultivation by the actual owners that gives at once the freedom and security

necessary for full development of the capacity of the land and the adoption of the results of modern science.

The history of land tenure in Ireland illustrates these principles, and they in turn afford a standard by which to judge recent legislation. Leaving out of view a certain number of estates on which the landlord supplied, in addition to the land, the capital represented by buildings, drains, &c., in the greater part of Ireland he supplied nothing. The tenant, under a general custom of permanence of holding, in many cases did a great deal, but, as the custom was not enforced by law, the occasional seizure of his improvements caused a sentiment of alarm and distrust which seriously limited them. The Act of 1870 aimed at giving him additional security by not merely recognizing his right to compensation for his own outlay if he should be removed, but by imposing a fine on the landlord if he should evict a tenant. But, as it avoided to prohibit the landlord from raising the rent, the insecurity was just as great as before, while the introduction of a legal relation between the two parties led many landlords to restrict more than ever their expenditures on improvements. The Act of 1881, therefore, proceeded to the necessary consequence of fixing the rent, by means of a court of valuation, and of giving to the tenant a positive right to permanent occupancy, subject to a revaluation every fifteen years. But it is obvious that this scheme also, though valuable as an immediate palliative, fails to have the elements of a permanent settlement. The landlord will be less and less inclined to spend on improvements; and even if he desired to do so the tenant can, and in nearly every case will, prevent him, for the plain reason that he will not desire the landlord's share in the joint property to be increased. Yet the tenant will on his part be impeded from full confidence in making improvements, even when he has the means, lest at the next valuation his own outlay may be valued against him. The interests are no longer joint but conflicting. Thus far the remedial legislation has only succeeded in reaching the stage in which Prussia stood before the reforms of Stein and Hardenberg were proposed, when nobles and serfs had both certain legal rights, which neither could attack, but which neither could convert into independent property. But the Prussian method of reform by apportioning the land to each party in absolute property, but in fractions representing their respective interests, could not be applied in Ireland, both because the holdings are in general too small to bear partition, and because the landlords have not, as in Prussia, been in the habit of cultivating their own domain, and they would, therefore, again introduce the vicious system of letting to tenants even that part which might be assigned to them in unencumbered fee. The state will, therefore, have to become the intermediary of transfer, but the better course would probably have been that it should at the first have assumed this function on the over-rented and ill-managed estates, leaving those which were fairly rented and liberally managed unaffected by legislation which they did not need.

The legal basis of the recent land legislation in Ireland is, however, as it was in Prussia, the recognition that prescriptive possession, even under a title of mere tenancy, confers a right to continuance of such possession. The same principle formed the basis of the conversion of copyholds in England from being tenancies at will into tenancies in perpetuity. It might justly be applied still in cases in Great Britain in which tenancies have continued without change for a long period. Especially it might be applied to check the system of "clearances" in the Highlands, where the right of the crofters to continue in possession rests on the original community of possession by the tribe, and is fortified by an almost immemorial continuance of possession by each family.

Owners should be cultivators.

North-
gers
objec-
tionals

In any view of ownership, however, whether on a large or small scale, it is obviously of prime importance that the owner should be possessed of cash sufficient to make the improvements required. This is a situation in which an owner who is already in debt cannot possibly be. To hold land subject to a mortgage is, therefore, to hold it under conditions disadvantageous to the owner, the tenant, and the nation. The evil is intensified by the fact that an owner so burdened possesses an apparent estate far in excess of his real means, and occupies a social station involving an expenditure that exhausts his resources in every way. It would be greatly for his pecuniary advantage if the law were such as would compel him to sell sufficient land to pay off his debts, for he would thus relieve himself of interest at the rate of 4 to 5 per cent. by selling property which gives only 2 or 2½ per cent. on the price that would be obtained. His net income would then not only be greater, but as his apparent estate would be smaller he would not be tempted to live in so expensive a style, and he would thus have the means of gaining larger returns from his property by improving it. It has, therefore, been proposed to abolish mortgages by prohibiting land from being made security for special debts. It would then form part of the general assets of the owner, liable equally for all his debts; and any one who desired to raise money would practically be obliged to do it by sale instead of by pledge. Land would be confined to its proper purpose as a means of production, instead of being injured for that purpose by being used as a means of credit.

Life in-
terests
objec-
tionals

The same principle forbids that life interests in land should be permitted. The mere tenant for life or holder under settlement or entail has actually in frequent instances a motive against cultivating his estate to the best advantage. If he is not on good terms with the next in succession, or if, as so often happens, the next successor is a distant relative, while the present tenant has only daughters, his motive, and often indeed his duty, must be to impoverish the estate in order to save money for those whom he loves best. In a less degree, if he has a large family, he must save money out of the rents of the estate to provide for his younger children, and he is correspondingly disinclined to lay out money on improvements which must accrue only to the benefit of his eldest son.

All these considerations are equally applicable to small as to large estates in land. It is as injurious to the peasant cultivator as to the extensive landowner to be hampered by a burden of debt, or to be deprived of the power of directing who shall be his successor. In France, in Germany, in Switzerland, in America, and in India, indebtedness is the great curse of the small farmer. The money-lender is a far harder master than the landlord, for he has less mercy and less interest in being merciful.

Devotion
of land
to pur-
poses of
luxury

It has been assumed throughout these observations that land is to be applied to its natural use, the production of the materials of food and clothing. In the hands of rich persons it is, however, sometimes devoted to purposes of luxury and enjoyment, such as the formation of large parks, game preserves, and deer forests. Within moderate limits such purposes may be defended on the plea that man does not live by bread alone but by all the enjoyments which he is framed for appreciating, and which in moderation contribute to mental health. But they are most defensible when open to the most general enjoyment, and it is peculiarly to the credit of many of the English nobility that they open their parks to the resort of the neighbouring villagers and townspeople, often at some inconvenience to the owners themselves. On the other hand, the conversion of large tracts of ground to the object of preserving game, which implies at the same time exclusion of the public, and diminution of production of food, for the sole recreation

of one or two individuals, is a use of national resources which has, since the formation of the New Forest by William the Conqueror, been generally reprobated. The latest phase of its development has been in the conversion of immense areas of the Highlands of Scotland into grouse shootings and deer forests, a process which involves the removal of the small tenantry, and even, in the case of deer forests, the ceasing to graze cattle and sheep. The landowners find that the game rents are much more profitable to them than the farming rents, but it is at the cost of the nation, which suffers a diminution in the employment of labour and in the production of food, and which consequently must see its inhabitants emigrate and pay for imported grain, wool, and meat grown by foreign labour. The ultimate remedy of this abuse will probably be found in measures tending to break up large estates into small ones, for the system requires the reservation of extensive areas free from the presence of man, and the interposition of small cultivated holdings would effectively destroy it.

It may, however, be well to notice here an argument *Gruing*, which has been sometimes pushed to excess. It has been urged that even grazing should be prohibited on the ground that from the same area a much larger production of food can be obtained in the shape of corn than of meat. The difference is indeed very striking. An acre of good land will yield 40 bushels of wheat, weighing 2600 lb, while in grass it would yield only 250 lb of meat, and it is still more striking if we deduct the water from each, when we have 2200 lb of dry grain against 188 lb of dry flesh and fat. But man being semi-carnivorous must have a proportion of flesh, and the value he assigns to meat as compared with corn shows very correctly its relative importance in the human economy. The fact is that the cost of market prices, which are now regulated by the production and demand of the whole world, assigns to dry meat and fat a value just about twelve times as great as that of corn, and consequently an acre of grass land gives a profit quite equal to that of an acre of wheat. Nor could the equality be impaired even if we were all to become vegetarians. For the most ardent disciples of that faith admit the necessity of using milk, and about 2 pints of milk is a necessary addition to a daily allowance of 2 lb of grain for health and the performance of work. But to furnish this quantity of milk throughout the year nearly an acre of ordinary land would be required, or as much as would give about half a pound of meat per day, so that there are no means by which we can dispense with the use of a considerable extent of land for the feeding of animals, by which its produce is converted into the proximate products demanded by the human constitution, and the amount to be so used is best determined by the demand of the public.

The conclusion to be drawn from the review of the whole questions relating to tenure of land is that they are best solved by freedom of action of individual owners, guided by self-interest and family affection, and only restrained by law when the special circumstances of a high civilization introduce abnormal conditions. Since these motives operate most fully and healthily when land is held in small estates, it only remains to glance at the methods which in different countries and by different authorities have been suggested to encourage subdivision.

The most general method is that of equal division of the *Methods* inheritance among children. It is compulsory in the *of sub-division* Channel Islands, in France, and several other European countries, and it forms the rule of intestacy under the law of gavelkind in Kent, in most of the British colonies, and in the United States. To its existence in the latter form no reasonable objection can be taken. To its compulsory enforcement there applies, though in a modified degree, the same objections that apply to a compulsory rule of

primogeniture, with the additional objection that it tends to limit the growth of population. Parents who are compelled to give an equal portion to every child avoid the risk of subdivision by not having many children, a course which, if commendable when the Old World seemed in peril of over-population, is a source of national impoverishment when the world affords profitable employment for hundreds of millions more than exist. Among the children themselves the certainty of succession abates the sentiment of filial duty, and the desire to bestow a special bounty on one child who is favoured above the rest may sometimes induce the parents to spend less than they otherwise would in the improvement of the whole estate.

Subdivision of property may, however, be gradually effected by prohibiting excessive bequests. It has always been recognized that the state has an unquestionable right to deal with property at the moment of its transmission from the dead to the living, and no objection could be made to a rule that no one should leave by will or through intestacy more than a certain sum, or land of equivalent value, to one individual. This would not generally affect the desire during life to amass and improve property, because the improved value would still be available for division among all whom the owner wished to benefit. But it would in one generation reduce all estates of abnormal size to properties of such dimension as in the opinion of parliament would be most serviceable for cultivation, and consequently most conducive to national benefit.

The abolition of the right to raise money by mortgage of land would also tend to promote its subdivision, since an owner in debt would be obliged to sell a portion of his estate in order to pay his debts. The improvement of conveyancing, which would follow from the general abolition of all interests in land except that of simple and absolute ownership, would also facilitate the sale of land. The leading principle which should guide legislation is in short that land should be made capable of the easiest transmission from one owner to another, and of the fullest use by him to whom for the time it belongs. The ordinary motives of human nature will then occur in transferring it from those who are least to those who are most capable of making it productive, and of inducing each successive owner to bestow on it the labour and outlay by which the maximum of beneficial production will be secured.

LANDAU, the chief town of an official district in the Palatinate of the Rhine, Bavaria, is situated on the Queich, about 18 miles north-west of Carlsruhe. Among its various interesting buildings are the Gothic church, dating from 1285, and the monastery, founded in 1276, and now converted into a brewery. There is a considerable trade, and some manufacture. The population in 1875 was 7579.

Landau was taken no less than seven times in the Thirty Years' War. At the peace of Westphalia it was ceded to the French, and was generally held by France till 1816, when it was restored to Germany; in 1816 it was annexed to Bavaria. In 1871 its fortifications were finally destroyed.

LANDEN, JOHN, a distinguished mathematician of the 18th century, was born at Peckirk near Peterborough in Northamptonshire in 1719, and died 15th January 1790, at Milton in the same county. Most of his time was spent

in the pursuits of active life, but he early showed a strong talent for mathematical study, which he eagerly cultivated in his leisure hours. In 1762 he was appointed agent to the Earl Fitzwilliam, and held that office to within two years of his death. He lived a very retired life, and saw little or nothing of society; when he did mingle in it, his dogmatism and pugnacity caused him to be generally shunned. He was first known as a mathematician by his essays in the *Ladies' Diary* for 1744. In 1766 he was elected a Fellow of the Royal Society. He was well acquainted and *au courant* with the works of the mathematicians of his own time, and has been called the English D'Alembert. In his *Discourse* on the "Residual Analysis," in which he proposes to substitute for the method of fluxions a purely algebraical method, he says, "It is by means of the following theorem, viz.,

$$\frac{x^m - a^m}{x - a} = x^{m-1} + \frac{a}{x} + \left(\frac{a}{x}\right)^2 + \dots + \left(\frac{a}{x}\right)^{m-1} \quad (n \text{ terms})$$

(where m and n are integers), that we are able to perform all the principal operations in our said analysis; and I am not a little surprised that a theorem so obvious, and of such vast use, should so long escape the notice of algebraists." The idea is of course a perfectly legitimate one, and may be compared with that of Lagrange's *Calcul des Fonctions*. His memoir (1775) on the rotatory motion of a body contains (as the author was aware) conclusions at variance with those arrived at by D'Alembert and Euler in their researches on the same subject. He reproduces and further develops and defends his own views in his *Mathematical Memoirs*, and in his paper in the *Philosophical Transactions* for 1785. But Landen's capital discovery is that of the theorem known by his name (obtained in its complete form in the memoir of 1775, and reproduced in the first volume of the *Mathematical Memoirs*) for the expression of the arc of an hyperbola in terms of two elliptic arcs. To find this, he integrates a differential equation derived from the equation

$$t - \pi \sqrt{\frac{m^2 - a^2}{m^2 - x^2}},$$

interpreting geometrically in an ingenious and elegant manner three integrals which present themselves. If in the foregoing equation we write $m = 1$, $a = k$, and instead of t consider the new variable $y = t + (1 - k)$, then

$$y = (1 + k)x \sqrt{\frac{1 - x^2}{1 - k^2}},$$

which is the form known as Landen's transformation in the theory of elliptic functions; but his investigation does not lead him to obtain the equivalent of the resulting differential equation

$$\frac{dy}{\sqrt{1 - y^2} \sqrt{1 - k^2 y^2}} = \frac{(1 + k)dx}{\sqrt{1 - x^2} \sqrt{1 - k^2 x^2}}, \quad \text{where } k = \frac{1 - k'}{1 + k'},$$

due to what appear to Legendre, and which (over and above Landen's own beautiful result) gives importance to the theorem as leading directly to the quadric transformation of an elliptic integral in regard to the modulus.

The list of his writings is as follows:—*Ladies' Diary*, various communications, 1744-1780; papers in the *Phil. Trans.*, 1764, 1780, 1788, 1771, 1775, 1777, 1785; *Mathematical Tractations*, 1786; *A Discourse concerning the Residual Analysis*, 1788; *The Residual Analysis*, book I., 1784; *Amusements on Dr. Sturges's Method of computing the Sun's Distance from the Earth*, 1771; *Mathematical Memoirs*, 1780, 1788.

LANDER, RICHARD (1804-1884) and JOHN (1807-1889), two brothers, African explorers, were natives of Cornwall. Richard Lander accompanied the Niger expedition of 1825-27 as Clapperton's attendant, and on the death of his master at Sokoto on the Niger in April 1827,

returned to England, and published an account of the expedition in 1830. He exhibited such capacity for the work of African exploration that the British Government decided to send him out to determine the course of the lower Niger, which was then unknown. In the expedition he was accompanied by his brother John, who was better educated than Richard, and who went as an unsalaried volunteer. Leaving England in January 1830, the brothers landed at Badagry on the Guinea coast on March 23. They then travelled north-east to Boco on the Niger, and after a trip north as far as Yaorie they proceeded down the river in canoes. At Kirree they were taken prisoners by the natives, and after some delay were conveyed down the river and managed to escape in a brig, the river journey lasting about five months. The Landers were thus able to lay down with approximate correctness the lower course of the Niger, and to prove that it discharged by a delta into the Gulf of Guinea. They lost many of their records at Kirree, but published a detailed narrative of their exploration in three volumes, in 1832 (*Journal of an Expedition to explore the Course and Termination of the Niger*, by John and Richard Lander). In 1832 Richard went out again at the head of a well-equipped expedition, organised by Liverpool merchants for the purpose of opening up trade in the Niger, and founding a commercial settlement at the junction of the Benue with the main river. After making several successful journeys, he was again on his way up the river in January 1834, when on the 20th the party were attacked by natives, and Lander was wounded. He died of his wounds at Fernando Po on February 6. John Lander died November 16, 1839.

LANDES, a department in the south-west of France, formed of portions of the ancient provinces of Guyenne, Béarn, and Gascony, lies between 43° 30' and 44° 32' N. lat., and 0° 8' E. and 1° 30' W. long., and is bounded on the N. by Gironde; on the E. by Lot-et-Garonne and Gers; on the S. by the Basses Pyrénées; and on the W. (for 68 miles) by the Bay of Biscay. Its greatest length, from the mouth of the Adour in the south-west to Arr on the border of Lot-et-Garonne in the north-east is 89 miles; its greatest breadth from east to west is about 62 miles, and the area 3599 square miles. The department takes its name from the *landes*, sandy plains formerly covered by the sea, which occupy its greatest portion, and extend into the departments of Gironde and Lot-et-Garonne. South of the Adour, the chief river of the department, the country changes in character, and is called *La Chalosse*,—a hilly region, which the various rivers coming down from the Pyrénées intersect like the rays of a fan. The Gabas, Lay, and Gave de Pau are the principal tributaries of the Adour on the left. On the right it is joined by the Midouze, formed by the junction of the Douze and the Midou. North of the Adour the plain of Landes slopes gently to the north-west, and empties its waters partly by the Leyre which flows into the Aracchon basin, partly by brooks which run into the lakes at the foot of the dunes which fringe the coast. The soil of this plain is naturally sterile. It is composed of a mixture of sand, clay, and organic debris, and rests on an embol of tufa (*dioze*) which is impermeable to water; for three-quarters of the year, consequently, the waters, settling on the almost level surface and unable to filter through, transform the country into marshes and morasses, while in summer the heat of the sun, drying up the marshes, produces malarious fevers. But during the last twenty-five years much labour has been expended in draining operations. More than 1850 miles of ditches have been dug, and of the 1,112,000 acres which were unutilized in 1850 two-thirds have now been reclaimed, or planted with forest trees. The coast, for a breadth of about 4 miles, is bordered by a succession of

dunes or sand hills, in several ranges parallel to the shore, and from 150 to 800 feet in height. Driven by the west wind, which is most frequent in these parts, the dunes were slowly advancing year by year towards the east, burying the cultivated lands and even the houses. Brémontier, towards the end of the last century, devised the plan of arresting this scourge by planting the dunes with maritime pines. At the present time upwards of 98,000 acres have been thus treated, and the forests already supply some fine timber to the navy. In the south-west, cork trees take the place of the pines. On the eastern side of the dunes is a series of lakes (Cazan or Sanguinet, Biscarosse, Aurellian, St Julien, Léon, and Soustons), which have been separated from the sea by the heaping up of the sand. The salt water has escaped by filtration, and they now are quite fresh. The climate of Landes is the Gironde, which prevails from the Loire to the Pyrénées. Snow is almost unknown, even in winter; the spring is rainy, the summer warm and stormy. The prevailing wind is the south-west, and the mean temperature of the year is 53°·6 Fahr., the thermometer hardly ever rising above 82° or falling below 14° Fahr. The annual rainfall in the south of the department in the neighbourhood of the sea reaches 56 inches, but diminishes by more than half as we proceed to the north-east. Most of the department is still in the condition of *landes*, traversed by flocks of sheep, which are kept by shepherds perched upon stilts. These *landes* are gradually giving place to forests, and in extent of forest land this department occupies the first place in France. In the *Chalosse*, the richest portion of the department, the vine, maize, wheat, millet, tobacco, vegetables, hemp, and flax are cultivated; yet, small though the population is, the department does not produce corn enough for its own consumption. The exploitation of the forests forms the chief industry. The resin obtained from the maritime pine furnishes by distillation essences of turpentine, and from the residue we have various qualities of resin, which serve to make varnish, tapers, sealing-wax, and lubricants. Tar, and an excellent charcoal for smelting purposes, are also obtained from the pine-wood. From the numerous iron furnaces in the department there was, in 1878, an output of 17,000 tons smelted with charcoal, and 8139 tons during the first six months of 1881. The cultivation of the cork tree is also very important; its produce is much sought after both by French and by foreign manufacturers. There are also a number of brick and tile works, and potteries. The department has several mineral springs, the most important being those of Dax, which were frequented even in the time of the Romans. The population of Landes in 1876 was 303,508, or 84 inhabitants to the square mile. In 1801 the population was only 224,272. The department includes three arrondissements (Mont-de-Marsan, Dax, and St Sever), 28 cantons, and 333 communes. Mont-de-Marsan is the capital of the department. It is noticeable that in its long extent of coast it has no considerable port. Opposite Cape Breton, however, where the Adour formerly entered the sea, there is, close to land, a deep channel where there is safe anchorage. It was from this once important harbour of Cape Breton that the discoverers of the Canadian island of that name set out.

LANDLORD AND TENANT. It has been explained in the article *LAND* that in the United Kingdom no such thing as the absolute private ownership of land is recognised. The absolute and ultimate owner of all land is the crown, and the highest interest that a subject can hold therein is a tenancy. The largest estate known to the law, that in fee simple, is after all only a holding in which the owner of the fee stands to the lord in the relation of a tenant. All estates in land would therefore fall under this heading, but on the present occasion, as in common parlance, it is

restricted to those holdings which amount to the hiring of land. That tenure has nowhere the same importance as in the British Isles,¹ where practically the whole agricultural land of the community is cultivated by persons who merely hire it for a limited time from the owners. The social and political bearing of this fact does not fall within the scope of the present article, but it shows the important application of the rules of law which we proceed to state.

Dismissing the tenant character of the landlord, and regarding him as owner pure and simple, we have to deal with him as contracting to give up the occupation of his land to another person, the tenant, for a consideration. In Roman law, the tenure of *emphyteusis* (a kind of perpetual lease originally used by corporations but afterwards by private owners), and *precarium* (or tenancy-at-will) occupied to some extent the place of the law of landlord and tenant in our system. The proper contract of letting and hiring (*locatio-conductio*) as applied to land had the following incidents. The *conductor* (tenant) was not technically regarded as possessor; i.e., he had not the aid of the interdicts in case of eviction either by the landlord or by strangers. The *locator* alone could sue in respect of the land, but the *conductor* had a personal action against the *locator* on the contract. The landlord was bound to make delivery to the tenant and permit him to occupy for the term agreed upon, and to keep the premises in proper repair. The landlord was answerable for any injury arising to the tenant from the defective condition of the premises. Finally, "the landlord must permit the tenant to carry away not only movables but even fixtures placed by the tenant, provided the tenant did not injure the house." A tenant of land was entitled to compensation for unexhausted improvements except such as he had specially agreed to execute in consideration of a lower rent" (see *Hunter's Introduction to Roman Law*, p. 121). On the other hand, the *conductor* had to pay the rent subject to deductions for the total or partial loss of the crops, to exercise due care during his term, and give up possession at its expiration.

In English law the following terms are of fundamental importance. The landlord so contracting is said to *demise* his lands, and the instrument by which the contract is expressed would be a *demise or lease*. The word *lease* is very generally limited to the writing in which the agreement to let is expressed, but any contract of letting is as on the side of the landlord a *demise*, and so between the parties a *lease*. A lease or demise means a grant of the exclusive possession of the thing in question for a definite time; permission merely to use the thing for a particular purpose or on a particular occasion is a licence and not a lease. A lease further implies that the lessor intends to give up possession to the defendant for a determinate time, no matter how it may be expressed, and is so distinguishable from a mere agreement contemplating that the parties shall on some future occasion enter into the relations which a lease creates. The consideration promised by the tenant or lessee is termed the *rent*. The period of occupation prescribed is the *term*.

The Statute of Frauds (29 Car. II. c. 3) enacts that "all

¹ In the United States the law is substantially the same as in England. The remedy by distress is said to be "becoming unpopular in the United States, as giving an undue advantage to landlords over other creditors. In New England the law of attachment on mesne process has superseded the law of distress. In New York, North Carolina, Georgia, Ohio, Alabama, Tennessee, Mississippi, and Louisiana, it is modified or abolished (see *Bouvier's Law Dictionary*, art. "Distress"). On the other hand, a speedier remedy than ejectment has been provided for landlords, by which they may be "reinstated, upon notice of a day or two, in case where a tenant abandons the premises before the end of the term without surrendering the lease, leaving rent in arrear, continue to hold over after the expiration of his term, or has become unable or unwilling to pay for the use of the premises" (*Bouvier*, art. "Landlord and Tenant").

leases, estates, interests of freehold, or terms of years, not put in writing by the parties so making or creating the same or their agents thereunto lawfully authorized by writing, shall have the effect of leases or estates at will,"—except leases for a term not exceeding three years, whereon the reserved rent amounts to two-thirds of the improved value. When rent is accepted by the landlord, the tenancy-at-will is enlarged into a tenancy from year to year. By a later Act, 8 & 9 Vict. c. 106, a lease required by law to be in writing must now be made by deed.

A lease, like other written contracts, should clearly indicate the parties to and the effect of the contract. A date is not necessary, and in the absence of a date, it will take effect from the day of delivery. But it must contain the names or other sufficient description of the parties, a description of the premises to be demised, words appropriately expressing the fact of a present demise (*demise or lease* being the usual words), the date at which the term is to begin and end, and the rent. The rent or other services created in favour of the landlord by the lease are said to be *reserved*. And when things that would otherwise belong to the tenant under the lease, as woods, timber, trees, minerals, &c., are expressly withheld, they are said to be *excepted*. But these expressions do not apply to conditions giving to the landlord the right of shooting, fishing, and so on over the land, or any right of way or other easement thereon. That can be vested in the landlord only by a re-grant from the tenant, no matter by what expression the right is created. Such grant must be by deed; and, where a lease of the land would be effectual without a deed, a reservation of such rights as we have mentioned would not. There is a good deal of misconception on this point, for landlords are not generally understood to hold their right to game on grant from their tenants.

In point of length of term tenancies are distinguishable as being either at sufferance, or at will, or from year to year, or for a term of years. A tenancy by sufferance exists where a person having obtained possession on a lawful title holds over after the title has determined, e.g., a tenant on lease for a term of years after the expiration of the lease. It has been said that this is not an estate at all but a fiction to prevent the continued possession being regarded as a trespass. It is not created by contract, but arises by implication of law; it is not assignable; and possession of the land can be resumed without previous demand to the so-called tenant. A tenancy-at-will exists when the tenant holds by agreement with the landlord, determinable at the will of either. Any signification of a desire to terminate the tenancy, whether expressed as "notice" or not, will bring it to an end. A tenancy from year to year is a tenancy for one year certain, and is determinable only by a six months' notice to quit, such notice terminating on an anniversary of the date of the beginning of the tenancy. A tenancy from year to year must last at least one year, but may be determined then, if a six months' notice has been given; if not so determined it must endure for another year, again determinable in like manner, and it will so endure until terminated by such a notice. Apart from express agreement, it will be implied in law when, for example, the landlord accepts rent yearly or by parts (e.g., quarters) of a year. Similarly monthly tenancies, chiefly of furnished houses or lodgings, would be implied from the fact of rent being paid once a month. But that is a matter of presumption only. If it were proved that the parties agreed to a tenancy-at-will only, payment of rent by the quarter or any other period would not enlarge the nature of the tenancy. Lastly, a lease may be for a specified term, and the tenancy in that case comes to an end by the lapse of time, without notice to quit or any other formality.

These are the agreements by which the relations of

landlord and tenant, as the phrase is generally understood, are created, and they are the agreements under which most of the buildings and nearly the whole of the agricultural land are held by their occupiers. These are tenancies, however, in which the grantor would not be spoken of as the landlord. Such is the position of the person to whom land is granted for his own life, or, it may be, for the life of another, called in technical language tenant for life and tenant *per autre vie*. These are not cases of letting and hiring—to which the relation of landlord and tenant is confined—but are modes of holding property. The same may be said of the terms for long periods of years created for carrying out trusts in the settlement of estates. The tenant in such cases is the person who, when we come to the agreement of letting and hiring, stands in the place of the landlord. It may be observed that the law-books distinguish in point of dignity between estates for life, the lowest kind of freehold estates, and estates for any term of years however long, which are only leasehold estates.

Reverting to the agreement of letting and hiring, it may be laid down that any person having an interest in land may, to the extent of that interest, create a valid tenancy. A tenant for years or even from year to year only may stand in his turn as landlord to another tenant. If he profess to create a tenancy for a period longer than that to which his own interest extends, he does not thereby give to his tenant an interest available against the reversioner or remainder man. The subtenant's interest will expire with the interest of the person who created it. But as between the subtenant and his immediate lessor the tenancy will be good, and, should the interest of that lessor become greater than it was when the subtenancy was created, the subtenant will have the benefit of it. In the same way, as between lessor and lessee—landlord and tenant—the latter has no right to look beyond the grant of the former so as to call in question his title. Be that title what it may, the tenant, by accepting that position, is *estopped* from denying that it is good. It may be notoriously bad, but that is nothing to him. The landlord is not obliged to prove his title as against the tenant or any person claiming through his tenant. In an action of ejectment (for the recovery of land) the person claiming possession must in general prove his own title—mere possession being a *prima facie* sufficient defence, until a better title be shown. But a landlord seeking to secure possession of land from his tenant is not obliged to prove anything, except his right to resume possession under the agreement. The tenant, however, may, without disputing the validity of the title under which he entered, show that it has since been determined by lapse of time or by operation of law.

A large portion of the land of the country being held under settlements whereby the person in possession for the time being had only the legal interest of a tenant for life, there were until recently great difficulties in the way of letting such land advantageously. The Leases and Sales of Settled Estates Act, 1856, now empowers any person entitled to the rents and profits of a settled estate to demise the same by deed for any term not exceeding twenty-one years to take effect in possession and at the best rent obtainable. Settlements containing express directions to the contrary will, however, avoid the statute; and on the other hand a settlement may contain powers to the tenant for life to grant leases for even longer terms.

The legal rights and duties of landlord and tenant respectively are in most cases defined by the contract of tenancy. The policy of the law has hitherto been to allow the landlord, who is virtually if not technically absolute owner of the land, to do as he pleases with it. The contract of tenancy has hitherto been a free contract, and, although in the absence of contract the law itself defines

the rights of the parties, there is hardly one of these which may not be displaced or modified by the agreement. This, it may be said in passing, is the seat of the very widespread dissatisfaction that exists in all the three kingdoms with what are vaguely termed the land laws. A small class has been allowed to acquire absolute dominion over the land of the country, and may impose what terms it pleases on the rest of the community for the right to use the land. The law governing the devolution of land is intricate and perplexing no doubt, and by making conveyances expensive hinders the free distribution of the land among a larger class of owners. But that is not the real root of the present discontent. Its real root is the absolute dominion of the class of owners who are not cultivators, but who, having the monopoly of the land, may load the cultivators with what burdens they please. As for the law of landlord and tenant, it is still greater misconception to suppose that to be in fault. It is what the landlord or tenant chooses to make it. There is very little of it, independently of contract, and what little there is may be altered as the parties please. No law can be better than one which allows men to make their own contracts and limits itself to enforcing them. That is what the law of landlord and tenant does. If its effects are bad, it must be because the original conditions of the contracting parties are other than they ought to be. We shall have to show that practical evils have led to a demand for an alteration on the law of landlord and tenant in the direction of limiting the power of the landlord to impose terms on the tenant.

One privilege imposed by the law on this landlord must be excepted from what has just been said. The right to distrain for rent is a special interference of the law for the protection of the landlord. Besides suing for his rent as a man may for any other right, besides taking advantage of whatever covenants he may have made for entry on default of payment, a landlord may enter upon the demise premises and help himself to whatever articles of personal property he may find there, to an amount sufficient to satisfy his claim. Distress as a general rule extends to all movable property found on the premises, whether belonging to the tenant or not; but there are certain well-defined exemptions, as, for example, goods sent to a man publicly carrying on a trade to be worked at or dealt with in the way of his trade. And some things have the benefit of a conditional exemption, as horses employed to work the ground, which should not be taken so long as there is any other property to satisfy the distress. This privilege is an injurious interference with the property and rights of third persons. It exposes persons dealing with the tenant to the danger of losing whatever property of their own they may permit to be on his premises, and of having their claims against him postponed to those of the landlord. This is a wide departure from the general principle of the law, which is to leave the parties alone; but even here the right to distress may be expressly abolished in the contract of tenancy if the parties please.

Again, this land, on the expiration of the tenancy, becomes the absolute property of the landlord, no matter how it may have been altered or improved during the occupation. In certain cases the law has discriminated between the contending claims of landlord and tenant. (1) In respect of *fixtures* (which may be shortly defined as movables so affixed to the soil as to become part thereof), the tenant may sometimes remove them, e.g., when they have been brought on the premises for the purpose of being used in business. This, it is said, is done by way of encouraging trade, but it is curious that no similar principle has been admitted for the encouragement of agriculture. (2) In respect of *emblements*, i.e., the profits of sown land, a tenant may be entitled to these whose term

comes to an end by the happening of an uncertain contingency. (3) A similar right is very generally recognized by custom in tenants whose term expires in the ordinary way. The custom of the district, in the absence of stipulations between the parties, would be imported into their contract—the tenant going out on the same conditions as he came in. But with these exceptions the land in its improved condition passes over to the landlord. The tenant may have added to its value by buildings, by labour applied to the land, or by the use of fertilizing manures, but, whatever be the amount of the additional value, he is not entitled to any compensation whatever. This again is a matter which the parties may, if they please, regulate for themselves. As a matter of fact, landlords never allow a compensation clause to be inserted in their leases.

The Agricultural Holdings Act, 1875, attempts to remedy this injustice by enacting that compensation shall be paid to tenants for improvements the benefit of which has not been exhausted at the end of the lease. These are of three classes:—(1) Drainage of land, erection or enlargement of buildings, laying down permanent pastures, making and planting osier beds, making water meadows or works of irrigation, making gardens, roads, or bridges, water-courses, ponds, wells, or reservoirs, making fences, planting hedges, planting orchards, reclaiming waste lands, and warping land. The tenant to establish a claim for compensation must have the landlord's consent in writing to the improvements. The compensation is a sum equal to the amount originally expended, less one-twentieth for every year that has elapsed since, and the whole benefit of the improvement is taken to be exhausted in twenty years. (2) Boning lands with undissolved bones, chalking land, clay bonring, claying, liming, and marling land, after notice in writing given to the landlord. They are deemed to be exhausted at the end of seven years, and the compensation is the sum expended, less one seventh for every year. (3) Artificial or other purchased manure applied to the land, and cake or other feeding stuff consumed thereon by cattle, &c. Exhausted in two years, compensation to be a sum representing its fair value to an incoming tenant. The Act, however, has no application if the parties agree in writing, either on the contract of tenancy or otherwise, that it shall not apply. In point of fact, landlords insist upon the renunciation of the Act as a condition of granting a lease. The Act has accordingly become a dead letter.

The mutual rights of the parties are, as we have already said, regulated to a large extent by special provisions or covenants in the lease. The most usual of these are the following:—(1) The landlord covenants that the tenant shall have quiet enjoyment of the premises for the time agreed upon, and in the absence of such a proviso a covenant to this effect will be implied from the fact of letting. The obligation makes the landlord responsible for any lawful eviction of the tenant during the term, but not for wrongful eviction unless he is himself the wrongdoer, or has expressly made himself responsible for evictions of all kinds. (2) The tenant is presumed to undertake to use the property in a reasonable manner according to the purposes for which it was let, and to do reasonable repairs. The landlord is not presumed to have undertaken to put the premises in repair, nor to execute repairs. But the respective obligations of parties where repairs are, as they always are in leases for years, the subject of express covenant may vary indefinitely. The obligation is generally imposed on the tenant to keep the premises in "good condition" or "tenant-like repair," and it will be construed with reference to the character of the premises demised, their age, and their condition. A covenant to repair, unless limited specially, makes the tenant liable to rebuild houses destroyed by accident. A covenant to keep in repair

requires the tenant to put the premises in repair if they are out of repair, and to maintain them in that condition up to and at the end of the tenancy. A breach of the covenant gives the landlord an action for damages, which will be measured by estimated injury to the reversion if the action be brought during the tenancy, and by the sum necessary to execute the repairs if the action be brought later. (3) The improper use of the premises to the injury of the reversioner is waste. *Voluntary waste* is when the tenant by some positive act of his own has injured the premises; *permissive waste* is when the injury is caused by some omission. Tenants-at-will or from year to year are not liable for the latter. What is or is not waste is in some instances dependent on the custom of the country, but in general anything which damages the freehold or alters its nature is waste. Even the erection of new buildings would, strictly speaking, be waste unless the lease could be construed as authorizing them. Besides these general conditions implied in law, the use of the premises may be restricted indefinitely by special provisos. Covenants against using the premises for the carrying on of particular trades or businesses are the most usual. In this category may be placed the rules as to cultivation to be found in agricultural leases, in which also an obligation to cultivate in conformity with the custom of the district would be implied. (4) Covenants by the tenant to insure and keep insured the premises are also common, and if the premises are left uninsured for the smallest portion of the term, although there may be no damage by fire, the covenant is broken. (5) The rates and taxes are generally the subject of special covenants. One tax, the property tax, is specially excepted. It must be paid by the landlord, and if the tenant should pay it the landlord must deduct it from the rent. The parties cannot by contract make any different arrangement. Another charge on lands—the rent-charge fixed under the Tithes Commutation Acts in lieu of tithes—is not a personal charge against either landlord or tenant, but is leviable by distress. Apart from agreement, the charge, if paid by the tenant, may be deducted from the rent. Other rates and charges, whether primarily imposed on landlord or tenant, may be imposed by the contract upon one or other as the parties may agree. (6) The incidents of rent—its amount, whether fixed or fluctuating, its nature, whether in money or otherwise, time and mode of payment, &c.—are fixed by the agreement of the parties. When the land has been occupied without a letting, the owner has an action against the occupier for compensation for use and occupation, an undertaking to pay being implied from the fact of occupation. But in other cases the rent due is a matter of agreement between the parties, the law interpreting the terms when necessary. Thus an agreement to pay a rent of £100, no times of payment being mentioned, would be construed as an agreement to pay that rent annually. Rent is said to be *due* at the first moment of the day appointed for payment, and in arrear at the first moment of the day following. It has already been said that, in addition to the right of action as for an ordinary debt, the landlord has a special right of distress. The covenant may also give him the right to enter and eject the tenant on non-payment.

Covenants are said to "run with the land" when the liabilities and rights created by them pass to the assignees of the original parties. At common law it was said that covenants "ran with the land" but not with the reversion, the assignee of the reversioner not having the rights of the original lessor. But the assignees of both parties have been on the same footing since the statute 32 Henry VIII. c. 84. The following covenants "run with the land":—(1), all implied covenants; (2) all express covenants concerning something in being at the time of the covenant

and "parcel of the demise", (3) covenants relating to things not in being but to be built or done on the premises, and the covenant be for the covenantor himself and "his assigns." But things merely collateral do not bind the assigns even if they be named.

The right of the tenant to assign his lease—as well as his right to make an underlease—may itself be restricted by agreement, and covenants to that effect are not uncommon. Sometimes the tenant covenants not to assign or underlet without consent, and it may be provided that such consent will not be refused except on reasonable grounds. The lessee is not discharged from liability by the assignment unless the landlord accepts the assignee as his tenant, and even then the original lessor will remain liable on his own express covenants.

The tenant may be forfeited either for breach of some condition on which his lease was granted, or in virtue of a specific provision for re-entry on breach of any covenant. Such a proviso is generally attached to the covenants, and the effect of a breach of a covenant so protected is to make the lease voidable at the option of the landlord. The tenant cannot take advantage of his own default to terminate the tenancy. The landlord must signify his intention to avoid the lease by some specific act. If he accepts rent, or, it seems, if he even asks for it after notice of an act of forfeiture, he waives any breach of covenant up to that time, but not forfeiture for future or continuing breaches. The condition of forfeiture on breach may be attached to any covenants the parties choose to make, and may therefore in many cases press hardly on the tenant, who for a trifling default may lose the whole value of his term. The courts in some few instances will relieve a tenant from forfeiture. Thus they may relieve once against a forfeiture for breach of covenant to insure, when no damage has occurred and an insurance is in effect at the time of application. Relief will also be given for forfeiture by non-payment of rent, if the arrears be paid up. And on the ground of fraud, accident, or mistake forfeitures may be relieved against in other cases. The determination of a lease by forfeiture has the same effect as its determination in any other way, in destroying substantialities or other rights created under it.

It will be seen that with a few insignificant exceptions the contract is left by law to be regulated by the parties. In one particular an important change has been made by a recent Act. The right to the game, as we have already pointed out, can only be taken out of the tenant by an express grant made by him. The Ground Game Act, 1880, enacts that "any occupier of land shall have as incident to and inseparable from his occupation of the land the right to kill and take ground game thereon, concurrently with any other person who may be entitled to kill and take ground game on the same land,"—subject to certain conditions which need not be recited here. And "every agreement, condition, or arrangement which purports to divest or alienate the right of the occupier, so declared, given, and reserved to him by this Act, or which gives to such occupier any advantage in consideration of his forbearing to exercise such right, or imposes upon him any disadvantage in consequence of his exercising such right, shall be void." Another clause provides that, when the right to kill and take ground game is at the passing of the Act vested in any person other than the occupier, under a *bona fide* contract, the occupier's rights under the Act shall not come into existence until the determination of that contract. "Ground game" means "hares and rabbits."

Scotland.—In Scotch law, the contract of location is consensual and in its own nature merely personal; but by statute it is made real against singular successors* (*i.e.*, purchasers). A lease for any greater term than one year must be in writing. The lessor and his representatives are bound by a written lease which is "authentic

in terms of the statutes and delivered, or fortified by a *res interdicta*," or sanctioned by homologation,¹ or is an offer, followed by real evidence of acceptance, or written articles or conditions proved by written evidence to have been adopted by the parties, or even a written obligation to grant a lease. The singular successors of the lessor will be bound where he is bound, provided (1) that the lease is definite as to subject, rent, and term of duration, and (2) that possession shall have followed as a badge of real right under the statute (1449, c. 17). Thus, while a lease of any duration will be good against the lessor and his heirs, as against singular successors it must in general have a definite term of duration, unless it be specially warranted and homologated. The usual term in agricultural leases is nineteen years, and longer terms are common for building and mining leases, but there appears to be some uncertainty as to whether any and what limit must be imposed on the length of a term. So, as to rent, it may be as against the grantor a merely nominal sum, or may be retained by the lessee for debt; but as against singular successors it must stand payable. Rent, it is said, may be either in money, grain, or service, but it must not be illusory. Rent in money is generally payable at the "legal terms" Whitsunday and Martinmas. The obligation to pay rent is extinguished by the destruction of the subject, and this principle appears to have been applied to the partial destruction of the subject occasioned by the disastrous failure of a particular season. "When the destruction is partial, the point is more doubtful, and the distinction seems to be that, if it be permanent though partial, the failure of the subject lot will give relief by entitling the tenant to rescind the lease unless a deduction be allowed, but that, if it be merely temporary and occasional, it will not suffice to entitle the tenant to relief. In the decisions, however, relief has been given to a greater extent than that distinction would authorize; thus devastation of the crop by storms, &c., *et plus quam tolerabile*, has been admitted as a ground of abatement; but as the tenant takes the risk of the season it must at least be some extraordinary event that will justify such a demand" (Bell's *Principles*). And it would appear that the tenant has no relief against such partial destruction of the subject lot as may be occasioned by a subsequent law, as for example in the case of a fishing lease, by an Act extending the close time. Rent may be recovered either by process of debt or by the equivalent of distress, *viz.*, by *hypothec* (see *HYPOTHEC* in the Scotch law there is not, as in English, a *prima facie* right in the tenant to assign the lease or sublet the premises. On the principle of *delectus personarum*, the landlord is presumed to have excluded all save those whom he has expressly admitted, at least in ordinary cases, though a different rule prevails in longer leases. The heirs of tenants were at one time excluded, but they now succeed to the lease. The obligations of the parties as to mode of cultivation, amount of rent, length of term, repair, and so on are for the most part regulated as in England by the express provisions of the lease. The tenant is bound to give up the premises at the expiration of the term without compensation for any permanent or unexhausted improvement thereon. "It is implied," says Bell, "in the contract of lease that any buildings, fences, or improvements which the tenant may spontaneously make are made in contemplation of his own interest and for his own use only. And so he has no claim for such meliorations at the end of his lease without special stipulation. But, if the tenant's possession be terminated abruptly and prematurely, he ought in equity to be entitled to recompense."

Ireland.—The law of landlord and tenant has been until recently substantially the same as that which has already been described for England, and it will only be necessary to notice here the more important changes that have been made in Ireland by legislation. It may be pointed out, without touching at all on the vexed Irish land question, that the uncongeniality of the situation in which a limited class own the soil, and let it out on hire on what terms they please to cultivators, has been felt with particular force in Ireland. Agriculture is the one industry of the country, and that industry was carried on under conditions which made it all but impossible. The Irish tenant was, equally with the English tenant, at the mercy of his landlord. If he made improvements he did so at the risk of losing them by eviction or by being taxed for them by an increased rent. The insecurity of his tenure gave him the alternative of doing nothing to better his farm or bettering his farm without bettering himself. At the same time there existed in Ireland, in consequence of circumstances peculiar to the people, an excessive competition for land such as has never been witnessed in England. The natural outcome of this condition of things was a demand for some change in the law which could give tenants a reasonable security for their industry. And the way was paved for such changes by the existence in Ulster of a local custom having virtually the force of law, which did provide such a security. This was a custom of which the tenant was to take notice, and any landlord who chose to do so might insist upon

¹ This is inferred from the fact that the grantor has knowingly permitted sales "not unimportant to be done by the lessor on the faith of the contract."

ignoring it in his dealings with his tenants. Nor was the custom in itself everywhere clear or uniform. "It is a strange thing to say," says Mr Butt, "but it would be impossible to frame any statement as to the nature and meaning of the custom which would be universally accepted as a correct description of the character." The Ulster custom had, however, two main features—fixity of tenure, and free right of sale by the tenant of his interest. "So long as the tenant pays his rent the landlord will not use his legal powers to put an end to the tenancy," says Judge Longfield, describing the system, and the same authority adds that "the sale by an outgoing tenant of his tenant right is to be with the approbation of the landlord." This approbation is not to be capriciously refused, but on the other hand the tenant is not at liberty to select any substitute that he thinks proper irrespective of his character and possession of sufficient means for the efficient cultivation of the land.¹ The strength of the custom may be estimated from a statement made by one of the witnesses before the Devon commission:—"If systematic attempts were made amongst the proprietors of Ulster to invade tenant right, I do not believe Ulster is a force at the disposal of the Home Guard sufficient to keep the peace of the province." And Mr Butt estimates that the sum which tenants under the Ulster custom would receive on the sale of their tenant right would amount to more than £200,000,000.

The Landlord and Tenant (Ireland) Act, 1870, enacts, section 1, that "the usages prevalent in the province of Ulster (in this Act intended to be included under the denomination of the Ulster tenant right custom) are hereby declared to be legal, and shall in the case of any holding in the province of Ulster proved to be subject thereto be enforced in the manner provided by this Act." By section 2 like usages elsewhere than in Ulster are in like manner legalized. And a tenant who is not entitled to compensation under sections 1 and 2 is nevertheless declared to be entitled to the following rights—(1) if holding under a tenancy created after the passing of the Act he is disturbed in his holding by the landlord, he shall be entitled to compensation for the loss which the court shall find to have been incurred by him, subject to a scale of maximum amounts varying from seven years' rent on holdings of the annual value of £10 and under to one year's rent on holdings of the value of £100 and over, and in no case exceeding £250; and (2) he may, on quitting his holding, claim compensation in respect of improvements made by himself or his predecessors in title, subject to certain considerable exceptions, as regards tenancies and improvements. The second part of the Act contains provisions to facilitate the purchase of the tenant's free simple of their holdings, and the third part enlarges the commissions of public works in Ireland to advance moneys both to landlords for payment of compensation for improvements and to tenants for the purchase of their holdings. Section 44 enacts that the board, if they are satisfied with the security, may advance to any tenant for the purchase of his holding, in pursuance of the Act, any sum not exceeding two-thirds of the price of such holding, and upon an order being made by the board such holding shall be deemed to be charged with an annuity of five pounds for every one hundred pounds of such advance, and so in proportion for any less sum, such annuity to be limited in favour of the board, and to be declared to be repayable in the term of thirty-five years. Section 46 requires the Landed Estates Court on the sale of estates to afford as far as may be consistent with the interests of the persons concerned facilities for such purchases by tenants, whether by selling the estate in suitable lots or otherwise. The principle of transferring the occupying tenants into peasant proprietors which these clauses are intended to carry out is associated with the name of Mr Bright. The Bright clauses have not had the practical success that was hoped for,—a result which is attributed to the unfitness of the Landed Estates Court for working them. And it may be added that the Act of 1870 failed to diminish the value of the Irish people, reackrenting and eviction being still possible, and the process for obtaining compensation being tedious and expensive.

The Land Law (Ireland) Act, 1881, was accordingly passed. Section 1 provides that the tenant for the time being of every holding not specially excepted to shall have his tenancy for the term that can be obtained, subject to certain conditions and provisions specified in sixteen subsections. A tenant from year to year is not permitted to subdivide or sublet his holding without permission of the landlord. A person to whom a tenant has bequeathed the tenancy is in the same position as a purchaser after sale. When a landlord demands an increase of rent from a present or future tenant, then (1), if the tenant submits, his tenancy shall become a statutory tenancy, subject to statutory conditions for the period of fifteen years; (2) a future tenant not accepting increase but selling shall be entitled to receive such amount as a court may fix for depreciation of the selling value by the increased rent; (3) a tenant, not accepting but not

selling, is entitled to compensation as for disturbance; (4) and a present tenant may apply to the court to have a rent fixed. A tenant during a statutory term shall not be compelled to pay a higher rent than the rent payable at the commencement, and shall not be compelled to quit except on breach of the statutory conditions, some of which are as follows:—the tenant must pay rent at the appointed time, must not commit persistent waste, must not subdivide or sublet or erect a dwelling-house otherwise than is provided in the Act. Agistment, or letting for pasture, and letting on consacre for growing potatoes or other green crop are not within this provision. The landlord retains the right to enter for the purpose of taking minerals, stone, timber, making roads, having, shooting, fishing, and so on. The tenant may not open a public house without the landlord's consent. The section is not to prejudice any objection for non-payment of rent in respect of rent accrued due for a holding before the commencement of the statutory term.

Sections 6 and 7 amend the law as to compensation for disturbance and compensation for improvements as contained in the Act of 1870. Section 8 authorizes the court (to be created by the Act) to fix a fair rent on the application of either party, and such judicial rent shall be the rent of the tenancy for the statutory term of fifteen years as above specified. The court is to determine what is a fair rent after hearing parties, having due regard to their respective interests and to the circumstances of the case, holding, and district. A new statutory term shall not begin until the expiration of a preceding one, and an alteration of judicial rent shall not take place at less intervals than fifteen years. Two important subsections deserve to be specially noticed. It is provided (subsection 2) that the court may disallow the tenant's application if it is satisfied that "the permanent improvements" on the holding, which if executed by the tenant would have entitled him to compensation under the Acts of 1870 and 1881, have been made and maintained by the landlord and his predecessors in title and not made or acquired by the tenant or his predecessors. On the other hand, no rent shall be allowed or made payable in respect of improvements made by the tenant or his predecessors in title for which, in the opinion of the court, they shall not have been paid by the landlord or his predecessors. When application is made to the court for a judicial rent on a holding not subject to the Ulster tenant right or other analogous custom, the parties by agreement or the court may fix a value on the tenancy, and, if during the term the tenant should give notice to the landlord of his intention to sell, the landlord shall purchase the tenancy at the value so fixed, subject to addition for subsequent improvements and deductions for outgoings. Subsection 10 provides that "the amount of money or money's worth that may have been paid or given for the tenancy of any holding by a tenant or his predecessors in title, otherwise than to the landlord or his predecessors in title, shall not of itself, apart from other considerations, be a ground for reducing or increasing the rent of such holding."

The Act may be excluded by agreement as follows. The landlord and tenant may agree to a "judicial lease" for thirty-one years and upwards, which if approved by the court will take effect, and the holding will be regulated by the lease and not be deemed subject to the Act. The parties may agree to a "fixed tenancy," which shall not be deemed subject to the Act, which shall be held upon such conditions as parties may agree upon, and with reference to which the court shall consider the interest of persons entitled to an estate or interest in the land, present limited owners. In such a case the tenant shall pay a fixed rent, which may or may not be subject to revaluation by the court, and shall not be compelled to quit his holding except on breach of some of the conditions previously declared to be statutory.

These are the main provisions of the Act, establishing more or less completely what are known as the three "fair rents," "fixed tenures," and "free sale." Miscellaneous provisions supplementary to these can only be briefly noticed. Section 20 enacts that the "tenancies to which the Act applies shall be deemed to have determined whenever the landlord has resumed possession of the holding either on the occasion of a purchase by him of the tenancy or on the death of the tenant in selling or by operation of law or otherwise." But a tenant holding under an Ulster or other analogous custom shall be entitled to the benefit of such custom, notwithstanding the determination of his tenancy by breach of a statutory condition. Section 21 deals with existing leases, which are to remain in force, but at the expiration of such leases the tenants shall be deemed to be tenants under the ordinary tenancies from year to year, and therefore subject to the Act. Section 22 allows a tenant whose holding is of the annual value of £150 to contract himself out of this or the previous Act, and there is a special clause dealing with the case in which a landlord has before the Act purchased the Ulster tenant right, but otherwise any provision contained in any lease or contract of tenancy inconsistent with the provisions of this Act shall be void. Part 5 relates to the acquiescence of the tenant.

¹ The right of alienation for non-payment of rent was conferred on landlords by previous legislation. It is unknown to English law, where a tenant only gives a right of re-entry if protected by a special proviso to that effect in the lease.

¹ *Practical Treatise on the Law of Compensation to Tenants in Ireland*, by James Butt, Q. C., Dublin, 1871.

² An excellent account of the origin and results of the Ulster custom is given in *The Irish Land Question from 1580 to 1880*, by T. Barry O'Brien, London, 1880.

tion of land by tenants, reclamation of land, and emigration. Part 6 describes the forms of proceedings to be taken under the Act. In addition to the civil bill court of the county which has "jurisdiction in respect of all disputes arising between landlord and tenant under the Act," a special land commission has been constituted, in which proceedings may be commenced or to which if commenced in the civil bill court they may be transferred. Three commissioners are named in the Act, and an indefinite number of assistant commissioners is authorized. The land commission is vested with the general powers of the Act, but it is directed to grant an appeal to the court of appeal, in proper cases, not including decisions as to fair rent or other matters left to the discretion of the commissioners. (R. R.)

LONDON, CHARLES PAUL (1760-1826), French painter and art-author, was born at Nonant in 1760, entered the studio of Regnault, and carried off the first prize of the Academy in 1793. After his return from Italy, disturbed by the Revolution, he seems to have abandoned painting for letters, but he began to exhibit in 1795, and continued to do so at various intervals up to 1814. His *Leda* obtained an award of merit in 1801, and is now in the Louvre. His *Mother's Lesson*, *Paul and Virginia Bathing*, and *Dædalus and Icarus* have been engraved; but his works on painting and painters, which reach nearly one hundred volumes, now form his chief title to be remembered. In spite of a complete want of critical accuracy, an extreme carelessness in the biographical details, and the feebleness of the line engravings by which they are illustrated, London's *Annales du Musée*, in 33 vols., form a vast repertory of compositions by masters of every age and school, which will always have value for the writer on art. Besides this work and many others of less importance, London published *Lives of Celebrated Painters*, in 22 vols.; *An Historical Description of Paris*, 2 vols.; *A Description of London*, with 42 plates; and descriptions of the Luxembourg, of the Gustavian collection, and of the gallery of the Duchesse de Berry. He died at Paris in 1826.

LONDON, LUCETTA ELIZABETH (1803-1838), a writer of poetry and fiction, better known by her initials L. E. L. than as Miss London or Mrs Maclean, was descended from an old Herefordshire family, and was born at Chelsea, 14th August, 1803. Her father, an army agent, succeeded in amassing a large property, which he lost by speculation shortly before his death. By this time the daughter by her contributions to the *Literary Gazette* and to various Christmas annuals, as well as by some volumes of verse, had acquired a wide literary fame. Probably her position in society contributed to the interest they awakened, but the gentle melancholy and romantic sentiment her writings embodied would in any case have secured her the sympathy and approval of a wide class of readers. Though deficient in condensation and finish, they occasionally display a richness of fancy and an aptness of language which might have ripened, by more sedulous culture, into true poetical worth. In June 1838 she married George Maclean, governor of Cape Coast Castle, but she only survived her marriage a few months, dying from an overdose of prussic acid, which, it is supposed, was taken accidentally.

For some time L. E. L. was joint editor of the *Literary Gazette*. Her first volume of poetry appeared in 1820 under the title *The Fate of Adeline*, and was followed by other collections of verses with similar titles. She also wrote several novels. Various editions of her *Poetical Works* have been published since her death, the last being that with an introductory memoir by W. B. Scott, 1880. *The Life and Literary Remains of Letitia Elizabeth London*, by Leman Blanchard, appeared in 1841, and a second edition in 1866.

LONDON, WALTER SAVAGE (1775-1864), born at Warwick, January 30, 1775, died at Florence, September 17, 1864. In the course of this long life he had won for himself such a double crown of glory in verse and in prose as has been won by no other Englishman but Milton. And with that special object of his lifelong veneration he

had likewise in common other claims upon our reverence to which no third competitor among English poets can equally pretend. He had the same constancy to the same principles, the same devotion to the same ideal of civic and heroic life, the same love, the same loyalty, the same wrath, scorn, and hatred, for the same several objects respectively; the same affection and kinship to the spirit of the Romans, the same natural enjoyment and mastery of their tongue. Not accident merely but attraction must in any case have drawn them to enlist in the ranks and serve under the standard of the ancient Latin army of patriots and poets. But to Landon more than to Milton the service of the Roman Muse was a natural and necessary expression of his genius, a spontaneous and just direction of its full and exuberant forces. At the age of twenty he published an eloquent and elegant vindication of her claims upon the service and devotion of modern writers,—the first sketch or suggestion of a longer essay, to be published in its final form just fifty-two years later. In 1795 appeared in a small volume, divided into three books, *The Poems of Walter Savage Landon*, and, in pamphlet form of nineteen pages, an anonymous *Moral Epistle, respectfully dedicated to Earl Stanhope*. No poet at the age of twenty ever had more vigour of style and fluency of verse; nor perhaps has any ever shown such masterly command of epigram and satire, made vivid and vital by the purest enthusiasm and most generous indignation. Three years later appeared the first edition of the first great work which was to inscribe his name for ever among the great names in English poetry. The second edition of *Geor* appeared in 1803, with a text corrected of grave errors and improved by magnificent additions. About the same time the whole poem was also published in a Latin form, which for might and melody of line, for power and perfection of language, must always dispute the palm of precedence with the English version. In 1808, under an impulse not less heroic than that which was afterwards to lead Byron to a glorious death in redemption of Greece and his own good fame, Landon, then aged thirty-three, left England for Spain as a volunteer to serve in the national army against Napoleon at the head of a regiment raised and supported at his sole expense. After some three months' campaigning came the affair of Cintra and its disasters; "his troop," in the words of his biographer, "dispersed or melted away, and he came back to England in as great a hurry as he had left it," but bringing with him the honourable recollection of a brave design unselfishly attempted, and the material in his memory for the sublimest poem published in our language between the last masterpiece of Milton and the first masterpieces of Shelley—one equally worthy to stand unchallenged beside either for poetic perfection as well as moral majesty—the lofty tragedy of *Count Julian*, which appeared in 1812, without the name of its author. No comparable work is to be found in English poetry between the date of *Samson Agonistes* and the date of *Prometheus Unbound*; and with both these great works it has some points of greatness in common. The superhuman isolation of agony and endurance which encircles and exalts the hero is in each case expressed with equally appropriate magnificence of effect. The style of *Count Julian*, if somewhat deficient in dramatic ease and the fluency of natural dialogue, has such might and purity and majesty of speech as elsewhere we find only in Milton so long and so steadily sustained.

In May 1811 Landon had suddenly married Miss Julia Thuillier, with whose looks he had fallen in love at first sight in a ball-room at Bath; and in June they settled for awhile at Llanthony Abbey in Wales, from whence he was worried in three years' time by the combined vexation of neighbours and tenants, lawyers and lords-tenantant; not

before much toil and money had been nobly wasted on attempts to improve the sterility of the land, to relieve the wretchedness and raise the condition of the peasantry. He left England for France at first, but after a brief residence at Tours took up his abode for three years at Como, "and three more wandering years he passed," says his biographer, "between Pisa and Pistoia, before he pitched his tent in Florence in 1821." In 1824 appeared the first series of his *Imaginary Conversations*, in 1826 "the second edition, corrected and enlarged"; a supplementary third volume was added in 1828; and in 1829 the second series was given to the world. Not until 1846 was a fresh instalment added, in the second volume of his collected and selected works. During the interval he had published his three other most famous and greatest books in prose. *The Citation and Examination of William Shakespeare*, 1834; *Pericles and Aspinu*, 1836; *The Pentameron*, 1837. To the last of these was originally appended *The Pentatopia*, containing five of the very finest among his shorter studies in dramatic poetry. In 1847 he published his most important Latin work, *Poemata et Inscriptiones*, comprising, with large additions, the main contents of two former volumes of idyllic, satiric, elegiac, and lyric verse, and in the same golden year of his poetic life appeared the very crown and flower of its manifold labours, *The Hellenics of Walter Savage Landor*, enlarged and completed. Twelve years later this book was reissued, with additions of more or less value, with alterations generally to be regretted, and with omissions invariably to be deplored. In 1853 he put forth *The Last Fruit of an Old Tree*, containing fresh conversations, critical and controversial essays, miscellaneous epigrams, lyrics, and occasional poems of various kind and merit, closing with *Five Scenes* on the martyrdom of Beatrice Cenci, unsurpassed even by their author himself for noble and heroic pathos, for subtle and genial, tragic and profound, ardent and compassionate insight into character, with consummate mastery of dramatic and spiritual truth. In 1856 he published *Antony and Octavius—Scenes for the Study*, twelve consecutive poems in dialogue which alone would suffice to place him high among the few great masters of historic drama. In 1858 appeared a metrical miscellany bearing the title of *Dry Sticks Fagoted by W. S. Landor*, and containing among other things graver and lighter certain epigrammatic and satirical attacks which involved him in the troubles of an action for libel; and in July of the same year he returned for the last six years of his life to Italy, which he had left for England in 1835. Embittered and distracted by domestic dissensions, if brightened and relieved by the affection and veneration of friends and strangers, this final period of his troubled and splendid career came at last to a quiet end on the 17th of September 1864. In the preceding year he had published a last volume of *Heroic Idylls*, with additional poems, English and Latin,—the better part of them well worthy to be indeed the "last fruit" of a genius which after a life of eighty-eight years had lost nothing of its majestic and pathetic power, its exquisite and exalted loveliness.

A complete list of Landor's writings, published or privately printed, in English, Latin, and Italian, including pamphlets, fly-sheets, and occasional newspaper correspondence on political or literary questions, it would be difficult to give anywhere and impossible to give here. From nineteen almost to ninety his intellectual and literary activity was indefatigably incessant, but, herein at least like Charles Lamb, whose cordial admiration he so cordially returned, he could not write a note of three lines which did not bear the mark of his "Roman hand" in its matchless and inimitable command of a style at once the most powerful and the purest of his age. The one charge which

can ever seriously be brought and maintained against it is that of such occasional obscurity or difficulty as may arise from excessive strictness in condensation of phrase and expurgation of matter not always superfluous, and sometimes almost indispensable. His English prose and his Latin verse are perhaps more frequently and more gravely liable to this charge than either his English verse or his Latin prose. At times it is well nigh impossible for an eye less keen and swift, a scholarship less exquisite and ready than his own, to catch the precise diction and follow the perfect course of his rapid thought and radiant utterance. This apparently studious pursuit and preference of the most terse and elliptic expression which could be found for anything he might have to say could not but occasionally make even so sovereign a master of two great languages appear "dark with excess of light", but from no former master of either tongue in prose or verse was ever the quality of real obscurity, of loose and nebulous uncertainty, more utterly alien or more naturally remote. There is nothing of cloud or fog about the path on which he leads us; but we feel now and then the want of a bridge or a handrail; we have to leap from point to point of narrative or argument without the usual help of a connecting plank. Even in his dramatic works, where least of all it should have been found, this lack of visible connexion or sequence in details of thought or action is too often a source of sensible perplexity. In his noble trilogy on the history of Giovanna queen of Naples it is sometimes actually difficult to realize on a first reading what has happened or is happening, or how, or why, or by what agency,—a defect alone sufficient, but unhappily sufficient in itself, to explain the too general ignorance of a work so rich in subtle and noble treatment of character, so sure and strong in its grasp and rendering of "high actions and high passions," so rich in humour and in pathos, so royally serene in its commanding power upon the tragic mainstays of terror and of pity. As a poet, he may be said on the whole to stand midway between Byron and Shelley,—about as far above the former as below the latter. If we except Catullus and Simonides, it might be hard to match and it would be impossible to overmatch the flawless and blameless yet living and breathing beauty of his most perfect elegies, epigrams, or epitaphs. As truly as prettily was he likened by Leigh Hunt "to a stormy mountain pine which should produce lilies." His passionate compassion, his bitter and burning pity for all wrongs endured in all the world, found only their natural and inevitable outlet in his lifelong defence or advocacy of tyrannicide as the last resource of baffled justice, the last discharge of heroic duty. His tender and ardent love of children, of animals, and of flowers, makes fragrant alike the pages of his writing and the records of his life. He was as surely the most gentle and generous as the most headstrong and hot-headed of heroes or of men. Nor ever was any man's best work more thoroughly imbued and informed with evidence of his noblest qualities. His loyalty and liberality of heart were as inexhaustible as his bounty and beneficence of hand. Praise and encouragement, deserved or undeserved, came yet more readily to his lips than challenge or defiance. Reviled and ridiculed by Lord Byron, he retorted on the offender living less readily and less warmly than he lamented and extolled him dead. On the noble dramatic works of his brother Robert he lavished a magnificence of sympathetic praise which his utmost self-estimate would never have exacted for his own. Age and the lapses of time could neither heighten nor lessen the fulness of this rich and ready generosity. To the poets of his own and of the next generation he was not readier to do honour than to those of a later growth, and not seldom of deserts far lower and far lesser claims than theirs. That he was not

unconscious of his own, and avowed it with the frank simplicity of nobler times, is not more evident or more certain than that in comparison with his friends and fellows he was liable rather to undervalue than to overrate himself. He was a classic, and no formalist, the wide range of his just and loyal admiration had room for a genius so far from classical as Blake's. Nor in his own highest mood or method of creative as of critical work was he a classic only, in any narrow or exclusive sense of the term. On either side, immediately or hardly below his mighty masterpieces of *Peaces and Aspasia*, stand the two scarcely less beautiful and vivid studies of mediæval Italy and Shakespearean England. The very finest flower of his immortal dialogues is probably to be found in the single volume comprising only "Imaginary Conversations of Greeks and Romans", his utmost command of passion and pathos may be tested by its transcendent success in the distilled and concentrated tragedy of *Teberius and Vipsania*, where for once he shows a quality more proper to romantic than classical imagination,—the subtle and sublime and terrible power to enter the dark vestibule of distraction, to throw the whole force of his fancy, the whole fire of his spirit, into the "shadowing passion" (as Shakespeare calls it) of gradually mounting insanity. Yet, if this and all other studies from ancient history or legend could be subtracted from the volume of his work, enough would be left wherewith to rest the foundation of a fame which time could not sensibly impair.

(A. C. S.)

LANDSBERG-AN-DER-WARTHE, chief town of a circle in the government district of Frankfort, in the province of Brandenburg, Prussia, is situated at the confluence of the Warthe and Kladow, 80 miles north-east of Berlin by rail. It has a gymnasium of the first class, a hospital, and a poorhouse, besides the other ordinary educational, charitable, and administrative provisions. The productive industry of Landsberg centres in the engine and boiler works and iron-foundries; but the other manufactures include a considerable miscellany, whose chief items are tobacco, cloth, carriages, woods, and spirits. An active trade is carried on in the manufactures of the town, and in the produce of the surrounding country. Landsberg dates its origin from about the middle of the 13th century. In 1875 its population was 21,379.

LANDSEER, SIR EDWIN HENRY (1802-1873), third son of John Landseer, A.R.A., a well-known engraver and able writer on art, was born in London, March 7, 1802. His mother was Miss Potts, who set to Reynolds as the gleemer, with a sheaf of corn on her head, in Macklin's Family Picture, or the Cottagers.¹ Edwin Henry Landseer began his artistic education under his father so successfully that in his fifth year he drew fairly well, and was acquainted with animal characters and passions. Richings of his, at South Kensington, dated by his father, attest that he drew excellently at eight years of age; at ten he was an admirable draughtsman, and his etchings show considerable sense of humour. At thirteen he drew a majestic St Bernard dog so finely that his brother Thomas engraved and published the work. At this date (1815) he sent two pictures to the Academy, and was described in the catalogue as "Master E. Landseer, 33 Foley Street." Youth forbids his being reckoned as an artist in full, and caused him to be considered as the "Honorary Exhibitor" of "No. 443, Portrait of a Mule," and "No. 584, Portraits

of a Pointer Bitch and Puppy." Adopting the advice of Haydon, whose pupil he was not otherwise, he studied the Elgin Marbles, the "Wild Beasts" in the Tower and Exeter Change, and dissected every animal whose carcass he could obtain. In 1816, in which year he exhibited with the Society of Painters in Oil and Water Colours, Landseer was admitted a student of the Royal Academy. In 1817 he sent to the Academy a portrait of Old Brutus, a much-favoured dog, which, as well as his son, another Brutus, often appeared in subsequent pictures. Even at this date Landseer enjoyed considerable reputation, and had more work than he could readily perform, because his renown had been zealously fostered by his father in Elmas's *Annals of Art*. At the Academy he was a diligent student and a favourite of Fuseli's, who would look about the crowded antique school and ask, "Where is my little dog boy?" The prices of his pictures at this time were comparatively small, ten guineas was, in 1818, considered enough for a whole length figure of a horse on a canvas of 27 by 35 inches, which now belongs to Lady C. Wellesley.

In 1818 Landseer exhibited at Spring Gardens Fighting Dogs getting Wind, a picture from which his future might have been predicted. The sale of this work to Sir G. Beaumont vastly enhanced the fame of the painter, who became "the fashion" in a way disclosed by Haydon's account of his own and Wilkie's positions under similar circumstances nearly at the same date. This picture is now at Coleorton, and it illustrates the culmination of the studies of Landseer's youth and the prime strength of his earlier style. Unlike the productions of his later life, this masterpiece of his boyhood exhibits not an iota of sentiment, but it is, in its way, a proof of astonishing vigour in design, and richer in animal character than anything produced since the death of Snyder. Perfectly drawn, solidly and minutely finished, bold in tone, and carefully composed, the execution of this picture attested the skill that had been acquired during ten years' observation from nature, and the learning with which diligent study of the best antiquaries and of Raphael had endowed the painter. Looking at the work as a whole, and valuing it on technical grounds, the critic feels that Landseer never produced anything better or so manly. On this level he stood until 1824, when he removed from his father's residence, and set up for himself in the house No. 1 (afterwards 18) St John's Wood Road, where he lived nearly fifty years, and in which he died. In 1818 it was little more than a cottage, with a barn attached, which was converted into a studio. Between 1818 and 1825 Landseer did a great deal of work, but on the whole gained little besides facility of technical expression, a greater zest for humour, and a larger style. The work of this stage ended with the production of Lord Essex's painting called the Cat's Paw, which is well known by an engraving. It was the price of this picture, £100, that enabled Landseer to set up for himself. He had to borrow a second hundred pounds to pay a premium for the house, and repaid this sum by twenty pounds at a time. Between 1818 and 1825 Landseer's pictures were such as proved the severity of his studies; among them the principal were the Cat Disturbed, which was lately in the possession of Sir P. de Malpas Grey Egerton, Alpine Mastiffs reanimating a Distressed Traveller, a famous work engraved by John Landseer; the Ratcatchers, which is now at Lambton Castle, Pointers to be; the Larder invaded, and Neptune, the head and shoulders of a Newfoundland dog. The Cat's Paw was sent to the British Institution in 1824, and made an enormous sensation. In this year Landseer and C. B. Leslie made a journey to the Highlands—a momentous visit for the former, who thenceforward rarely failed annually to repeat it in search of studies and subjects.

¹ John Landseer died February 29, 1853, aged ninety-one. Sir Edwin's eldest brother Thomas, an A.R.A. and a famous engraver, whose interpretations of his junior's pictures have made them known throughout the world, and will represent them when they have perished, was born in 1795, and died January 20, 1880. Charles Landseer, R.A., and Keeper of the Royal Academy, the second brother, was born in 1799, and died July 22, 1879. John Landseer's brother Henry was a painter of some reputation, who emigrated to Australia.

In 1826 Landseer was elected an A.R.A. In 1827 appeared the Monkey who had seen the World, a picture which marked the growth of a taste for humorous subjects in the mind of the painter, and had been evoked by the success of the Cat's Paw. Taking Buck, 1835, was the painter's first Scottish picture. Its execution marked a change in his style which, in increase of largeness, was a great improvement. In other respects there was a decrease of solid qualities; finish, searching modelling, and elaborate draughtsmanship rarely appeared in Landseer's work after 1835. The subject, as such, soon after this time became a very distinct element in his pictures; ultimately it dominated, and in effect the popularity of the artist was extended to a greater degree than technical judgment justified. Sentiment ruled in Landseer's works, which had previously depended on the expression of animal passion and character, and the exhibition of noble qualities of draughtsmanship. Sentimentality ruled in not a few pictures of later dates, and *gentle* human humour, or pathos, superseded that masculine animalism which noted in its energy, and enabled the artist to rival Spylers, if not Velasquez, as a painter of beasts. After High Life and Low Life, pictures of 1831, now in the National Gallery, Landseer's dogs, and even his lions and bulls, were more than half civilized. It was not that these later pictures were less true to nature than their forerunners, but the models were chosen from different grades of animal society. As Landseer prospered he kept finer company, and his new patrons did not care about rat-catching and dog-fighting, however vigorously and learnedly those subjects might be depicted. It cannot be said that the world lost much when, in exchange for the Cat Disturbed and Fighting Dogs getting Wind, came Jack in Office, the Highland Shepherd's Chief Mourner, and the Swannery invaded by Sea-Eagles, three pictures which are types of as many diverse moods of Landseer's art, and each a noble one.

Four years after his election as A.R.A. Landseer was chosen an R.A. (1830). Chevy Chase (1826), which is at Woburn, and the Illust Whiskey Still (1829), appeared in the interval, and were followed by High Life and Low Life (1831), and Spaniels of King Charles's Breed (1832); the last is a wonder of brush handling. Landseer had by this time attained such amazing mastery that he painted Spaniel and Rabbit in two hours and a half, and Rabbits, which was at the British Institution, in three-quarters of an hour; and the fine dog-picture Odin (1836) was the work of one sitting, i.e., painted within twelve hours. He began and finished a whole-length, life-size study of a fallow deer while Mr Wells of Redleaf was at church. A more remarkable feat consisted in drawing simultaneously, a stag's head with one hand and a head of a horse with the other. Harvest in the Highlands, and that masterpiece of humour, Jack in Office, were exhibited in 1833. In 1834 a noble work of sentiment was given to the world in Suspense, which is now at South Kensington, and shows a dog watching at the closed door of his wounded master. Many think this to be Landseer's finest work, others prefer the Highland Shepherd's Chief Mourner (1837). The over-praised and unfortunate Bolton Abbey, a group of portraits in character, was shown in the same year, and was the first picture for which the painter received £400. A few years later he sold Peace and War for £1500, and for the copyrights alone obtained £6000. Man Proposes (1864) was resold in 1881 for 6300 guineas, and a cartoon for 5000 guineas. A Distinguished Member of the Humane Society, a dog reclining on a quay wall (1838), was succeeded by Dignity and Impudence (1839). The Lion Dog of Malta, and Laying down the Law appeared in 1840. The Defeat of Comus was painted in the summer-

house of Buckingham Palace garden in 1843. In this year was finished the capital Highland Shepherd's Home (Sheepshanks Gift), together with the beautiful Eos, a portrait of Princes Albert's most graceful of greyhounds, to which Thomas Landseer added an ineffable charm and solidity not in the painting. The Challenge, and Coming Event cast their Shadows before, were accompanied (1844) by Shooing (Bell Gift), and followed by Peace, and War, and the Stag at Bay (1846). Alexander and Diogenes, and a Random Shot, a kid dead on snow, came forth in 1848. This year Landseer received a national commission to paint in the Houses of Parliament three subjects connected with the chase. Although they would have been worth three times as much money, the House of Commons refused to grant £1500 for these pictures, and the matter fell through, more to the artist's profit than the nation's gain. The Sanctuary, and Night and Morning, romantic and pathetic deer subjects, came in due order. For the latter a French jury of experts awarded to the artist the great gold medal of the Exposition Universelle, Paris, 1855.

The Dialogue at Waterloo (1850) commemorated Landseer's first visit to the continent, and showed how he, like nearly all English artists of original power and considerable fertility, owed nothing to French or Italian training. In the same year he received the honour of knighthood. The Monarch of the Glen (1851) was succeeded by Geneva, a group of asses, a mule, and a bull, Titania and Bottom, which comprises a charming queen of the fairies, and the dramatic scene of the Combat, or Night and Morning, as above. Then came the Children of the Mist (1853), Deer in Repose, Saved (1856), Bismarck, a noble stag, Rough and Ready, Uncle Tom and his Wife for Sale (1857), The Maid and the Magpie, the extraordinarily large cartoon called Deer Browning, the Two Dogs, and one or two minor paintings, were equal if not superior to any previously produced by the artist. Nevertheless, signs of breaking health were remarked in Doubtful Crumbs, and a Kind Star (1859). The immense and profoundly dramatic picture called a Flood in the Highlands (1860) more than renetated the painter before the public, but friends still saw ground for uneasiness. Extreme nervous excitability manifested itself in many ways, and in the choice (1864) of the dreadful subject of Man Proposes God Disposes, bears clumsily clambering among relics of Sir John Franklin's party, there was occult pathos, which some of the artist's intimates suspected, but did not avow. In 1862 and 1863 Landseer produced nothing, but with Man Proposes came a Piper and a Pair of Nutcrackers. The last triumph of Landseer's career was the Swannery invaded by Sea-Eagles (1869). After four years more, mainly of broken art and shattered mental powers, he died 1st October 1873. He was buried in St Paul's. See *Sir J. Landseer*, by F. G. Stephens, 1880. (P. O. S.)

LANDSHUT, chief town of a government district in Lower Bavaria, is situated on the right bank of the Isar, about 40 miles north-east of Munich. As the seat of government for the district, it contains all the appropriate administrative offices, and it is well supplied with educational and charitable institutions, besides having a convent and several nunneries. Of its numerous ecclesiastical buildings the most interesting are the churches of St Martin (with a spire 463 feet high), St Ludovics, and the Holy Ghost, all begun before 1411, and the old Dominican convent, now used as Government offices. The town-house, the former provincial buildings, and the palace are also noteworthy. On a hill commanding the town is the castle of Trausnitz, an ancient stronghold of the dukes of Lower Bavaria. The original castle was built in the 12th century, but the oldest part now extant dates from about 1304. In 1872-73 the upper part was put into habitable order by the king of

Davaria. The manufactures of Landslut are not important, they include beer, cloth, and tobacco. Market gardening and, to a really considerable extent, trade in grain are carried on. From 1300 to 1826, when the university, formerly at Ingolstadt and now at Munich, was located at Landslut, the town woke up to a temporary importance. The name Dreihelm Stadt is sometimes given to Landslut from the three helmets that form its arms. The population in 1875 was 14,780.

LANDSKRONA, one of the principal seaport and garrison towns in Sweden, is situated in the district of Malmö (in Skania) on the Sound (Öresund), about 55 miles west of Christianstad and 15 miles by water from Copenhagen. It is connected by a branch line with the south Swedish railway system. The harbour, protected by the island of Gråten, is the deepest and best on the Skanian coast, and possesses excellent quays. A Swedish line of steamers runs regularly to Lubeck. Wood, grain, and clay are largely exported. In 1880 the number of foreign vessels entering the port was 1554, with a total burden of 135,894 register tons. Landskrona is one of the chief industrial towns of Sweden, the largest manufacture being sugar refining. The population was 7323 in 1868, and 9913 in 1880.

Landskrona, originally called Landora or Landor, owes its first importance to King Erik XIII., who introduced a body of Carmelite monks from Germany in 1410, and bestowed on the place the same privileges as those enjoyed by Malmö. In 1423 it was plundered by the forces of the Wendish towns, and during the wars of the 16th and 17th centuries it played too conspicuous a part for its own prosperity. Horn took the town by storm in 1644; Ruyter blockaded the Swedish fleet in its harbour in 1677; and in 1676 was fought in the neighbourhood the great battle of Landskrona, which saved Sweden from the Danish invaders.

LANE, EDWARD WILLIAM (1801-1876), one of the greatest of European Arabists, was the son of Dr Theophilus Lane, a prebendary of Hereford. He lost his father in boyhood, and his character was mainly formed by the influence of his mother, a woman of strong and beautiful nature. He was designed for Cambridge and the church, and became proficient in mathematics, but, abandoning the purpose of proceeding to the university, gave himself for some time to the study of engraving. Weak health, aggravated by intense application to Eastern study, compelled him to throw aside the burn, and in 1825 he started for Egypt, where he spent three years, twice ascended the Nile, proceeding as far as the second cataract, and composed a complete description of Egypt, with a portfolio of one hundred and one drawings. This work was never published, but the account of the modern Egyptians, which formed a part of it, was accepted for separate publication by the Society for the Diffusion of Useful Knowledge. To perfect this work Lane again visited Egypt in 1833-35, residing mainly in Cairo, but retiring to Luxor during the plague of 1835. An interesting journal of this visit to Egypt is included in the memoir by his grand-nephew prefixed to the sixth part of his great *Lexicon*. Perfected by the additional observations collected during these years, the *Modern Egyptians* appeared in 1836, and at once took the place which it has never lost as the best description of Eastern life and an Eastern country ever written. In accuracy, completeness, and graphic simplicity of description the book approaches ideal perfection. It was followed from 1838 to 1840 by a translation of the *Arabian Nights*, with a mass of valuable notes and illustrations, designed to make the book a sort of encyclopædia of Eastern manners, and rivaling the merit of his first work. The translation itself is an admirable proof of scholarship, but is characterized by a somewhat stilted mannerism, which is not equally appropriate to all parts of the motley-coloured original. The character of some of the tales, and the tedious repetitions of the same theme which are found in

the Arabic collection, induced Lane to leave considerable parts of the work untranslated. In 1840 Lane married a Greek lady. A useful volume of *Selections from the Kur-an* was published in 1843, but before it passed through the press the indefatigable author was again in Egypt, where he spent seven years (1842-49) collecting materials for a great Arabic lexicon, which the munificence of Lord Pimlico (afterwards duke of Northumberland) enabled him to undertake. The most important of the materials amassed during this sojourn (in which he was accompanied by his wife and by his sister, Mrs Poole, authoress of the *Englishwoman in Egypt*, with her two sons, after wards well known in Eastern letters) was a copy in 24 thick quarto volumes of Sheikh Mutadî's great lexicon, the *Tuy et Arâs*, which, though itself a compilation, is so extensive and exact that it formed the main basis of Lane's subsequent work. The author, who lived in Egypt in last century, used more than a hundred sources, interweaving what he learned from them with the *Kutûb* of Firuszâdî in the form of a commentary. By far the larger part of this commentary was derived from the *Lisân el 'Arab* of Ibn Makarram, a work of the 13th century, which Lane was also able to use while in Cairo.

Returning to England in the year 1849, Lane devoted the whole remainder of his life to the task of digesting and translating his Arabic material in the form of a great thesaurus of the lexicographical knowledge of the Arabs. In spite of weak health he continued this arduous task with unflagging diligence till a few days before his death, which took place at Worthing 10th August 1876. The work remains unfinished; five parts appeared during his lifetime (1863-1874), and two smaller parts have since been published from his papers. Even in its imperfect state the *Lexicon* is an enduring monument, the completeness and finished scholarship with which it is executed making each article an exhaustive monograph. All Lane's work has the stamp of masterly perfection. He produced no occasional writings, and two essays contributed to the magazine of the German Oriental Society complete the record of his publications. Lane was not an original mind; his powers were those of observation, industry, and sound judgment. He had singular tact in accommodating himself to the Eastern character, he lived in the East as an Oriental; and his familiarity with Eastern life and ways of thought was unique. His personal character was elevated and pure, his strong sense of religious and moral duty being of the type that characterized the best circles of English evangelicalism in the early part of this century.

LANFRANCO (c. 1005-1089), thirty-fourth archbishop of Canterbury, and first after the Conquest, one of the ablest churchmen and scholars of his time, was the son of Hambald or Hambold, one of the principal citizens of Pavia, and was born there about the year 1005. Deprived of his father at an early age, he seems to have been educated at Pavia with a view to taking his hereditary place in the governing class, but to have developed a love of learning for its own sake, which induced him to visit other schools; on his return, after a long absence, he became teacher of jurisprudence in his native town. About 1039, driven from home by the disturbances then prevalent in Italy, and attracted by what he had heard of the need and demand for a supply of competent scholars in Normandy, he with some learned companions migrated thither and set up a school at Avranches, which met with great success. Some three years afterwards (1042), having formed the resolution to become a monk, he suddenly withdrew from his promising career as a secular teacher. The causes which led to this change in the plan of his life are not known. Hook thinks it was suggested by the death of his wife, which

there is some reason to believe happened about this time; but, however it may have been occasioned, the fact that a man of his energy and strength of will should, although somewhat late in life, have transferred himself to a career which not only was universally supposed to involve great spiritual advantages, but must also have been seen to offer a peculiarly favourable field for the exercise of his special talents and acquirements, need cause no surprise. After a lengthened novitiate of ascetic humiliation and seclusion in the Benedictine monastery of Bec, then under the presidency of abbot Herluin, Lanfranc was at last called upon to resume the work of teaching; his fame speedily attracted numerous pupils, and it became necessary to enlarge the conventual buildings. He now became prior, with full control of the internal discipline of the establishment (1046). Among those who became his pupils about this time are mentioned Witmund (afterwards bishop of Aversa), Anselm of Aosta (afterwards of Canterbury), and Anselm of Lucca (afterwards Pope Alexander II.). It was during his priorship at Bec that Lanfranc began to figure somewhat prominently in the eucharistic controversy associated with the name of Berengarius of Tours. This able but unfortunate controversialist, while maintaining the doctrine of a real presence of Christ in the Eucharist, had denied that presence to be one of essence, or the change effected to be one of substance. In doing so he had placed himself in an attitude of opposition not so much to the lately formulated theory of Paschasius Radbertus as to the entire current of ecclesiastical opinion then prevalent. The earliest extant letter of Berengarius to Lanfranc implies a previous friendship, but is written in a tone of remonstrance, beseeching the latter not to treat as heretics those who had Scripture on their side and could also claim the support of Ambrose, Augustine, and Jerome. It is to be regretted that we are not in possession of more of the correspondence, and especially that we are left entirely to conjecture with regard to the circumstances which occasioned it. It seems to have been somewhat compromising to Lanfranc, for at the Easter synod held at Rome in 1050, which he had been summoned to attend, the prior of Bec was, after the condemnation of the absent Berengarius, called upon to vindicate his own orthodoxy by a public confession of his faith. He had no difficulty, however, in thus purging himself of all suspicion of heretical privacy, and was afterwards present in September, by special request, at the synod of Vercelli, where Berengarius, again absent, was excommunicated. A personal controversy was renewed by Berengarius from time to time, but, so far as we know, Lanfranc's share in it came to an end with the composition (probably some time between 1063 and 1069) of his *Liber de Corpore et Sanguine Domini Nostri contra Berengarium*. Other events of much more exciting and absorbing personal interest to him had meanwhile intervened. In 1053 William of Normandy, in spite of the express prohibition of the council of Rheims (1049), had married his cousin Matilda, daughter of Baldwin, duke of Flanders,—a defiance of ecclesiastical authority which involved the highest ecclesiastical censures. The now powerful prior of Bec was not slow to express his condemnation, which he further accentuated by his contemptuous treatment of Herfast, the duke's chaplain, who had been sent on some errand of conciliation. Peremptorily ordered to leave the duchy, Lanfranc, when setting out on his journey into exile on an excessively lame horse, whether by accident or design came across the path of William; some genial touch of humanity and good humour suddenly converted them (such is the import of the Chronicles) into firm friends, the prior accompanied the duke to his castle, and shortly afterwards undertook a mission to Rome for a papal dispensation which should legalize the obnoxious

marriage. This was obtained in 1059, Lanfranc's influence with William and Matilda steadily increased, and soon the abbey of St Stephen and of the Holy Trinity at Caen—part of the price of the papal grace—began to rise. In 1063 the former building was sufficiently far advanced to be fit for use, and, at the urgent request of the founder, Lanfranc became its first abbot. In this position he was one of the most intimate advisers of William during the anxious times which immediately preceded and followed the Conquest. Already destined for the more splendid if more arduous see of Canterbury, he, doubtless with the royal approval, declined that of Rouen, which had been put within his reach in 1067. In 1070 he was, at the Whitsungmot held at Windsor, chosen to the primacy of England, vacant by the deposition of Stigand; and, at a synod in Normandy where the legates of the pope were present, he was constrained to accept, vainly pleading "his weakness and unworthiness, his ignorance of a foreign tongue, and the barbarism of the nations he was thus compelled to visit." His consecration took place on August 29, 1070, in a temporary structure raised on the site of the cathedral which had been destroyed by fire three years before; and in the following year he went to Rome to receive the pallium from his former pupil Alexander II. The pope received him with great cordiality, giving him a second pallium for old friendship's sake, but he did not thereby succeed in attaching the new archbishop to the ultramontane policy; during the nineteen years of the primacy of the brilliant Lombard it became ever more apparent that neither Hildebrand's, nor Lanfranc's, but William's was the master mind in England. Lanfranc ably seconded the Conqueror in the line of action which resulted in the subordination of York to Canterbury, and also in the gradual removal from power of all English prelates and abbots, and their replacement by foreigners, until at last Wolfstan of Worcester was the only Anglo-Saxon left undisturbed; but, if these measures were fitted in some ways to denationalize the English Church, and bring it into closer relation with the central authority at Rome, any such tendency was more than counterbalanced by the legislation, also supported by Lanfranc, which placed the royal supremacy on a footing which it had never before attained. Thus it was enacted that bishops, like barons, were to pay homage to the crown, and the clergy were to acknowledge no one as pope until the royal consent had first been obtained, that no letters from Rome were to be published till approved by the king, that no council was to pass laws or canons except such as should be agreeable to the king's pleasure; that no bishop was to be implicated or punished any of the king's vassals without the king's precept; and that no ecclesiastic was to leave the country without leave obtained. As regarded church discipline the Hildebrandine reforms were followed, but with wisdom and moderation; thus strict regulations against simony were enforced, but with respect to clerical celibacy a distinction was drawn between the parochial and the capitular clergy, the former being permitted to retain their wives. A striking illustration of the recognized ecclesiastical independence of England under William and his able minister is furnished in the fact that, in the very year (1076) of the synod of Winchester at which so important a modification of the decrees of a Roman council had been resolved on, Lanfranc along with Thomas of York and Remigius of Dorchester presented themselves at the holy see in a mission from the king to seek a confirmation of certain ancient privileges, and that they were successful in their application. No less eloquent is the fact that, after William's rejection of Gregory's demand for his homage, Lanfranc had the courage to refuse the papal summons to appear at the threshold of the apostles. After his return

from Rome in 1076 and the consecration of the new buildings at Bes in which he took part in 1077, he does not appear to have again left England. As regards his administration of his own diocese, Lanfranc's principal achievements were the rapid rebuilding of the metropolitan church (1073-79), the reforms he introduced among the monks of Christ Church, and his successful recovery of the estates of the see, which had been encroached on by the king's brother bishop Odo, earl of Kent. Lanfranc died at Canterbury in 1089.

The extant works of Lanfranc are not voluminous. The *Enchiridion Liber* contains fifty-five of his own letters, many of them of considerable interest and importance, as well as some of those of his distinguished correspondents, — Beconatus, William, Pope Alexander II. and Gregory VII. The short *Oratio in consilio habita* represents his argument before the synod of Winchester in 1072 in support of his claims to the primacy. *Statuta pro ordine Beneficiorum* are an adaptation and expansion of the ordinary Benedictine rules, written, when he was primate, especially for his own monks. *Sermo ante Scripturam* also relates to the duties of monks. *Libellus de orationis confessione* has no special interest. *Commentarius in D. Pauli epistolam* seems rather to be a collection of some student's notes than to have been prepared for publication by himself. *Expositum seu dialogus de summa fidei Christianae theologiae*, the most voluminous of all the works assigned to him, is of more than doubtful genuineness, but it certainly is an adequate sketch of the scholastic theology in its infantile stage. Most important is the *Tractatus de Corpore et Sanguiue Domini*, a vigorous and even violent defence of the dogma of transubstantiation, for which it helped to secure currency and permanency, but it adds little to what had already been said by Paschasius Radbertus.

The Benedictine edition of the works of Lanfranc by D'Achéry, in one folio volume (Paris 1648), was republished at Lyons in 1877. A new edition by Gilks appeared at Oxford in two octavo volumes in 1884. The authorities for the life and times of Lanfranc are the *Chronicon Berconense*, and *Vita Alstorum Berconensis* (which are printed in the *Scriptores in usum Scholasticum* of Ordine Cisterciensis. See also, *Acts of the Archbishops of Canterbury* vol. II, and Freeman's *New Man Conquest*, vols. II-IV. (J. S. B.L.)

LANFREY, PIERRE (1828-1877), the historian who has done the most to destroy the Napoleonic legend of M. Thiers, was born at Chambéry, the capital of Savoy, on the 26th October 1828. His father came of a warlike race, which had been noble for four centuries, and had himself served in the army of Napoleon as a captain of hussars. On the fall of Napoleon he had left the French army, and retired to Chambéry, where he married a milliner. When young Pierre was but six years old, his father died, cursing the priest who came to bring him consolation, and his education was left to his mother. She sent him first to the Jesuit college of Chambéry, from which he was expelled for writing an attack on the Jesuits, then to another ecclesiastical seminary, which equally disgusted him, and at last to the Lycée Bourbon at Paris. After completing his studies at Paris he went to Grenoble in 1847 to study law, and while there took the keenest interest in the Revolution of 1848 at Paris. Even at that age he shows in his letters the hatred of democracy which was always to characterize his sincere love of liberty, and above all his intense feeling that Paris should not always dominate the provinces. His law studies finished at Grenoble, he went to Turin, and qualified himself to act as *avocat* in his native country; but, on the news of the coup d'état, his passion to go to Paris and take his part in the inevitable struggle which he saw must arise between the second empire and the spirit of liberty was not to be restrained, and in 1853 he once more took up his abode in Paris. He at first tried in vain to get work on various newspapers, and then to get his first book, which had been sketched out for some years, published. No publisher was to be found, and *L'Église et les Philosophes au XVIII^{ème} Siècle* was printed eventually at his own expense. It appeared in 1855, and at once achieved a great success, and introduced its author to some of the best literary society in Paris. It was followed in 1857 by an *Essai sur la Révolution française*, and in 1860 by the *Histoire politique des Papes*, and the *Lettres d'Évergard*. The latter are a revelation of what Lanfrey thought and

felt at this time, of his despair that France would ever get free from the enervating rule of the second empire, of his disgust at the literary sterility of the time in confining itself to vague philosophy and vaguer criticism; and through them he first became known outside the literary world. He had hitherto been intimate with such choice spirits as Ary Scheffer, Gleyre, and the Comtesse d'Agoult, better known as Daniel Stern, but the *Lettres d'Évergard* introduced him to the most fashionable Parisian society of the time, and the position he held in it is best to be found in the description of him contained in the souvenirs of his friend, Madame Clara Joubert. In 1860 also he was appointed by M. Charpentier editor of the new *Revue Nationale*, in which he wrote the fortnightly chronicle of affairs for four years, besides various articles and reviews, collected in 1864 under the title of *Études et Poésies politiques*. After resigning his editorship in 1864 he set to work on his great *Histoire de Napoléon I.*, in which he intended to overthrow the monument M. Thiers had erected to Napoleon in his *Histoire du Consulat et de l'Empire*, and to show the demigod uncle of Napoleon III to have been but an immoral man and bad politician. The fourth volume of his history had not been published three months when the war of 1870 broke out. At first Lanfrey knew not what view to take, but on the defeats of the French, and the declaration of the republic, he enlisted as a simple volunteer, and marched to Lyons with his battalion. While there he heard first that his vigorous opposition in the press to the powerful influence of M. Gambetta had lost him his election to the Constituent Assembly in his native province, and next that he had been elected by the department of the Bouches du Rhône, in which he had never set foot. In the Assembly he warmly supported the Government of M. Thiers, and opposed the radical party as vehemently as he had opposed the empire, saying that both savoured of tyranny. In 1871 M. Thiers appointed him French minister in Switzerland, where he remained till 1874, when he insisted on his resignation being accepted by the Duc de Broglie, and once more took his seat as a moderate republican. In 1875 he published the fifth volume of his *Histoire de Napoléon*, and in 1876 was elected a life senator; but his strength was fast failing, and, before he could give his sixth volume the careful revision he considered indispensable, he died at Pau on the 16th November 1877.

The first predominant idea of Lanfrey, both as a politician and an historian, was a love of liberty which was perpetually putting him in opposition to all parties in turn. In his first book he attacked the church, not because of its doctrines so much as because of its attempts to stifle liberty of thought. In his *Essai sur la Révolution*, on the other hand, he assailed Robespierre and the democrats because they defended attempts on individual liberty with the assertion that they were necessary for liberty in general. His second leading idea was a belief in strictest morality in politics; by this standard in his *Études* he condemns M. Thiers for slurring over the political immorality of Napoleon, Danton for giving up his old Girondin standpoint to defend the consular, and Carnot for putting his name to measures of the committee of public safety which he abhorred, in order to maintain himself in power. These two ideas, love of liberty, involving a hatred alike of despotism and democracy, and a stern standard of political morality, are to be seen throughout Lanfrey's great work on Napoleon. No military success ever to him seems to compensate for immoral means to gain an end, no glamour is for him cast over evil actions by glory or fine words; no sarcasm is too severe for the man who cared not for truth but only for effect. Before such a judge Napoleon appears but a small man, and, if at times the judgment seems almost too severe, it must be remembered that the author lived through a time when an emperor ruled entirely owing to the influence that the great deeds of his uncle had thrown over the minds of the French people, and that he wrote with the intention of for ever breaking down that influence by exhibiting the naked truth, and destroying for ever the Napoleonic legend.

For Lanfrey's life consult three articles by the Comte d'Haussonville in the *Revue des Deux Mondes* for September, October, and November 1881, the biographical notice of M. de Presnac, prefixed to the last edition of his works; and the numerous letters from him contained in the *Souvenirs* of Madame Joubert.

LANGENSALZA, chief town of a circle in the government district of Erfurt, in the province of Saxony, Prussia, is situated on the Salza, about 20 miles north-east of Erfurt. It has an old castle, several schools of various grades, and three hospitals, and near it are the remains of the old monastery of Homburg. The manufacture of cloth is the chief industry, but lace, starch, and chemicals are also produced. The population of the town in 1875 numbered 9855. There is a sulphur bath in the neighbourhood. Near Langensalza the Prussians and Hanoverians had a long and bloody engagement, June 27-29, 1866, which ultimately resulted in the capitulation of the latter.

LANGLAND, or *LANGLEY, WILLIAM*, the author of a remarkable poem belonging to the close of the 14th century, of which the full title is—*The Vision of William concerning Piers the Plowman, together with Vita de Do-wel, Do-bet, et Do-best, secundum Wit et Resoun*.¹

The author's name is not quite certain, and the facts concerning his life are few and scanty. As to his Christian name we are sure, from various allusions in the poem itself, and the title *Piers Willem*, &c., in many MSS., and we may at once reject the suggestion that his name may have been Robert. In no less than three MSS. occurs the following colophon:—"Explicit visio Willelmi W. de Petro le Plowman." What is here meant by W it is difficult to conjecture; but it is just possible that it may represent Wychwood (of which more presently), or Wigornensis, i.e., of Worcester. As to the surname, we find the note that "Robert or William Langland made pers ploughman," in a handwriting of the 15th century, on the fly-leaf of a MS. copy belonging to Lord Ashburnham, and in a Dublin MS., is the note:—"Memorandum, quod Stacy de Rokyle, pater Willelmi de Langland, qui Sciacus fuit generosus, et morabatur in Schiptons-under-Widewode, tenens domini le Spenser in comitatu Oxon., qui predictus Willelmus fecit librum qui vocatur Piers Ploughman." Nevertheless, it would seem that Langland should rather be Langley, since there is no trace of any Langland family in the midland counties, while the Langley family were wardens of Wychwood forest in Oxfordshire between the years 1278 and 1362. The question has been fully discussed by Professor Pearson in the *North British Review*, April 1870, p. 244. According to Bale, our author was born at Cleobury Mortimer, which is quite consistent with the supposition that his father may have removed from that place to Shipton in Oxfordshire, as there seems to have been a real connexion between the families in those places. It must not be omitted that in the parish of Shipton-under-Wychwood there is a hamlet named Langley, from which he may have received his name.

The internal evidence concerning the author is fuller and more satisfactory. By piecing together the various hints concerning himself which the poet gives us, we may compile the following account. His name was William (and probably Langley), and he was born about 1332 perhaps at Cleobury Mortimer in Shropshire. His father, who was doubtless a franklin or farmer, and his other friends put him to school, made a "clerk" or scholar of him, and taught him what Holy Writ meant. In 1362, at the age of about thirty, he found himself wandering upon the Malvern hills, and fell asleep beside a stream, and saw in a vision a field full of folk, i.e., this present world, and many other remarkable sights which he duly records. From this supposed circumstance he named his poem *The Vision of William*, though it is really a succession of visions, since he mentions several occasions on which he awoke, and

afterwards again fell asleep; and he even tells us of some adventures which befel him in his waking moments. In some of these visions there is no mention of Piers the Plowman, but in others he describes him as being the coming reformer who was to remedy all abuses, and restore the world to a right condition. It is remarkable that his conception of this reformer changes from time to time, and becomes more exalted as the poem advances. At first he was no more than a ploughman, one of the true and honest labourers who are the salt of the earth, but at last he is identified with the great reformer who has come already, the regenerator of the world in the person of Jesus Christ. We may, in fact, consider Piers the Plowman as representing Christ himself, or, in the author's own phrase—"Petrus est Christus." If this be borne in mind, it will not be possible to make the mistake into which so many have fallen, of speaking of Piers the Plowman as being the author, not the subject, of the poem. The author may best be called William, or we may even give him the nickname of Long Will, which, as he himself tell us, was bestowed upon him from his tallness of stature,—just as the poet Gascoigne was familiarly called Long George. Though there is mention of the Malvern hills more than once near the beginning of the poem, it is abundantly clear that the poet lived for "many years in Cornhill (London), with his wife Kitte and his daughter Calote." He seems to have come to London not long after the date of the first commencement of his work, and to have long continued there. He describes himself as being a tall man, one who was loath to reverence lords or ladies or persons in gay apparel, and not deigning to say "God save you" to the sergeants whom he met in the street, unsomuch that many people took him to be a fool. He was very poor, wore long robes, and had a shaven crown, having received the clerical tonsure. But he seems only to have taken minor orders, and earned a precarious living by singing the *placebo, dirige*, and seven psalms for the good of men's souls. The fact that he was married may explain why he never rose in the church. But he had another source of livelihood in his ability to write out legal documents, and he was extremely familiar with the law courts at Westminster. His leisure time must have been entirely occupied with his devotion to his poem, which was essentially the work of his lifetime. He was not satisfied with rewriting it once, but he actually rewrote it twice; and from the abundance of the MSS., which still exist we can see its development from the earliest draught, written about 1362, to its latest form, written after 1390. It is remarkable that the intermediate form, written later than 1370, is perhaps, taken upon the whole, the best of the three.

In 1399, just before the deposition of Richard II., appeared a poem addressed to the king, who is designated as "Richard the Redeles" i.e., devoid of counsel. This poem, occurring in only one MS., in which it is incomplete, breaking off abruptly in the middle of a page, may safely be attributed to the same author, who was, at the time, passing through Bristol. As he was then about sixty-seven years of age, we may be sure that he did not long survive the accession of Henry IV. It may here be observed that the well-known poem entitled *Piers Ploughman's Creed*, though excellently written, is certainly an imitation by another hand, viz., by the anonymous author of *The Plowman's Tale*, which is inserted in the black-letter editions of Chaucer, though it is none of his. The *Piers Ploughman* of the *Crede* is very different in conception from the subject of William's vision.

As regards the poem itself, it has been already said that it exists in three forms. If we denote these by the names of A-text, B-text, and C-text, we find, of the first, twelve MSS.; of the second, sixteen; and of the third, also sixteen MSS. A few of these show confusion between the different types, but they may roughly be

¹ The title is usually given in Latin as *Vision Willelmi de Petro Plowman*, &c., and the whole work is sometimes briefly described as *Liber de Petro Plowman*.

classed as above, and it will be seen that we thus have abundance of material, a circumstantiality which proves the great popularity of the poem in former times. Owing to the frequent expressions which indicate a desire for information in religion, it was, in the time of Edward VI., considered worthy of being painted. Three imitations were printed by Robert Crowley in 1550; and one of these was badly reprinted by Owen Rogers in 1561. In 1813 the best MS. of the C-text was printed by D. Whitham in an expensive form. In 1842 Mr Thomas Wright printed an edition from an excellent MS. of the D-text in the library of Trinity College, Cambridge (second edition, 1856). A complete edition of all three texts was undertaken, for the Early English Text Society, by the Rev W. Skeat, but is not yet finished (1881). Vols. i., ii., and iii., containing the three texts, and the poem of *Richard the Redeless*, appeared in 1886, 1890, and 1873 respectively, and a part of vol. iv., containing full notes to all three texts, with some indexes, in 1877.

The general contents of the poem may be inferred from a brief description of the latest text. This is divided into twenty-three passages, usually comprising four parts, called respectively *Visio de Petro Plowman*, *Visio de Do-vel*, *Visio de Do-bet*, and *Visio de Do-best*. Here *Do-bet* signifies "do better" in modern English, and the author's own explanation of the names is that he who does a kind action *does well*, he who touches others to act kindly *does better*, but he who combines both practice and theory, both doing good himself and teaching others to do the same, *does best*. But the visions by no means closely correspond to these descriptions, the poet really gives as a set of eleven visions, which may be thus enumerated:—(1) *Visio of the Seven Tails of Folk*, of Holy Church, and of the Lady Meek (passus i-v.); (2) *Visio of the Seven Deadly Sins*, and of Piers the Plowman (pass. vi.-x.); (3) *Wit, Sturdy, Clergy, and Scripture* (pass. xi., xii.), (4) *Fortune, Nature, Reason, and Reason* (pass. xiii., xiv.), (5) *Visio of Imaginative* (pass. xv.); (6) *Conscience, Patience, and Active-Vite* (pass. xvi., xvi.), (7) *Free-will*, and the *Tree of Charity* (pass. xviii., xix.), (8) *Fortitudo*, Hope, and Charity (pass. xx.), (9) *The Triumph of Piers the Plowman*, i.e., the Crucifixion, Burial, and Resurrection of Jesus Christ (pass. xxi.), (10) *The Vision of Grace* (pass. xxii.); (11) *The Vision of the Seven Deadly Sins*.

This bare outline gives but little idea of the real nature of the poem. The general plan of it is slight and somewhat vague, but the execution is vivid and remarkable. The author's object was to afford himself opportunities by the way (of which he has amply availed himself) of describing the life and manners of the poorer classes; of inveighing against the worldliness and the abuses of the friars, of representing the miseries caused by the great pestilences then prevalent and by the hasty and ill-considered marriages consequent thereupon, and of denouncing lazy workmen and sham beggars, the corruption and bribery then so common in the law courts, and all the numerous forms of falsehood which are at all times the fit subjects for satire and indignant exposure. In describing, for example, the seven deadly sins, he gives so exact a description of Glutton and Sloth that the readers feel that these are no mere abstractions, but drawn from the life, and it becomes hardly more difficult to realize Glutton than it is to realize Sir John Falstaff. The numerous allegorical personages so frequently introduced, such as Scripture, Clergy, Conscience, Patience, and the like, are all mouthpieces of the author himself, uttering for the most part his own sentiments, but sometimes speaking in accordance with the character which each is supposed to represent. The theological disquisitions which are occasionally introduced are somewhat dull and tedious, but the earnestness of the author's purpose and his energy of language tend to relieve them, and there are not many passages which might have been omitted without loss. The poem is essentially one of those which improve on a second reading, and is a linguistic monument of very high value. As extracts from the poem, even if rather numerous and of some length, fail to give a fair idea of it. The whole deserves, and will repay, a careful study. Indeed, there are not many single works from which a student of English literature and of the English language may derive more substantial benefit.

The metre is alliterative, and destitute of final rhyme. It is not very regular, as the author's earnestness led him to use the fittest words rather than those which merely served the purpose of rhythm. The chief rule is that, in general, the same letter or combination of letters should begin every second syllable in the same line, for example, in the line which may be modernized thus: "Of all manner of men, the mean and the rich." Sometimes there are but two such rhyme-letters, as: "Might of the commons made him to reign." Sometimes there are four, as: "In a summer season, when soft was the sun, the sun was in invariably a pause, more or less distinct, in the middle of each line."

See the edition already referred to; the *Deportment of Richard II.*, ed. T. Wright (London Society), which is the same poem as *Richard the Redeless*; *Warton, Hist. of Eng. Literature*, vol. i., p. 100; *Johnson, Lives of the Poets*, vol. i., p. 100; *Lectures on English Literature*, by H. Morley, English Writers, &c. A long and careful summary of the whole poem is given in *Illustrations of English Literature*, by H. Morley, &c., iii.

(W. W. L.)

LANGRES, a town in the département of Haute-Marne, France, 136 miles south-east from Paris, stands at a height of some 1550 feet, upon a jutting promontory of the table-land to which it gives its name (Plateau de Langres), and overlooks, eastward and westward respectively, the valleys of the Marne and its tributary the Bonnelle. Its situation involves a rigorous climate, but also gives it strategic importance. The citadel stands to the south of the town, where it joins the table-land. From the ramparts and the cathedral tower there is an extensive view over the valley of the Marne, the Vosges, and the Côte d'Or; and in clear weather Mont Blanc (160 miles distant) is visible. Several detached forts and numerous batteries make Langres one of the strongest fortified camps of the country. The cathedral, the choir and nave of which date from the 12th and 13th centuries, possesses some fine features, but has been debased by a front in the style of the 17th century. The church of St Martin possesses a Christ, which is one of the finest wood-carvings known. The Gallo-Roman gate, one of four entrances to the town in the time of the Romans, is conjectured to have been intended as a triumphal arch to some victorious emperor, perhaps Marcus Aurelius. The gate "des moulins" is now the most noteworthy in the town. Langres possesses an antiquarian museum and a rather important library, as well as a picture gallery. The cutlery which bears the name of Langres is manufactured in the neighbourhood. Population, 10,878.

The town takes its name from the *Langones*, who occupied it in the time of Caesar. Under the Capets its bishop was an ecclesiastical peer of the kingdom, and held the sceptre at royal coronations.

LANGTON, STEPHEN (c. 1160-1228), cardinal, fourth archbishop of Canterbury, was born about the middle of the 12th century; the place of his birth is unknown, but his family almost certainly belonged to Yorkshire. He had already been made a prebendary of York, most probably at an early age, when he went to France and entered the university of Paris; there he soon rose to distinction alike in philosophy and theology, and ultimately, it is said, became chancellor or at least attained high rank in the governing body. One of his fellow students and intimate friends in Paris was Lothario, the nephew of Clement III., who when he in 1198 succeeded Celestine III. as Innocent III. forthwith appointed Langton to a post in his household. In 1206 he became cardinal priest of St Chrysogonus, a promotion on which he received the written congratulations of his sovereign King John. It was shortly after this that he first became involved in the great constitutional struggles with which his name is so honourably associated. In 1205 Hubert Walter of Canterbury had died, and there were urged at Rome the claims of two rival candidates for the vacant see,—Reginald the subprior of Christ Church, Canterbury, who had been the sudden and unauthorized choice of a majority of the monks, and John de Gray, bishop of Norwich, whom the dissenting minority had subsequently elected with the royal sanction. Setting aside both claims, and also the appeal of the suffragans of Canterbury with the chapter, who maintained that the right of election was theirs, Innocent commanded the monks then present in Rome to proceed to a new election in his presence, Langton being the candidate set before them. Elected he accordingly was, and afterwards consecrated by the pope himself at Viterbo in June 1207. John immediately retaliated by banishing the monks of Canterbury, afterwards writing an angry and threatening letter to the pope. Innocent replied with firmness, but finding John immovable, ultimately declared his resolution to enforce submission to his will by laying England under an interdict, a resolution which was carried into effect in March 1208. For the next few years, all negotiations for his admission to his see having failed, Langton had his

home in the Cistercian monastery of Pontigny near Sens in France, which thus became a principal resort of English malcontents and refugees. In the summer of 1212 he accompanied the bishops of London and Ely to Rome, and it was in consequence of their representations that deposition was passed upon John, the same prelates were also present at the great assembly of Soissons (April 1213), where a crusade against the king of England was set on foot, under the leadership of Philip of France. In the following May John made his peace, agreeing to recognize Langton, receive the exiled clergy, and restore the property which he had confiscated. Langton did not actually reach England till July, when (July 30, 1213) he performed his first episcopal act by pronouncing the absolution of the excommunicated John, who swore that all the laws of his grandfather Henry I. should be kept by all throughout the kingdom, and that all unjust laws should be utterly abolished. This oath the king was held by the archbishop to have violated almost immediately in levying war irregularly against the barons who had, not illegally, deserted him at Portsmouth, and at the meeting held in St Paul's, London, on August 25, 1214, it was Langton who produced the old charter of Henry I., and suggested the demand for its renewal, a suggestion which in the following year issued in the concession of Magna Charta at Runnymede. Soon afterwards the archbishop left England for Rome to attend the fourth Lateran council, but not before he had by the commissioners of the pope been pronounced contumacious, and declared to be suspended for his refusal to publish the excommunication of the English barons who had joined in obtaining the great charter. At Rome, where the sentence of his suspension was confirmed, he remained from November 1215 till May 1218; in September of the latter year he presided in the council held at London, where Magna Charta was solemnly confirmed; and on May 17, 1220, he officiated at the re-coronation of Henry III. In the same year the "translation" of St Thomas of Canterbury took place. Among the fragmentary notices we possess of the remainder of Langton's life are mentioned his demand in name of the barons for royal confirmation of the charter at London in 1223. He died at Slindon on July 9, 1228.

The principal authority for the events of the life of Langton is the *Chronicle* of Roger of Wendover. See Hook's *Lives of the Archbishops of Canterbury*, vol. II.; Pearson's *History of England*, vol. II., and Paul's continuation of Leppenberg's *Geschichte von England*, vol. III.

LANGUAGE. See PHILOLOGY.

LANGUEDOC, a province of France, which lay between the Garonne on the west and the Rhone on the east, with the Pyrenees and the Mediterranean on the south. It was divided into the three *sénéchaussées* of Toulouse, Carcassonne, and Beaucaire; and it comprised, besides the province proper, the districts of Gavaudan, Vellai, Vivarez, Cevennes, and Foix. It contained the important cities of Toulouse, Carcassonne, Narbonne, Montpellier, Nismes, Cette, Viviers, Alby, and Foix. The south-western spurs of the Cevennes run across the province from the north-east to meet the first slopes of the Pyrenees. In spring and early summer no part of France possesses a more delightful climate than Languedoc, while Montpellier and its neighbourhood, in spite of the mistral, was up to recent times considered as an excellent retreat for consumptive patients. The Roman remains of Nismes, the lagoons and decayed towns of the Gulf of Lyons, the historical associations of Montpellier, the fine mediæval fortress of Carcassonne, the old towers and the *hôtels* da ville of Narbonne, the little known scenery of the eastern Pyrenees, with the castles of Foix and Tarascon, and Toulouse with its churches, fairs, floral games, and winding streets, make the country one of the most interesting in the

whole of France. Here may still be heard the soft accents of the *Langue d'Oc*, a language which has not, even yet, spoken its last word in the poetry of the world.

Gallia Narbonensis, one of the seventeen provinces into which the empire was divided at the death of Augustus, occupied nearly the same extent as the province of Languedoc. It was rich and flourishing, crowded with great towns, densely populated, with schools of rhetoric and poetry, theatres, amphitheatres, and splendid temples. From Narbo Martius came the rhetorician and poet Montanus, who was exiled by Tiberius to Majorca; from Nismes came Domitius Afer; and the emperors Carinus and Numerianus were also natives of Narbonne. The planting of Christianity, though doubtless the Greeks of Massilia heard of it before, was accomplished, according to tradition, by St Trophimus of Arles, St Paul of Beziers, and Saint Saturnin of Toulouse. It is characteristic of the country that its ecclesiastical historians lament even in the earliest ages a tendency to heresy among its people. At the break up of the Roman empire the Visigoths founded the kingdom of Toulouse (412 A.D.), and in a few years spread their conquests over Narbonensis, Novempopulana (Gascony), and Aquitania in France, as well as over the whole of the Spanish peninsula. They were driven out of France by Clovis, but retained "Septimania," the country of the seven cities—Narbonne, Carcassonne, Elne, Beziers, Maguelonne, Lodève, and Agde—that is, very nearly the area occupied later by the province of Languedoc. At the council of Narbonne (589) five sorts of people are mentioned as living in the province—the Visigoths, then the ruling race, Romans, Jews, of whom there were a great many, Syrians, and Greeks. It was not until the year 759, when Pippin took their chief town, Narbonne, that the Visigoths were forced across the Pyrenees, and the country became part of the great empire bequeathed by Pippin to his great son Charles. Septimania became part of the kingdom of Aquitaine, but was separated from it and constituted a special duchy in the year 817. Two or more invasions of the Saracens took place in the 9th century, and the Normans made a descent upon the coast in the year 856. Early in the 10th century we find this whole province in the power of the counts of Toulouse, and one of the great fiefs of the crown of France. While the Normans were ravaging the north of France and laying siege to Paris, the Saracens from the mouths of the Rhone were plundering and harrying the county of Toulouse. Neither in the south nor in the north of the country was there during the terrible 10th and 11th centuries any peace or comfort. A frightful pestilence desolated Aquitaine and Toulouse in the year 1000; and in 1032 a famine began which lasted for three years. Yet the court of Toulouse was already remarkable for its "luxury," as the ecclesiastical writers call it,—rather for its love of art and literature, combined with extravagance of dress and fashions. Constance, wife of King Robert, and daughter of the count of Toulouse, gave great offence to the monks by her following of gallant countrymen. They owed their tastes, not only to their Roman blood and the survival of their old love for rhetoric and poetry, but also to their intercourse with the Saracens, their neighbours and enemies, and their friends when they were not fighting. On the preaching of the crusade, no part of France responded with greater enthusiasm than the south. A hundred thousand men followed Raymond de Saint Gilles. A century later their own country was to be the scene of another crusade even more bloody than that against the Saracen.

The heresies which were the cause of so much bloodshed may, perhaps, be said to have begun with Peter de Bruys, who preached in Languedoc for twenty years, until he was silenced by the usual method. He denied

infant baptism, respect for churches, the worship of the cross, transubstantiation, and prayers for the dead. His follower, Henry the Deacon, most eloquent of preachers, denied a great deal more. Wherever he taught he left deserted churches and contempt for the clergy. Although Bernard himself was invited to lend his persuasive powers to restore the cause of the church, he succeeded for a time only. Toulouse, for instance, was brought back to orthodoxy, yet when the great preacher went away the citizens relapsed. Again, there were the poor men of Lyons, the followers of Peter Waldo, of whom there were many in Languedoc, and there were the Manichæans, under the name of Puritans, Paternes, or Populans. In Languedoc and Provence the ground was ready for the seed of heresy. The towns were wealthy and free, the people had been in continual intercourse with Saracens of Palestine and Moors in Spain; they had never entirely rid themselves of pagan customs; their poetry taught the joys of life rather than the fear of death, their restless inquiring minds prompted them to ask whether there were any other solution of the problem of life than that offered by the church. The whole province—the county of Toulouse, with its fiefs of Narbonne, Beziers, Foix, Montpellier, and Quercy—was in open and scornful secession. It seems incredible, but it is doubtless true, that the churches were universally deserted, sacraments denounced, and clergy despised. The history of the crusade, in the reign of Raymond VI, against the heretics of Languedoc contains every element of cruelty and horror. The count made haste to submit, but it was of no avail. Bishops, papal legates, and ecclesiastics of all ranks headed the vast armies which were gathered together against the freethinkers. All the cities, one after the other, the castles, and the strongholds of Languedoc were taken by the crusaders. Raymond was made to submit to the lowest abasement; the country was wasted; the people were destroyed by fire and sword. When all was over, when Raymond and Simon de Montfort were dead, and King Louis VIII. had led a vast army of conquest through the country, the council of Toulouse was held, in order to subject the people to total spiritual submission. They chose the method, which seems so easy but is so difficult, of universal espionage and delation. They succeeded in enforcing apparent submission; but the spirit of religious freedom lingered among the people, and yet survives, for nearly half the Protestants in France belong to the south. The pacification of Languedoc was completed by the annexation of the county to the crown of France. In 1229 Count Raymond VII. renounced his claim to seven provinces, and swore fealty to the king.

Languedoc had, for two centuries, no other history apart from that of France. The long war with the English affected the country little. The province, comparatively safe from war, continued to increase and prosper in wealth. When it begins again to have a history of its own, it appears to be the home of the most bigoted orthodoxy. The university of Toulouse burns a professor, Caturet, for supposed heresy, and exiles a scholar, Dolet, for daring to sympathize with him. At the east of the province, however, Rabelais, who carries with him an atmosphere of free thought, is lecturing and dissecting, and in the west of the province Gerard Roussel is already preaching the doctrines of a purer faith. In the wars of religion, the great recruiting ground of Coligny was in those southern provinces against which Simon de Montfort had led his crusade. The insurrection of the Camisards belongs to the history of Languedoc, but the struggle was confined to the north part of the province. The pacification by Villars and the duke of Berwick, the horrible cruelties practised upon the people, and the singular story of Cavalier are noticed elsewhere.

A special interest attaches to the history of two towns, at least, of Languedoc. Both Montpellier and Toulouse present very remarkable features of interest to the student of municipal histories. The literature of the country is the literature called after its neighbour *PROVENÇAL (q.v.)*. Probably no great future remains for the literature of a dialect slowly dying out, yet examples have not been wanting of late to prove that there is still vitality in the language of the people. (w. 22)

LANGUET, HUNER (1518-1581), diplomatist, and one of the boldest political writers of the 16th century, was born in 1518 at Viteaux, near Autun in Burgundy, where his father held a good official position. He early manifested an inclination for study, and his tastes were encouraged by able masters; at Poitiers he devoted himself not only to law but also to natural science, history, politics, and theology. On leaving that university, after a sojourn at Leipzig, where he became the friend of Camerarius, he visited Padua and Bologna, and saw many other parts of Italy. Having been introduced in the course of his Italian journey to the *Lozi Theologi* of Melancthon, he in 1549 set out for Wittenberg to make the acquaintance of that author, and thus originated a friendship which terminated only with the death of the latter in 1560. Between 1551 and 1557 Languet travelled extensively in Germany, Denmark, Sweden, Finland, and Lapland, and in 1559 he entered the diplomatic service of the elector of Saxony, where he remained until his death. During the greater part of this period he was employed chiefly in negotiations with France and in the interest of the Huguenots. He was present in Paris on St Bartholomew's Day (1572), and was the means of saving his friends Wechel the printer, and Duplessis-Mornay; but his efforts drew on him the attention of the mob, and he himself in turn became indebted for his life to the chancellor Morvilliers. From 1573 to 1576 his mission lay chiefly at the imperial court, here he gained the acquaintance and ultimately the close friendship of Sir Philip Sidney. About 1578 he went to Ghent on the invitation of John Casimir, whom he accompanied to England, and the rest of his days he spent chiefly in the Low Countries, watching the course of political events. There seems to be no ground, however, for the assertion that in 1577 he had resigned his connexion with the court of Saxony, and formally attached himself to the prince of Orange. Languet died at Antwerp on September 30, 1581.

His correspondence with Augustus of Saxony (three hundred and twenty-nine letters, from November 17, 1565 to September 8, 1581), and with Mordeisen, the chancellor of the duchy (one hundred and eleven letters, from November 1560 to the summer of 1565), were published by Ludovius at Halle in 1606 under the title *Arxana secreti X.P. Huberti Langueti Epistolæ politicae et historice ad Philip. Augustum* (twenty-six letters, from April 59, 1578 to October 28, 1580), appeared at Frankfurt in 1633, and have since been reprinted. *Langueti Epistolæ ad Joh. Camerarium, patrem et filium* (one hundred and eight letters) were published by L. Camerarius at Groningen in 1646. The *Historia Descriptio* of the siege and capture (1567) of Gênes appeared in 1685. The work by which Languet is best known is pseudonymous, and its authorship has not been undisputed. It is entitled *Pandectæ contra tyranniam, sive de principis in populum populique in principem legitima potestate*, Stephano Anno Bruto Cella auctore, and bears to have been published at Edinburgh in 1579. By Edinburgh is most probably to be understood Basel. A French translation appeared in 1581; the original has been frequently reprinted, most recently at Leipzig in 1840. The work, which discusses with much freedom various points connected with the then familiar doctrine of passive obedience, attracted much attention, but its author was very successful in concealing the somewhat dangerous secret of his identity. It has been ascribed to Beaumont, Camerlun, and Duplessis-Mornay, by divers writers on various grounds—to the last-named on the very respectable authority of Grotius. The grounds on which Bayle (who has been followed almost unanimously by later writers) assigned it to Languet will be found in the form of a supplement to the *Dictionnaire*. The *Apologie ou défense de Bruto Cellæ, Prince d'Orange, contre le bon et*

'*celit du roi d'Espagne* (Antwerp, 1681) is sometimes attributed to Auguet. There seems little doubt, however, that it was really the work of the prince himself, with the help either of Pierre de Villiers (see Motley, *Rise of Dutch Republic*) or of Languet (Green in Pinaster, *Archives*).

LANNES, JEAN (1769-1809), marshal of France, was born at Lectoure, 11th April 1769. He was the son of a very stables keeper, and was himself in early life apprenticed to a dyer. He had had but little education, but notwithstanding this his great strength and proficiency in all manly sports caused him in 1792 to be elected sergeant-major of this battalion of volunteers of Gers, which he had joined on the breaking out of the war between Spain and the French republic. He served through the campaigns in the Pyrenees in 1793 and 1794, and in the latter year was elected chef de brigade. However, in 1796, on the reform of the army introduced by the Thermidorians, he was dismissed from his rank. Not discouraged by this check, he re-enlisted as a simple volunteer in the army of Italy. In the famous campaign of 1796 he again fought his way up to high rank, being eventually made once more chef de brigade by Bonaparte. He was distinguished in every battle, and was wounded at Arolo. He was chosen by Bonaparte to accompany him to Egypt as general of one of Kleber's brigades, in which capacity he greatly distinguished himself, especially on the retreat from Syria. He went with Bonaparte to France, assisted at the 18th Brumaire, and was appointed general of division, and commandant of his consular guard. He commanded the advanced guard on the crossing of the Alps in 1800, was instrumental in winning the battle of Montebello, from which he afterwards took his title, and bore the brunt of the battle of Marengo. In 1801 Napoleon tried his favourite general as a diplomatist, and sent him as ambassador to Portugal. Opinions differ as to his merits in this capacity, but it may be presumed that Napoleon did not believe in them, as he never made such use of him again. On the establishment of the empire he was created a marshal of France, and commanded once more the advanced guard of a great French army in the campaign of Austerlitz. At Austerlitz he commanded the left, at Jena the centre, and at Friedland the centre of the French army, showing himself a general of division of the greatest merit, carrying out the orders given him to the letter, and never thinking them impossible. He was now to be tried as a commander-in-chief, for Napoleon took him to Spain in 1808, and gave him a corps d'armée, with which he won a victory over Castaños on November 22. In January 1809 he was sent to attempt the capture of Saragossa, and by February 21 was in possession of the place. Napoleon then created him Duc de Montebello, and once more, for his last time, gave him the command of the advanced guard of an army of invasion. At Aspern he was ordered with two divisions to cut the Austrian army under the archduke Charles in half; he succeeded entirely, though under a heavy fire, but finding himself unsupported by Napoleon, who had been thrown into confusion by the news that his bridges over the Danube had been broken, he had to retreat. During the retreat he exposed himself as usual to the hottest fire, and received a mortal wound as he was being carried from the field to die at Vienna. He is said to have met and reproached his old general for his ambition; but this, to say the least, is a contested statement. Napoleon said of him that "he had found him a pigmy, and made him a giant"; and there can be no doubt of his marvellous ability on the field, and his extraordinary courage. His eldest son was made a peer of France by Louis XVIII.

A *Vie militaire de J. Lannes* was published in 1809 by René Berin, but details can be found in all the military histories of the time.

LA NOUE, FRANÇOIS DE (1531-1591), surnamed Bras-de-Fer, one of the gallant Huguenot captains of the 16th century, was born near Nantes in 1531, of an honourable and ancient Breton family. His first exploit was the capture of Orleans at the head of only fifteen cavaliers in 1567, during the second Huguenot war. At the battles of Jarnac in March 1569 and of Moncontour in the following October, La Noue was taken prisoner, but he was exchanged on the latter occasion in time to resume the governorship of Poitou, and inflict a signal defeat on the royalist troops before Rochefort. At the siege of Fontenay (1570) his left arm was shattered by a bullet, and the iron limb that replaced it won him from his soldiers the sobriquet of Iron-Arm. When peace was made in France in the same year, La Noue carried his sword against the Spaniards in the Netherlands, but was taken at the recapture of Mons by the Spanish in 1572. Permitted to return to France, he was commissioned by Charles IX. to attempt to reconcile the inhabitants of La Rochelle, the great stronghold of the Huguenots, to the king. But the Rochellais were too much alarmed by the recent massacre of St Bartholomew to come to any terms; and La Noue, perceiving that war was imminent, and knowing that his post was on the Huguenot side, gave up his royal commission, and from 1574 till 1578 acted as general of La Rochelle. When peace was again concluded, La Noue once more went to aid the Protestant estates of the Netherlands. Holding a high rank in their army, he took several towns and captured Count Egmont in 1580; but a few weeks afterwards his himself fell into the hands of the Spaniards. Thrust into a loathsome prison at Lumburg, La Noue, the admiration of all, of whatever faith, for his gallantry, honour, and purity of character, was kept confined for five years by a powerful nation, whose reluctance to set him free is one of the sincerest tributes to his reputation. At length, in June 1585, La Noue was exchanged for Egmont and other prisoners of consideration, while a heavy ransom and a pledge not to bear arms against his Catholic majesty were also exacted from him. Till 1589 La Noue took no part in public matters, but in that year he joined Henry of Navarre and Henry III. against the League. He was present at both sieges of Paris, and at several of the chief battles; but at the siege of Lamballe in Brittany he received the wound of which he died some days later at Moncontour, August 4, 1591.

Bontevoghe exaggerates in saying that La Noue was as famous by his pen as by his sword. What writings he has left are of value enough, but it is not by them that he is remembered. He was the author of *Discours Politiques et Militaires*, 1587, *Déclaration pour prise d'armes et la défense de Sedan et Janets*, 1588, *Observations sur l'histoire de Guicciardini*, 2 vols. 1593, and notes on *Pittacus's Laws*, which have not been published. His *Correspondance* was published in 1854. See *La Vie de François, seigneur de La Noue*, by Moysse Amrault, Leyden, 1661; Brantôme's *Vies des Capitaines Français*, C. Vivon's *Les Héros de la Réforme: P. de La Noue* (1878); and Haug, *La France Protestante*.

LANSLOWNE, WILLIAM PETTY FITZMAURICE, FIRST MARQUIS OF (1737-1805), better known as a statesman while earl of Shelburne, was born at Dublin, May 20, 1737. He was a descendant of the lords of Kerry, and his grandfather, who was created earl of Kerry, married a daughter of Sir William Petty. On the death without issue of Sir William Petty's son, the first earl of Shelburne, the estates passed to his nephew John Fitzmaurice (afterwards advanced to the earldom of Shelburne), the father of the subject of the present notice. The latter spent his childhood "in the remotest parts of the south of Ireland," and, according to his own account, when at the age of sixteen he entered Christ Church, Oxford, he had both "everything to learn and everything to unlearn." From a tutor whom he describes as "narrow-minded" he received advantageous guidance in his studies, but he attributes

his improvement in manners and in knowledge of the world chiefly to the fact, that, as was his "fate through life," he fell in "with clever but unpopular connexions." Shortly after leaving the university he served as an officer in Wolfe's regiment during the Seven Years' War, and so distinguished himself at Minden and Kloster-Kampen that he was raised to the rank of colonel and appointed aide-de-camp to the king. Being thus brought into near communication with Lord Bute, he was in 1761 employed by that nobleman to negotiate for the support of Charles Fox. For a few months in the same year he sat in the House of Commons as member of Wycombe, until he succeeded his father as earl of Shelburne in the Irish peerage, and Baron Wycombe in the peerage of Great Britain. Though he declined to take office under Bute he undertook negotiations to induce Fox to gain the consent of the Commons to the peace of 1763. Fox affirmed that he had been duped by the terms offered, and, although Shelburne always asserted that he had acted in thorough good faith, Bute spoke of the affair as a "pious fraud." Shelburne joined the Greenvile ministry in 1763 as president of the Board of Trade, but, failing in his efforts to replace Pitt in the cabinet, he in a few months resigned office. Having moreover on account of his support of Pitt on the question of Wilke's expulsion from the House of Commons incurred the serious displeasure of the king, he retired for a time to his estate. After Pitt's return to power in 1766 he became secretary of state, but during Pitt's illness his conciliatory policy towards America was completely thwarted by his colleagues and the king, and in 1768 he was dismissed from office. In 1782 he consented to take office under the marquis of Rockingham on condition that the king would agree to recognize the United States, and on the death of Lord Rockingham in the same year, he became premier; but the secession of Fox and his supporters led to the famous coalition of Fox with North, which caused his resignation in the following February, his fall being perhaps hastened by his proposed plans for the reform of the public service. He had also in contemplation a bill to promote free commercial intercourse between England and the United States. When Pitt acceded to office in 1784, Shelburne, instead of receiving a place in the cabinet, was created marquis of Lansdowne. Though giving a general support to the policy of Pitt, he from this time ceased to take an active part in public affairs. He died May 7, 1805.

During his lifetime the marquis of Lansdowne was blamed for insincerity and duplicity, but the accusations came chiefly from those who were dissatisfied with his preference of principles to party, and it is beyond doubt that, if he had had a more unscrupulous regard to his personal ambition, his career as a statesman would have had more outward success. His autobiography indicates that he was cynical in his estimates of character, but no statesman of his time possessed more enlightened political views, while his friendship with those of his contemporaries eminent in science and literature must be allowed considerable weight in qualifying our estimate of the moral defects with which he has been credited. See Fitzmaurice, *Life of William, Earl of Shelburne*, 3 vols., London, 1876-78.

LANSING, a city in Ingham county, Michigan, U.S., and capital of the State, is situated at the confluence of the Grand and Cedar rivers, 85 miles W.N.W. of Detroit. In 1847, when it was made the seat of government, forests covered the site. The city has broad streets, arranged in the regular rectangular system; and seven iron and three wooden bridges connect the parts of the city, which lies on both sides of the rivers above mentioned. Lansing is the seat of the State reform school, the school for the blind, and the State agricultural college. The last-named,

opened in 1857, received 240,000 acres granted by Congress for the endowment of a college of agriculture and the mechanical arts, and its income is derived from the interest of the price of part of the land, and from an annual grant from the State legislature. In 1880-81 it had a faculty of 23 members and 221 students. A graded system of public schools and a State library of 40,000 volumes are among the other educational resources of the city. Its most conspicuous building is the new State capitol, erected at a cost of one and a half million dollars. The leading manufacture is of agricultural implements, but there are extensive manufactories of carriages, waggons, wheelbarrows, and steam-engines, and four large flouring-mills. Good water-power is afforded by the Grand river, and four lines of railway offer ample shipping facilities. The city was incorporated in 1859, and in 1880 had a population of 8317.

LANSINGBURGH, a village in Rensselaer county, New York, U.S., is situated on the east bank of the Hudson, close to Troy, and nearly opposite Waterford, to which a bridge extends. The village was organized in 1774. Its staple product is brushes, known all over the States; but oil-cloth and crackers are also made. The population in 1880 was 7437.

LANTARA, SIMON MATHURIN (1729-1778), French landscape painter, was born at Onzy, 24th March 1729. His father was a weaver, and he himself began life as a herdsboy; but, having attracted the notice of M. Gille de Reumont, a son of his master, he was taken by him to Paris, and placed under a painter at Versailles. Endowed with great facility and real talent, his powers found ready recognition; he might have amassed fortune and earned distinction, but he could not divest himself of the habits acquired in early childhood. He found the constraint of a regular life and the society of educated people unbearably tiresome; he painted to please himself, and as long as the proceeds of the last sale lasted lived careless of the future in the company of obscure workmen with whom he had made friends. Rich amateurs more than once attracted him to their houses, only to find that in ease and high living Lantara could produce nothing. Fatal sickness came upon him when in extreme indigence; he entered the hospital of La Charité—in which he had previously been the object of the kindest cares—on the morning of 22d December 1778, and six hours after he was dead. His works, now much prized, are not numerous; the Louvre has one landscape, Morning, signed and dated 1761. As he was not a member of the Academy, his pictures were not admitted to its exhibitions, and notices of his works by his contemporaries are rare. Bernard, Joseph Vernet, and others are said to have added figures to his landscapes and sea-pieces. Engravings after Lantara will be found in the works of Lebas, Piquenot, Durek, Mouchy, and others. In 1809 a comedy called *Lantara, or the Painter in the Pothouse*, was brought out at the Vaudeville with great success.

See K. Bellier de la Chavignerie, *Recherches sur le peintre Lantara*, Paris, 1852.

LANTERN-FLY, a name applied to certain insects belonging to the Homopterous division of the order Hemiptera, which may be broadly placed in the genus *Fulgora*, although this is now subdivided into many genera. They are mostly large insects, and gaily coloured, remarkable for the forehead being produced into the semblance of a snout or muzzle (often upturned at the tip), the so-called "lantern." This snout is hollow, and is merely an inflated production of the head. Much interest, as well as mystery, has surrounded these insects, originating in a statement by Madame Merian in her work on the insects of Surinam (*Metamorphosis insectorum Surinamensium*, &c.), of which the first edition appears to have been published in 1705,

but which subsequently passed through many editions with varying titles and in several languages. Madame Merian stated that the common South American species, now known as *Fulgura lateraria*, L., was highly luminous at night, so much so that she was enabled to read by the light of one only, and that when several were confined together the interior of the box appeared all ablaze. No one doubted these statements, and the illustrious Linnaeus used the words "Promittens fronte noctu lucem vivacissimam spargit" in diagnosing the insect in his *Systena Naturæ*. Moreover, it was believed that, because one species had been asserted to be luminous, others allied thereto must possess the same power; the specific names used by Linnaeus, such as *candelaria*, *phosphorea*, *noctivnda*, *lucenaria*, and *flammea*, may be adduced as instances. Of these one only, the *F. candelaria* of China, has become (with the original *lateraria*) a subject of controversy, for it also was asserted to be luminous. As time wore on many intelligent naturalists and other travellers visited both South America and China, and they concluded that the light must be produced only under very exceptional conditions, or that the original statement was an error, for they could not detect any luminosity, nor, as a rule, was such a property believed in by the natives of the regions. Quite recently many naturalists of undoubted authority have resided for years in the districts where these insects occur without having personally detected luminosity (though directly in search of it), and without obtaining any indications of the existence of such a belief in the minds of the natives. On the other hand, there have been a few travellers who have professed to be able to confirm Madame Merian's statements, both from personal observation and from information derived from native sources. Possibly the last of these was within the last twenty years, and his assertion concerned *F. candelaria*, and upon his statement an entomologist of repute, lately deceased, maintained to the last his belief in the luminous powers. With him all faith in this direction has probably passed away. It is not for us to attempt to define the reasons for Madame Merian's positive and circumstantial statements. The preponderance of negative testimony is so crushingly great that *Fulgura* may be regarded as eliminated from the category of luminous insects.

LANTHANUM. It will be convenient to notice under this heading the group of closely allied metals—**LANTHANUM, CERIUM, and DIDYMIUM.**

In an abandoned copper mine at Riddarhyttan, Westmanland, in Sweden, there occurs a heavy compact mineral, which, though pretty abundant there, is hardly met with anywhere else. This mineral was long mistaken for tungsten (syn. scheelite), until Klaproth of Berlin in 1803 found in it a peculiar earth, which he called *ochroite earth*, as it becomes yellow when heated in air. About the same time Berzelius and Hisinger made the same discovery; and, (rightly) presuming the new earth to be an oxide of a new metal, they called the latter *cerium* (after the planet Ceres, the then latest discovery in astronomy) and the mineral *cerite*, which names have been retained to this day. Only the name "cerium" now has a more specific meaning, it having been shown by Mosander (in 1839-41) that Berzelius's cerium is a mixture of three metallic radicles, namely, cerium proper, lanthanum (from *λανθάνειν*, "to be concealed"), and didymium (from *δίδυμος*, "twin"). These metals are very closely related to one another in their chemical character, and may be conveniently treated together. The extraction from cerite, of the oxide group, offers no difficulty. According to Margnac (*Ann. Chim. Phys.* [3], vol. xxvii.), the powdered mineral is made into a thick paste with oil of vitriol, and the reaction which sets

in allowed to accomplish itself. The remaining dry white powder is placed in a crucible, and kept there for a long time at a temperature below redness, but sufficient to chase away the bulk of the free sulphuric acid. The residue is added in small instalments to a quantity of cold water, and the gangue (ferruginous silica) filtered off. The solution is boiled, when the greater part of the *cerite-oxides* comes down in the form of sulphate almost free from foreign oxides. The sulphates can be purified by redissolving them in the least quantity of water at 5° to 6° C., filtering, and reprecipitating by boiling. What remains in the mother-liquors is recovered by precipitation with sulphate of potash (which must be added as a solid and in sufficient quantity to saturate the solution) as an alum-like double sulphate. The purified sulphates are dissolved in cold water, precipitated as oxalates by means of oxalate of ammonia, and the washed oxalates ignited, when the pure cerite-oxide mixture remains. The separation of the three oxides from one another offers very great difficulties. Comparatively easy is the extraction of approximately pure oxide of cerium—by Berzelius's method. Dissolve the mixed oxide (which must be free of sulphate if the method is to succeed) in nitric acid, evaporate to dryness, ignite the residue, and treat it with nitric acid diluted with one hundred times its weight of water. Only lanthanum and didymium dissolve, impure binoxide of cerium (Ce_2O_3) remaining, which can be further purified by treatment with more concentrated nitric acid, which, however, besides the lanthanum and didymium, dissolves a good deal of the cerium itself. This method (like any of the rest) is founded upon the fact that salts of sesquioxide of cerium (Ce_2O_3) are readily oxidized into salts of the feebly basic binoxide CeO_2 under circumstances which effect no higher oxidation in La_2O_3 or Di_2O_3 .

For the preparation of the oxides of lanthanum and didymium we may utilize the nitric mother-liquors obtained in the extraction of cerium-oxide. These are evaporated to dryness, the residue is ignited, and treated with very dilute nitric acid, which dissolves the lanthanum and didymium with only little cerium (Mosander, Margnac). A more complete elimination of the cerium is effected (Bunsen) by converting the nitrates into sulphates (by evaporation with sulphuric acid to dryness, and igniting the residuum), dissolving these in sulphuric acid water, and boiling with powdered magnesite ($MgCO_3$). From the filtrate the lanthanum and didymium are precipitated (after acidulation by muriatic) with oxalic acid, and the oxalates filtered off, washed, and ignited. By repeating the magnesia and oxalic acid process two or three times, the oxides are obtained cerium-free. They are then made into anhydrous, neutral sulphates; these are dissolved in a minimum of water at 0° to 1° C., and the solution is heated to 30° to 35° C., when lanthanum sulphate chiefly separates out in small crystals, which are filtered off with the help of a filter-pump. A relatively lanthanum-free didymium sulphate remains dissolved (Mosander).

The metals were known only in a powdery form up to 1876, when Hillebrand and Norton succeeded in preparing them in a compact form by the electrolysis of the fused chlorides. The three metals are very similar to one another; they are steel-grey ductile true metals, melting at a somewhat lower temperature than silver. Specific gravities range from 6.1 to 6.6. They are more readily inflammable than magnesium.

The atomic weights of the three elements are now (1882) quoted as Ce = 141, La = 138, Di = 147.

Oxides and Salts.—Cerium has long been known to form two oxides, namely, a lower ("cerous") oxide, which is a pretty strong, and a higher ("ceric") oxide, which is a feeble base. 16 ("O") parts of oxygen are combined, in the former with 62 ("F") parts, in the latter with 28 parts of metal. Formerly Z was looked upon as the atomic weight, and the oxides formulated as FO and F_2O_2 respec-

tively. But Mendeleev on theoretical grounds insisted that the lower oxide must be looked upon as a sesquioxide, Ce_2O_3 , while $\text{Ce} = 3\text{Pr} = \text{Ce} = 3\text{Pr}$ and the higher (necessarily) as a monoxide, Ce_2O_3 , or rather CeO_2 . And he asserted the same in regard to the reputed monoxides of lanthanum and dysprosium. These remarks were little heeded even by the specialists until Hillebrand (partly in conjunction with Norton) succeeded in obtaining the three metals as such, and in a truly metallic condition, which admitted of an exact determination of the specific heats. The specific heats were found to be— for Ce 0.4479, for La 0.4485, for Dy 0.4563, and these numbers must be multiplied with Mendeleev's atomic weight to produce "atomic heats" (6.6; 6.23; 6.4), approximating to values obtaining for other metals of established atomic weight. Hence Mendeleev was right.

Cerous oxide, Ce_2O_3 , is obtained by heating the oxalate in an atmosphere of hydrogen, as a bluish-grey powder. The higher oxide CeO_2 is obtained when any certain salt of a volatilized (e.g., nitric) is ignited in air, it is a white powder, which when cold has only a slight touch of yellow in it, but at high temperatures assumes a deep orange-red color. Cerous chloride, CeCl_3 , is obtained by heating the metal, or a mixture of nitric oxide and charcoal, in dry chlorine gas, as a yellowish-white substance, uniting with water into indistinct crystals $\text{CeCl}_3 \cdot 6\text{H}_2\text{O}$. The cerous sulphate, $\text{Ce}_2(\text{SO}_4)_3$, separates out when its solution is heated. It is soluble in 6 parts of cold, and in about 60 of hot water, and forms a difficultly soluble double salt with sulphate of potash. To obtain the cerous sulphate, when the dioxide is treated with cold concentrated sulphuric acid, and the solution formed by addition of water allowed to evaporate, the salt $\text{Ce}_2(\text{SO}_4)_3 \cdot 6\text{H}_2\text{O}$ or $2\text{Ce}_2\text{O}_3 + 25\text{H}_2\text{O}$ separates out in red crystals looking like leucocrate of potash. The mother-liquor yields yellow crystals of $-\text{Ce}(\text{SO}_4)_3 \cdot 4\text{H}_2\text{O}$.

The most characteristic test for cerium salts is that the colourless cerous solutions, on addition of hypochlorite of soda, give a red precipitate of a ceric chloride.

Dysprosium (Dy_2O_3) solutions have an astringent astringent taste and a rose-red or violet color. But their most characteristic property is their beautiful absorption-spectrum, which comes out distinctly with as little as half an inch deep of a solution containing 1/10th of a per cent of the oxide (Gladstone). Lanthanum (La_2O_3) solutions have a similar taste to those of dysprosium salts. They are colorless. The chloride when volatilized between the poles of an induction coil yields a highly characteristic rich line-spectrum, by means of which the least traces of the metal can be detected (Bunsen).

Of higher oxides of cerium or dysprosium we had hitherto only indications, but quite lately Dr. Brauner (*Chem. News* for 1881, December 53), in Roscoe's laboratory, succeeded in preparing a definite pentoxide, Dy_2O_5 , of dysprosium, and also a hydrate of it, $\text{Dy}_2\text{O}_5 \cdot \text{H}_2\text{O}$.

Sources.—Copper, though the most abundant, is not the only native source of cerium, lanthanum, and dysprosium. A. Cosca has found traces of the metals in the ashes of numerous plants, and even in the human body. But it is more important to state that there are a number of rare minerals, of which the chief are known by the names of gadolinite, euxenite, samarskite, which, along with more or less of cerite-metals, contain other rarer earth-metals similar to these. Until lately the handbooks of chemistry quoted only three such rarer members of the family under the names of yttrium, erbium, and terbium, but these reputed individual elements have, during the last few years, been searchingly analyzed by Mangnès, M. Delafontaine, L. F. Nilson, P. T. Clève, J. L. Smith, and others, and under their hands resolved themselves into about a dozen separate elements. The rare earth-metals in fact had far to multiply like the little planets in astronomy; and, although in chemistry no firmly established fact can justly be called unimportant, the minor rare earths, in the meantime, are of no general interest, even to the general chemist.

See V. L. L. *Disquisitiones de Chimia*, 1874, Roscoe and Schodden, *Handbook of Chemistry*, 1870, M. Delafontaine, *Annales de Chimie*, 1868-69, *Progresses des Sciences physiques et naturelles*, *Revue des Sciences*, 1868-69, *Progresses des Sciences*, 1871; *Journal of Practical Chemistry*, 1868-69, *Zeitschrift für Chemie*, 1869. The *Handbook of Chemistry* is the most reliable source of information.

LANZI, LUIGI (1732-1810), a writer on Etruscan antiquities and on the history of Italian painting, was born in 1732, and educated as a priest. In 1775 he was appointed keeper of the galleries of Florence, from which time his attention seems to have been divided between the study of Italian painting and the study of Etruscan antiquities and language. In the one field his labours are represented by his *Storia Pittorica della Italia*, the first portion of which, containing the Florentine, Siennese, Roman, and Neapolitan schools, appeared in 1792, the rest in 1796. The work is translated by Roscoe. In archaeology his great achievement was the work entitled *Saggio di lingua Etrusca*, 1789,

followed by *Saggio delle lingue Ital. Antiche*, 1806. In his memoir on the so-called Etruscan vase (*Dei vasi antichi dipinti volgarmente chiamati Etruschi*, 1806) Lanzi correctly perceived their Greek origin and characters. What was true of the antiquities would be true also, he argued, of the Etruscan language, and the object of the *Saggio di lingua Etrusca* was to prove that this language must be related to that of the neighbouring peoples—Romans, Umbrians, Oscans, and Greeks. It is admitted that he was wanting in critical method after a certain point, though at the same time much of the impulse he gave to study arose from his general method of inquiry. It is a sign of the recognition he received that he was allied with E. Q. Visconti in his great but never accomplished plan of illustrating antiquity altogether from existing literature and monuments. His notices of ancient sculpture and its various styles appeared as an appendix to the *Saggio di lingua Etrusca*, and arose out of his careful and minute study of the treasures then added to the Florentine collection from the Villa Medici. The abuse he has often met with from modern writers in the Etruscan language led Corssen (*Sprache der Etrusker*, 1. p. vi.) to protest in the name of his real services to philology and archaeology. Among his latest productions may be mentioned his edition of Hesiod's *Works and Days*, with valuable notes, and a translation in *terza rima*. It had been begun as far back as 1785, but was ceased and completed in 1808. The list of his works closes with his *Opere Sacre*, a series of treatises on spiritual subjects. Lanzi died of apoplexy, March 30, 1810, in the seventy-eighth year of his age. He was buried in the church of the Santa Croce at Florence, by the side of Michelangelo.

LAOCOON, in Greek legend, was a brother of Anchises, and had been a priest of Apollo, but having married against the will of the god he and the two sons of this marriage were attacked by serpents while preparing to sacrifice a bull at the altar of Poseidon, in whose service Laocoon was then acting as priest. An additional motive for his punishment consisted in his having warned the Trojans against the wooden horse left by the Greeks. But, whatever his crime may have been, the punishment stands out even among the tragedies of Greek legend as marked by its horror—particularly so as it comes to us in Virgil (*Aeneid*, ii. 199 *sq.*), and as it is represented in the marble group in the Vatican (see Plate V). In the oldest existing version of the legend—that of Arcturus of Miletus, which has so far been preserved in the excerpts of Proclus—the calamity is lessened by the fact that only one of the two sons is killed; and this, as has been pointed out (*Arch. Zeitung*, 1879, p. 167), agrees with the interpretation which Goethe in his *Propylæen* had put on the marble group without reference to the literary tradition. He says: "The younger son struggles and is powerless, and is alarmed; the father struggles ineffectively, indeed his efforts only increase the opposition, the elder son is least of all injured, he feels neither anguish nor pain, but he is horrified at what he sees happening to his father, and he screams while he pushes the coils of the serpent off from his legs. He is thus an observer, witness, and participant in the incident, and the work is then complete." Again, "the gradation of the incident is this: the father has become powerless among the coils of the serpent; the younger son has still strength for resistance but is wounded; the elder has a prospect of escape." Lessing, on the other hand, maintained the view that the marble group illustrated the version of the legend given by Virgil, with such differences as were necessary from the different limits of representation imposed on the arts of sculpture and of poetry. These limits required a new definition, and this he undertook in his still famous work, *Laocoon* (see the edition of Hugo Blümner, Berlin,

W. & T. Gillman, Phil. Acad. 1861. 1/2 in.

Long. 1/2 in. 1/2 in. 1/2 in.

1870, in which the subsequent criticism is collected). The marble group in the Vatican was found in 1506 near the baths of Titus, and there is no question of its being the same which Pliny (*Nat. Hist.* xxxv. c. 5) speaks of as in the palace of Titus, and as the work of three Rhodian sculptors Agesander, Polydorus, and Athenodorus. They made it, he says, *de consensu sententia*, which, according to the highest Latin authorities, must refer not to a standing imperial council but to a council selected *ad hoc*. This suits the theory of the sculpture being a work of the time of Titus—not an original conception of that time, but a variant of a conception more or less familiar to Greek art since the time of Alexander, such as may be seen in marble reliefs, on gems, in a painting found at Pompeii (see Blumner's *Laocoon*, pls. 3, 3), and on a terra cotta Etruscan urn in the British Museum. The names of Agesander and Athenodorus have been found repeatedly on bases of sculptures in Italy, and the date of the writing is that of the time of Titus. Still the opinion is very generally held that the Vatican group is altogether a work of the Rhodian school during its supremacy after the death of Alexander, and that the artists named by Pliny had lived then, and were apparently a father and two sons, for which reason Pliny may have thought it necessary to add *de consensu sententia*, in the sense of "according to the decision of their combined thoughts," to prevent any one supposing that the artists had each made one of the figures, selecting them possibly in accordance with their own relationship to each other, the father taking Laocoon, and the sons taking respectively the sons of Laocoon. As yet, however, the characteristics of the Rhodian school are not sufficiently known for a final settlement of this long standing question. In Plate V. the right arm of Laocoon with the coils of the serpent which he holds up is restored, as is also the right arm of the younger son. (A. S. M.)

LAODICEA (Greek *Λαοδικέα*) is the name of at least eight cities, founded or renovated in the later Hellenic period. Most of them were founded by the Seleucid kings of Syria. Seleucus, founder of the dynasty, is said by Appian to have named five cities after his mother Laodice. Many other women of the family bore the same name, which also passed by marriage into the family of the Pontic kings. The victories of Alexander introduced Greek civilization over Asia; the organizing and city-building energy of his successors established and consolidated it. They either founded new cities in favourable situations or reorganized native cities after the Greek model: thus over the immense realm of the Seleucids from the *Ægean Sea* to the borders of India we find numberless cities called Seleucia, Laodicea, &c. So long as Greek civilization held its ground, these were the great commercial and social centres of the country. We find a *Laodicea ad Lycum* in the Meander valley, on the borders of Phrygia, Caria, and Lydia; another surnamed *Combusta* on the borders of Phrygia, Lycaonia, and Pisidia; a third in Pontus; a fourth, *ad mare*, on the coast of Syria; a fifth, *ad Libanum*, beside the Lebanon mountains; and three others in the far east—Media, Persia, and the lower Tigris valley. In the latter countries Greek civilization was overwhelmed in Orientalism after a century or two, and the last three cities disappeared; the other five continued great throughout the Greek and Roman period, and the second, third, and fourth retain to the present day the ancient name under the pronunciation *Ladik*, *Ladikiyeh*, or *Latakia* (see LATAKIA).

Laodicea ad Lycum was founded probably by Antiochus II. Theos (261-46 B.C.), and named after his wife Laodice. Its site, called by the Turks *Eski Hisar*, "the old castle," is now solitary and deserted, but it retains an undying

interest as one of the oldest homes of Christianity and the seat of one of the seven churches of the Apocalypse. Pliny tells us (v. 29) that the town was called in older times *Diospolis* and *Rhoas*, but it is certain that at an early period *Colossæ*, a few miles to the east, and *Hierapolis*, six miles to the north, were the great cities of the neighbourhood, and that *Laodicea* was a place of no importance till the Seleucid foundation (Str., p. 578). A favourable site was found on some low hills of alluvial formation, about 2 miles south of the river Lycus (Churuk Su), and 9 miles east of the confluence of the Lycus and Meander. Smaller rivers of the neighbourhood are the *Asopus*, *Caprus*, and *Cadmus*, the last named after the lofty range of Mount *Cadmus* (*Baba Daghi*), which overhangs the Meander valley on the south. The great trade route from the Euphrates and the interior passed through *Apamea* to *Laodicea*. There it forked, one branch going straight down the Meander valley to *Magnesia* and thence north to *Ephesus*, a distance of about 90 miles, and the other branch crossing the mountains by an easy pass to *Philadelphia* and the *Hermus* valley, *Sardis*, *Thyatira*, and at last *Pergamus*. St Paul (Col. iv. 16) alludes to the situation of *Laodicea* beside *Colossæ* and *Hierapolis*, and the order in which the last five churches of the Apocalypse are enumerated (Rev. i. 11) is explained by their position on the road just described. Placed in this important situation, in the centre of a very fertile district, *Laodicea* became a rich city. It was famous for its money transactions (Cic., *Ad Fam.*, ii. 17, iii. 5), and for the beautiful soft wool grown by the sheep of the country (Str., 278). Both points are referred to in the message to the church (Rev. ii. 17, 18).

Little is known of the history of the town. It suffered greatly from a siege in the Mithridatic war, but soon recovered its prosperity under the Roman empire. The *Zeus* of *Laodicea*, with the curious epithet *Æzus* or *Æzias*, is a frequent symbol on the city coins, and is one of the widest-known deities of western Asia Minor. He is represented standing, holding in the extended right hand an eagle, in the left a spear, the *hasta pueri*. Not far from the city was the temple of *Men Karou*, with a great medical school, while *Laodicea* itself produced some famous *Stoic* philosophers, and gave origin to the royal family of *Ptolemaion* and *Zenon*, whose curious history has been illustrated in recent times (Waddington, *Mélanges de Numism.*, ser. ii.; Mommsen, *Epist. Epigraphic.*, i. and ii.; Bayet, *Mémoires de la Société Latine*, chap. v.). The coinage of *Laodicea* continues in a rich unbroken series to the time of the emperor *Diocletian*. Under the Byzantine rule its greatness remained, but finally the city fell into decay in the frontier wars with the Turkish invaders. Its ruins are of wide extent, but not of great beauty or interest; there is no doubt, however, that much has been buried beneath the surface by the frequent earthquakes to which the district is exposed (Str., 580; Tac., *Ann.*, xiv. 27). For an account of the ruins see the works of *Leake*, *Hamilton*, *Arundel*, *Texier*, &c., and especially the beautiful drawings of *Cockerell* in the *Antiquities of Ionia*, vol. iii. pl. 47-61.

LAON, capital of the département of Aisne, France, is situated 87 miles N.E. of Paris, on an isolated and singularly buttressed hill, which rises some 330 feet above the surrounding plain and the little river of Ardon, which flows into the Lette, a tributary of the Oise. From the railway station, which is situated in the plain to the north, a straight staircase of several hundred steps leads up to the gate of the town, but all the roads connecting Laon with the surrounding district are cut in zigzags on the steep slopes, which are crowned by the old and partly ruinous ramparts. At the eastern extremity of the hill rises the citadel; at the other end is a parade-ground, and on the south stands the ancient abbey of St Vincent. Between the latter and the town is the *Curve St Vincent*, the slopes of which are covered with trees, vegetable gardens, and vineyards. From the promenade along the line of the ramparts there is an extensive view northward to beyond St Quentin, westward to the forest of St Gobain, and southward over the wooded hills of the *Laonnais* and *Soumme*.

The cathedral of Laos is one of the most important creations of the art of the 12th and 13th centuries. It took the place of the old cathedral, burned at the beginning of the communal struggles mentioned below. The building is cruciform, and the choir, instead of being apsidal, terminates in a straight wall. Each of the three *chapelles* formerly had two towers with spires, and there was also a great central tower. Of these only four remain, and, being without spires, they give the building the aspect of a strong castle. The west front ranks next to that of Notre Dame at Paris in purity. The chapter house and the cloister contain beautiful specimens of the architecture of the beginning of the 13th century. The old episcopal palace, contiguous to the cathedral, is now used as a court-house. The front, flanked by turrets, is pierced by great pointed windows. There is also a Gothic cloister and an old chapel of two stories, of a date anterior to the cathedral. The church of St. Martin dates from the middle of the 12th century. The old abbey buildings of the same foundation are now used as the hospital. The old 12th century chapel of the Templars now forms part of the establishment of the Brothers of Christian Doctrine. The church of the suburb of Vaux near the railway station dates from the 11th century. Numerous cellars of two or three stories have taken the place of the old quarries in the hill-sides. The old ramparts have been demolished, but the 13th century gates of Ardon, Royer, and Chenailles have been preserved. The Société Académique de Laos has collected in its museum of arts and antiquities many archaeological treasures, among others a striking Roman mosaic of the 2d century, representing Orpheus charming the animals by his lyre, and some Roman ewers, noticeable for quality of metal and purity of form. The communal library contains 30,000 volumes, mostly from the neighbouring convents, it has also interesting manuscripts and autographs, the most ancient of which, signed by Lothair, bears date 972. Laos owes its rank as capital of the department to its central position and to its age; its numbers only 12,000 inhabitants, and has hardly any trade. The surrounding district produces vegetables and beet-root, the latter crop supplies the sugar-works, which come close to the foot of the hill; but in the town itself the only industries are coöpering and the manufacture of blankets and common woollen stuffs.

In virtue of its geographical position, the hilly district of Laos has always had some strategic importance. Even in the time of Cesar there was Galliaville where the Remi (inhabitants of the country round Rheims) had to meet the onset of the confederated Belgæ. Whatever may have been the precise locality of that battle-field, Laos was fortified by the Romans, and successfully checked the invasions of the Franks, Burgundians, Vandals, Alani, and Huns. St. Remigius, the famous archbishop of Rheims who baptised Clovis, was born in the Lacanais, and was he who instituted the bishopric of the town. Thenceforward Laos was one of the principal towns of the kingdom of the Franks, and the possession of it was often disputed. Charles the Bald had enriched its church with the gift of very numerous domains. After the fall of the Carolingians Laos took part of Charles of Lorraine, their heir, and Hugh Capet only succeeded in making himself master of the town by the connivance of the bishop, who, in return for this service, was made second ecclesiastical peer of the kingdom. Early in the 12th century the communes of France set about emancipating themselves, and the history of the commune of Laos is one of the roughest and most varied. The citizens had profited by a temporary absence of Bishop Gaudri to accept for themselves from his representatives a communal charter, but he, on his return, purchased from the king of France the revocation of this document, and recommenced his oppressions. The consequence was a revolt, in which the episcopal palace was burnt and several of his persons were put to death. The fire spread to the cathedral, and reduced it to ashes. Unceasing as the result of their victory, the rioters went into hiding outside the town, which was anew pillaged by the people of the neighbourhood, eager to avenge the death of their bishop. The king ultimately intervened in favour of the bishop and of the inhabitants till 1239. After that date the liberties of Laos were no more contested. But it retained its strategic importance, and during the

Hundred Years' War it was attacked and taken by the Burgundians, who gave it up to the English, to be retaken by the French after the coronation of Charles VII. Under the League Laos took the part of the Leaguers, and was taken by Henry IV. During the campaign of 1814 Napoleon tried in vain to dislodge Blücher from it. In 1870 an engineer blew up the powder magazine of the citadel at the moment when the German troops were entering the town. Many lives were lost, and the cathedral and the old episcopal palace were damaged by the explosion. At the Revolution Laos permanently lost its rank as a bishopric.

LAOS, or LAWA, a large Indo-Chinese nation, occupying the northern and eastern provinces of Siam known as the Laos states, mainly between 15° and 24° N. lat., 98° and 106° E. long. There are two main divisions—the Lau-pang-kai, or "White Fauché" Laos, and the Lau-pang-dun, or "Black Fauché" Laos, the former between the Deng-Piya-Phai range and the river Mekong, the latter about the middle and upper course of the river Menam, and so called from the habit of tattooing a black pattern about the navel. The Laos are closely related to the physique and speech to the Siamese proper, and are by some writers regarded as the primitive stock of that race. They are an historical people who were formerly constituted in an ancient and powerful kingdom, whose capital Vinh-kiang (Vien-shan) was taken and destroyed by the Siamese about the year 1828. Since then they have been entirely subject to Siam, and are governed partly by khiao, or native hereditary princes, partly by mandarins or governors directly nominated by the Bangkok authorities. The present khiao of the province of Bassak north of Cambodia is the last surviving descendant of the ancient Lao dynasty. The khiao are invested by means of the gold shield, betel-box, spittoon, and teapot which are sent from Bangkok, and returned at their death or deposition. Of all the khiao the most powerful is the prince of Ubon (16° N., 106° E.), whose jurisdiction extends nearly from Bassak on the Mekong northwards to the great southern bend of that river.

The many contradictory accounts of the Laos that have been published by travellers are due to the fact that quite three-fourths of the race have become mixed with the surrounding Khao or aboriginal inhabitants of the peninsula. The half-castes that have thus sprung from alliances with the Bolovens, Thêhs, Redehs, Sui, and other wild tribes of Caucasian stock present every variety between that type and the Mongolian. But those that have preserved the purity of their blood are still distinguished by the high cheek bones, small flat nose, oblique eyes, wide mouth, black lank hair, sparse beard, and yellow complexion of the Tai and other branches of the Mongol family. These are also a semi-civilized people with a knowledge of letters, followers of the Buddhist teachings, settled in small towns and villages, and engaged chiefly in agriculture. They have domesticated the elephant and buffalo, and are peaceful and industrious, being skilled in the production of lacquered wares, and silk and cotton fabrics for local use. Trading relations have also long been established with China, Siam, Burmah, and Cambodia, with which countries their ivory, gold dust, tin, gums, lac, benzoin, raw silk, skins, and sapenwood are bartered for cotton cloth, chintzes, silks, opium, hardware, and porcelain. At present a large portion of this trade is in the hands of itinerant Burmese dealers and hawkers, who are met everywhere between the Irawadi and Mekong valleys, organized in small caravans with a headman and porters all well armed, like the Povidahs of Afghanistan.

The civilized Laos have long been addicted to slave hunting, not only with the sanction but even with the co-operation of the authorities. When times are hard and tribute cannot otherwise be raised, "the Lao mandarins organize regular expeditions against the wild tribes. On some slight pretext a favourable camping ground is chosen,

whence attacks are made in all directions on villages, which they hope to surround or surprise. The savages live only in small hamlets consisting of a few huts, and they are powerless to resist the attacks of men armed with guns. These razias are usually made only against the independent savages who reject the authority of the Lao princes and refuse to pay tribute. But I have noticed that the compact by which the savages consent to surrender a part of their independence, in order to preserve their wives, children, and themselves, is far from being always respected; and the unfortunate Guis-heuns, for example, who dwell within a few leagues of Bassak, are in the greatest terror of the prince, refusing on any consideration to leave their forests or inaccessible villages.¹ The convoys of slaves, purchased chiefly by Chinese and Malay dealers from Cambodia, are forwarded mainly to Bangkok, Korat, and Phnom-penh, the present capital of Cambodia. This organized slave trade is the great cause of the nation, and tends more than all other causes combined to retard the natural development of the Lao country.

The mixed Lao peoples are distinguished from the pure stock chiefly by their more regular features, tall stature, lighter complexion, sub-dolichocephalic crania, and generally lower social condition. Most of them, although nominal Buddhists, are in reality still nature-worshippers, who make offerings of sticks and stones to the local genii, and guard their homes against evil spirits by means of brooms, cotton threads, bunches of herbage, and other curious devices. Some of them are quite as savage as the wild tribes, and, although acquainted with the use of firearms, still use the characteristic crossbow, a formidable weapon, which in skilled hands will kill a buffalo with a simple bamboo arrow at considerable distances. In some parts the confusion of types and usages is so great that the true Khas can be distinguished from the Laos only by the lobe of the ear, which is pierced for the insertion of large bone, ivory, or wooden ornaments like those worn by many of the Oceanic races.

Apart from the passions associated with the infamous slave trade, encouraged by their rulers, the Laos are an inoffensive, unwarlike, and peace-loving race, fond of music, and living chiefly on a diet of rice, vegetables, fruits, fish, and poultry. Pure and mixed, they number altogether perhaps some 1,500,000.

LĀO-TSZE, or LĀO-TSZE, the designation of the author of the celebrated treatise called *Tao Teh King*, and the reputed founder of the religion called *Taoism*. The Chinese characters composing the designation may mean either "the Old Son," which commonly assumes with foreigners the form of "the Old Boy," or "the Old Philosopher." The latter significance is attached to them by the Rev. Dr. Chalmers in his translation of the treatise published in 1868 under the title of *The Speculations on Metaphysics, Polity, and Morality of "the Old Philosopher," Lāo-tse*. The former is derived from a fabulous account of Lāo-tse which appeared in the *Shan Hsien Chuan*, "The Account of Spirits and Immortals," of Ko Hung, in our 4th century. According to this, his mother, after a supernatural conception, carried him in her womb sixty-two years (or seventy-two, or eighty-one—ten years more or fewer are of little importance in such a case), so that, when he was born at last, his hair was white as with age, and people might well call him "the old boy." The other meaning of the designation rests on better authority. We find it in the *K'ia Tsü*, or "Narratives of the Confucian School," compiled in our 3d century from documents said to have been preserved among the descendants of Confucius, and also in the brief history of Lāo-tse given in

the historical records of Sze-ma Ch'ien (about 100 a.c.). In the latter instance the designation is used by Confucius, and possibly originated with him. It should be regarded more as an epithet of respect than of years, and is equivalent to "the Venerable Philosopher."

All that Ch'ien tells us about Lāo-tse goes into small compass. His surname was LĀ, and his name Urh. He was a native of the state of Ch'ü, and was born in a hamlet, which we must place not far from the present prefectural city of Kwei-teh in Ho-nan province. What is of more importance, he was one of the recorders or historiographers at the court of Ch'ü, his special department being the charge of the whole or a portion of the royal library. He must thus have been able to make himself acquainted with all the history of his country and of the men who had played the most distinguished part in its affairs. Ch'ien does not mention the year of his birth, which is often said, though on what Chinese authority does not appear, to have taken place in the third year of King Ping, corresponding to 604 a.c. That date cannot be far from the truth. That he was contemporary with Confucius is established by the concurrent testimony of the *LĀ K'ü* and the *K'ia Tsü* on the Confucian side, and of Chwang-tse and Sze-ma Ch'ien on the Taoist. The two men whose influence has been so great on all the subsequent generations of the Chinese people, and whose views are now more attentively studied by thinking men of other nations than ever they were before—Khung-tse and Lāo-tse—had at least one interview, in 517 a.c., when the former was in his thirty-fifth year. The conversation between them was interesting. Lāo was in a mocking mood; Khung appears to the greater advantage.

If it be true that Confucius, when he was fifty-one years old, visited Lāo-tse, as Chwang-tse says (in the *Thien Yü*, the fourteenth of his treatises), to ask about the *Tao*, they must have had more than one interview. Dr. Chalmers, however, has pointed out that both Chwang-tse and Lāo-tse (a still earlier Taoist writer) produce Confucius in their writings, as the lords of the Philistines did the captive Samson on their festive occasions, "to make sport for them." Their testimony is valueless as to any matter of fact. There may have been several meetings between the two in 517 a.c., but we have no evidence that they were together in the same place after that time. Ch'ien adds—"Lāo-tse cultivated the *Tao* and virtue, his chief aim in his studies being how to keep himself concealed and unknown. He resided at (the capital of) Ch'ü; but after a long time, seeing the decay of the dynasty, he left it, and went away to the Gate (leading from the royal domain into the regions beyond,—at the entrance of the pass of Han-kü, in the north-west of Ho-nan). Yin Hsi, the warden of the gate, said to him, 'You are about to withdraw yourself out of sight; I pray you to compose for me a book (before you go).' On this Lāo-tse made a writing, setting forth his views on the *tao* and virtue, in two sections, containing more than 5000 characters. He then went away, and it is not known where he died." The historian then mentions the names of two other men whom some regarded as the true Lāo-tse. One of them was a Lāo Lāi, a contemporary of Confucius, who wrote fifteen treatises (or sections) on the practices of the school of *Tao*. Subjoined to the notice of him is the remark that Lāo-tse was more than one hundred and sixty years old, or, as some say, more than two hundred, because by the cultivation of the *Tao* he nourished his longevity. The other was "a grand historiographer" of Ch'ü, called Tan, one hundred and twenty-nine (one hundred and nineteen) years after the death of Confucius. The introduction of these disjointed notices detracts from the verisimilitude of the whole narrative in which they occur.

¹ Dr. Harmand, *Tour du Monde*, July 5, 1878.

Finally, Ch'en makes the remark that "Lao-tze was a superior man, who liked to keep in obscurity," traces the line of his posterity down to the 2d century A.D., and concludes with this important statement:—"Those who attach themselves to the doctrine of Lao-tze condemn that of the literati, and the literati on their part condemn Lao-tze, thus verifying the saying, 'Parties whose principles are different cannot take counsel together.' Li Uih taught that transformation follows, as a matter of course, the doing nothing (to bring it about), and rectification ensues in the same way from being pure and still."

Leaving these scanty historical notes, and accepting the *Tao Teh King* as the veritable work of Lao-tze, we must now try to give the reader some idea of its contents. Consisting, it has been seen, of not more than between five and six thousand characters, it is but a short treatise,—not half the size of our Gospel of St. Mark. The nature of the subject, however, the want of any progress of thought or of logical connexion between its different parts, and the condensed style, with the mystic tendencies and poetical temperament of the author, make its meaning extraordinarily obscure,—as native scholars and Sinologists have found to their cost. Divided at first into two parts, it has subsequently and conveniently been subdivided into chapters. One of the oldest, and the most common, of these arrangements makes the chapters eighty-two.

Some Roman Catholic missionaries, nearly two centuries ago, fancied that they found a wonderful harmony between many passages and the teaching of our sacred Scriptures. Montucci of Berlin, who had adopted their views, ventured to say in 1808—"Many things about a True God are so clearly expressed that no one who has read this book can doubt that the mystery of the Holy Trinity was revealed to the Chinese five centuries before the coming of Jesus Christ." Even Remusat, the first occupant of a Chinese chair in Europe, published at Paris in 1823 his *Mémoire sur la Vie et les Opinions de Lao-tze*, to vindicate the view that the Hebrew name Jehovah was phonetically represented in the fourteenth chapter by Chinese characters. These fancies were exploded by the late Stanislas Julien, when he issued in 1842 his translation of the whole treatise as *Le Livre de la Voie et de la Vertu*.

The most important thing is to determine what we are to understand by the *Tao*, for *Teh* is merely its outcome, especially in man, and is rightly translated by our word "virtue." Julien, we have just seen, translated *Tao* by "la voie." Chalmers leaves it untranslated. "No English word," he says (p. xi.), "is its exact equivalent. Three terms suggest themselves—the way, reason, and the word; but they are all liable to objection. Were we guided by etymology, 'the way' would come nearest the original, and in one or two passages the idea of a way seems to be in the term; but this is too materialistic to serve the purpose of a translation. 'Reason,' again, seems to be more like a quality or attribute of some conscious being than *Tao* is. I would translate it by 'the Word,' in the sense of the Logos, but this would be like settling the question which I wish to leave open, viz., what resemblance there is between the Logos of the New Testament and this Chinese *Tao*." Latterly some Sinologists in China have employed "nature" as our best analogue of the term. Thus Waters (*Lao-tze, A Study in Chinese Philosophy*, p. 45) says:—"In the *Tao Teh King* the originator of the universe is referred to under the names Non-Existence, Existence, Nature (*Tao*), and various designations,—all which, however, represent one idea in various manifestations. It is in all cases Nature (*Tao*) which is meant." This view has been skillfully worked out; but it only hides from us the scope of "the Venerable Philosopher." "Nature" cannot

be accepted as a translation of *Tao*. That character was, primarily, the symbol of a way, road, or path; and then, figuratively, it was used, as we also use *roy*, in the senses of means and method,—the course that we pursue in passing from one thing or concept to another as its end or result. It is the name of a quality. Professor Douglas has well said (*Confucianism and Taoism*, p. 159).—"If we were compelled to adopt a single word to represent the *Tao* of Confucius, we should prefer the sense in which it is used by Confucius, 'the way,' that is, *μῆδος*."

What then was the quality which Lao-tze had in view, and which he thought of as the *Tao*,—there in the library of Ch'au, at the pass of the valley of Han, and where he met the end of his life beyond the limits of the civilized state? It was the simplicity of spontaneity, action (which might be called non-action) without motive, free from all selfish purpose, resting in nothing but its own accomplishment. This is found in the phenomena of the material world. "All things spring up without a word spoken, and grow without a claim for their production. They go through their processes without any display of pride in them, and the results are realized without any assumption of ownership. It is owing to the absence of such assumption that the results and their processes do not disappear" (chap. ii.). It only needs the same quality in the arrangements and measures of government to make society beautiful and happy. "A government conducted by sages would free the hearts of the people from inordinate desires, fill their bellies, keep their ambitions feeble, and strengthen their bones. They would constantly keep the people without knowledge and free from desires; and, where there were those who had knowledge, they would have them so that they would not dare to put it in practice" (chap. iii.). A corresponding course observed by individual man in his government of himself becoming again "as a little child" (chaps. x. and xxviii.) will have corresponding results. "His constant virtue will be complete, and he will return to the primitive simplicity" (chap. xxviii.).

Such is the subject matter of this *Tao Teh King*,—the operation of this method or *Tao*, "without striving or crying," in nature, in society, and in the individual. Much that is very beautiful and practical is inculcated in connexion with its working in the individual character. The writer seems to feel that he cannot say enough on the virtue of humility (chap. viii., &c.). There were three things which he prized and held fast,—gentle compassion, economy, and the not presuming to take precedence in the world (chap. lxvii.). His teaching rises to its highest point in chap. lxiii.—"It is the way of *Tao* not to act from any personal motive, to conduct affairs without feeling this trouble of them, to taste without being aware of the flavour, to account the great as small and the small as great, to recompense injury with kindness." This last and noblest characteristic of the *Tao*, the requiting "good for evil," is not touched on again in the treatise; but we know that it excited general attention at the time, and was the subject of conversation between Confucius and his disciples (*Confucian Analects*, xiv. 36).

What is said in the *Tao* on government is not, all of it, so satisfactory. The writer shows, indeed, the benevolence of his heart. He seems to condemn the infliction of capital punishment (chaps. lxixii. and lxixiv.), and he deplores the practice of war (chap. lxi.). But he had no sympathy with the progress of society or with the culture and arts of life. He says (chap. lxv.).—"Those who anciently were skilful in practising the *Tao* did not use it to enlighten the people; their object rather was to keep them simple. The difficulty in governing the people arises from their having too much knowledge, and therefore he who tries to govern a state by wisdom is a scourge to it,

while he who does not try to govern thereby is a blessing." The last chapter but one is the following:—"In a small state with a few inhabitants, I would so order it that the people, though supplied with all kinds of implements, would not (care to) use them; I would give them cause to look on death as a most grievous thing, while yet they would not go away to a distance to escape from it. Though they had boats and carriages, they should have no occasion to ride in them. Though they had buff-coats and sharp weapons, they should not use or use them. I would make them return to the use of knotted cords (instead of written characters). They should think their coarse food sweet, their plain clothing beautiful, their poor houses places of rest, and their common simple ways sources of enjoyment. There should be a neighbouring state within sight, and the sound of the fowls and dogs should be heard from it to us without interruption, but I would make the people to old age, even to death, have no intercourse with it."

On reading these sentiments, we must judge of *Lao-tze* that, with all his power of thought, he was only a dreamer. But thus far there is no difficulty arising from his language in regard to the *Tao*. It is simply a quality, descriptive of the style of character and action, which the individual should seek to attain in himself, and the ruler to impress on his administration. The language about the *Tao* in nature is by no means so clear. While Professor Douglas says that "the way" would be the best translation of *Tao*, he immediately adds—"But *Tao* is more than the way. It is the way and the way-giver. It is an eternal road; along it all beings and things walk; but no being made up for it is being itself; it is everything, and nothing, and the cause and effect of all. All things originate from *Tao*, conform to *Tao*, and to *Tao* at last they return."

Some of these representations require modification; but no thoughtful reader of the treatise can fail to be often puzzled by what said on the point in hand. Julien, indeed, says with truth (p. xlii.) that "it is impossible to take *Tao* for the primordial Reason, for the sublime Intelligence, which has created and governs the world"; but the fact is that many of *Lao-tze's* statements are unthinkable if there be not behind the *Tao* the unexpressed recognition of a personal creator and ruler. Granted that he does not affirm positively the existence of such a Being, yet certainly he does not deny it, and his language even implies it. It has been said, indeed, that he denies it, and we are referred in proof to the fourth chapter:—"The *Tao* is like the emptiness of a vessel; and the use of it, we may say, must be free from all self-sufficiency. How deep and mysterious it is, as if it were the author of all things! We should make our sharpness blunt, and unravel the complications of things; we should attempt our brightness, and assimilate ourselves to the obscurity caused by dust. How still and clear is *Tao*, a phantom with the semblance of permanence! I do not know whose son it is. It might appear to have been before God (T'ien)."

The reader will not overlook the cautious and dubious manner in which the predicates of *Tao* are stated in this remarkable passage. The author does not say that it was before God, but that "it might appear" to have been so. Nowhere else in his treatise does the nature of *Tao* as a method or style of action come more clearly. It has no positive existence of itself; it is but like the emptiness of a vessel, and the manifestation of it by men requires that they endeavour to free themselves from all self-sufficiency. Whence came it? It does not shock *Lao-tze* to suppose that it had a father, but he cannot tell whose son it is. And, as the feeling of its mysteriousness grows on him, he ventures to say that "it might appear to have been before God."

There is here no denial but express recognition of the

existence of God, so far as it is implied in the name *T'ien*, which is the personal name for the concept of Heaven as the ruling power, by means of which the fathers of the Chinese people rose in prehistoric time to the idea of God. Again and again *Lao-tze* speaks of heaven just as "we do when we mean therein the Deity who presides over heaven and earth." These last words are taken from Watters (p. 81), and, though he adds, "We must not forget that this heaven is inferior and subsequent to the mysterious *Tao*, and was in fact produced by it," it has been shown how rash and unwarranted is the ascription of such a sentiment to "the Venerable Philosopher." He makes the *Tao* prior to heaven and earth, which is a phrase denoting what we often call "nature," but he does not make it prior to heaven in the higher and immaterial usage of that name. The last sentence of his treatise is:—"It is the *Tao*—the way—of Heaven to benefit and not injure; it is the *Tao*—the way—of the sage to do and not strive."

It is impossible to go, in the present article, into an exposition of the *Tao T'eh Kung* at greater length. Since Julien died in 1842, there has been, as we have seen, a tendency to overestimate rather than to underestimate its value as a scheme of thought and a discipline for the individual and society. There are in it, indeed, lessons of unsurpassed value, such as the inculcation of simplicity, humility, and self-abnegation, and especially the brief enunciation of the divine duty of returning good for ill; but there are on the other hand the regretful representations of a primitive society when men were ignorant of the rudiments of culture, and the longings for its return.

When it was thought that the treatise made known the doctrine of the Trinity, and even gave a phonetic representation of the Hebrew name *Iehovah*, it was natural, even necessary, to believe that its author had had communication with more western parts of Asia, and there was no end of speculation about visits to India and Judea, and even to Greece. The necessity for assuming such travels has passed away, and they have ceased to be thought of. We can restore *Szu-mu Chien's* histories as reliable. *Lao-tze* might have heard, in the states of *Ch'iu* and among the wild tribes adjacent to them, views about society and government very like his own. *Ch'ien* relates how an envoy came in 624 B.C.—twenty years, that is, before the date assigned to the birth of *Lao-tze*—to the court of Duke M' of Ch'iu, sent by the king some rich loads on the west. The duke told him of the histories, poems, codes of rites, music, and laws which they had in the middle states, while yet rebellion and disorder were of frequent occurrence, and asked how good order was secured all among the wild people, who had none of those appliances. The envoy smiled, and replied that the troubles of China were occasioned by those very things of which the duke wanted, and that there had been a gradual degeneration in the condition of its states, as their professed civilization had increased, even since the days of the ancients ago, *Hwang Ti*, whereas in the land he came from, where there was nothing but the primitive simplicity, their princes showed a pure virtue in their treatment of the people, who responded to them with loyalty and good faith. "The government of a state," said he in conclusion, "is like a man's ruling his own single person. His rule is, and does not consist in, doing so; and this was indeed the method of the sages." *Lao-tze* did not need to go further afield to find all that he has said about government.

We have confined ourselves to the *Tao T'eh Kung* without touching on the religion *Taoism* now existing in China, but which did not take shape until more than five hundred years after the death of *Lao-tze*, though he now occupies the second place in its trinity of "The three Pure or Holy Ones." There is hardly a word in his treatise that savours either of superstition or religion. In the works of *Lao-tze* and *Chuang-tze*, his earliest followers of note, we find abundance of grotesque superstitions; but their beliefs of kind we can say that they had belied; had not become embodied in any religious institutions. When we come to the *Ch'in* dynasty (221-206 B.C.), we meet with a *Taoism* in the shape of a search for the fairy islands of the eastern sea, where the herb of immortality might be gathered. In our first century a magician, called *Chang T'ao-ling*, came before us as the chief professor and controller of this *Taoism*, preparing in retirement "the pill" which rescued his youth, supreme over all spirits, and destroying millions of demons by a stroke of his pencil. He left his books, talismans, and charms, with his sword and seal, to his descendants, and one of them, professing to be animated by his soul, dwells at this day on the *Lung-ku* mountain in *Keang-se*, the acknowledged head or pope of *Taoism*. But even then the system was not yet a religion, with temples or monasteries, liturgies, and forms of public worship. It borrowed all these from Buddhism, which first obtained public

recognition in China between 65 and 70 A. D., though at least a couple of centuries passed before it could be said to have become common in the country.

Even still, with the form of a religion, Taoism is in reality a conglomeration of base and dangerous superstitions. Alchemy, geomancy, and spiritualism have dwelt and dwell under its shadow. Each of its "three Holy Ones," has the title of *Three Zens*, "the Heavenly and Honoured," taken from Buddhism, and also of *Shang Ti* or God, taken from the old religion of the country. The most popular deity, however, is not one of them, but has the title of *Ta Tsang Shang Ti*, "God, the Perfect King." But it would take long to tell of all its "celestial gods," "great gods," "divine rulers," and others. It has been decided, we have said, whether *Lao-tzu* acknowledged the existence of God at all, but the Taoism of the present day is a system of the wildest polytheism. The science and religion of the West will meet from it a most determined opposition. The "Venerable Philosophers" himself would not have welcomed them. The shrieking of our steam-engines, the bustle of our commerce, and this onward march of our various enterprises would have nearly driven him mad, but he ought not to bear the obliquity of being the founder of the Taoist religion. (J. L. B.)

LA PAZ, officially since 1825 L. P. DE AYACUCHO, in memory of the battle of Bolivian Independence, is the capital of Bolivia, at the head of a department of its own name. It lies in 16° 30' S lat and 68° W long., at the height of 11,970 feet above the sea, in the valley of the Chuquapuro or Rio de la Paz, at the base of the Cordillera Real, which rises with imposing cliffs another thousand feet above it. About 40 miles to the east of Lake Titicaca, La Paz has regular coach and steamer communication with Puno, and so with Mollendo on the Pacific. Commercially the town is of very considerable importance as the centre of the Bolivian trade in coca and cinchona. Among the public buildings are the cathedral founded by Pope Paul V in 1605, and ranking as one of the finest in South America, the church of San Francisco erected by the Jesuits, the university (San Andres), and the president's palace. The population, which consists largely of Aymaras, is estimated at between 70,000 and 80,000. The city dates from 1548, and the name Pueblo Nuevo de N. Señora de la Paz was given by its founder, Alonso de Mendoza in honour of the reconciliation between Pizarro and Almagro. In 1605 it was made a bishopric.

LA PÉROUSE, JEAN-FRANÇOIS GALATÉE DE (1741–c 1785), a French navigator, was born near Albi, August 22, 1741. His family name was Galaput, and La Pérouse or La Peyrouse was an addition adopted by himself from a small family estate. As a lad of eighteen, he was wounded and made prisoner on board the "Formidable" when it was captured by Admiral Hawke in 1759; and during the war with England between 1778 and 1783 he served with distinction in various parts of the world, more particularly on the eastern coasts of Canada. His celebrity, however, is rather due to the expedition fitted out by the French Government in 1785 for the discovery of the North-West Passage, and the verification of various matters left doubtful by previous circumnavigators. La Pérouse was placed in command of the "Boussole" and his chief assistant De Langie in command of the "Astrolabe." They sailed from Brest, August 1, 1785, and reached Mount St. Elias, on the coast of Alaska, June 23, 1786. From the search for the North-West Passage they were detained by the same storms which had proved too much for earlier adventurers; and, though they visited the Sandwich Islands, Macao, and the Philippines, it was not till they reached the coasts of north-western Asia that they really broke new ground. There the discovery of Sangai Strait and La Pérouse Strait showed that Saghalien and Yezo were each an independent island. The explorers were well received by the Russian authorities in Kamchatka, and M. Lesseps was sent home overlaid with the records of the expedition. In December 1787, De Langie, Lamonon the naturalist, and ten of the crew of the "Astrolabe," were massacred on one of the Navigator Islands; and, after reaching Botany Bay in

safety, the rest of the expedition was not again heard of. It was not till 1825 that Captain Dillon found the wreckage of what must have been the "Boussole" and the "Astrolabe" on the reefs of Vanikoro, an island to the north of the New Hebrides.

See Milet Minard, *Voyage de la Pérouse autour du Monde*, Paris, 1797, 4 vols.; Peter Dillon, *Narrative of a Voyage on the South Sea*, London, 1829.

LAPIDARY (*lapidarius*, from *lapis*, a stone), one who cuts, grinds, polishes, and engraves small pieces of stone, especially gems. The prehistoric stone implements found in cave deposits, peat mosses, river-gravels, &c., may be regarded as the earliest examples of the chipping and grinding of stone. Small cylinders of serpentine and other soft stones, on which figures and inscriptions were engraved, were fabricated in very early times by the Assyrians. Similar cylinders were afterwards made in rock-crystal, chalcedony, hematite, &c., and these harder substances were engraved by means of drills clamped with the powder of still harder minerals. The use of such drills is said to date as far back as the year 730 B.C. These cylinders were perforated by round holes, and were stung as needles. The stone scarabei and other amulets of the Egyptians were carved or chiselled, and, according to King (*Handbook of Engraved Gems*, 1866), these people do not appear to have followed the Ninevites and Babylonians in the use of the drill. This tool was, however, largely employed by the Etruscan lapidaries, who also used a diamond point in finishing their work. Signets were used by the Greeks as early as 600 B.C. and in the time of Alexander gems of all kinds were cut and engraved, with the exception of the diamond. The art of cutting diamonds was probably known to the Hindus and the Chinese in very early times, but it was unknown in Europe until nearly the close of the 16th century, the diamond cut and polished for Charles the Bold, duke of Burgundy, in 1476 being the first recorded example. The diamond point was extensively used in engraving the gems of the 16th, 17th, and early part of the 18th centuries, when skillful imitations of the antique gems were fabricated, and the employment of this tool is already spoken of by Pliny (*H. N.*, xxxviii 15) and Solinus, c 52. The drills used by the ancients were worked either by hand or with a bow. Holes are now drilled in stone by means of an iron or copper tube, fed with diamond dust and oil (fig 1).

The small tools used for engraving stones are set in a horizontal position, and are worked by vertical driving (fig 2). They are of various forms, some of which are shown in fig. 3, and are made of soft iron and charged with diamond dust and oil. Any substance finely pulverized, and of greater hardness than the material operated upon, may be used for cutting and grinding stone, but diamond dust is preferred as it can be used sparingly by the employment of very thin slitting disks, into the edges of which it is imbedded by the application of an agate or glass roller, the dust being previously worked into a paste with oil. Oil of brack or soft soap is used freely as a lubricant during the process of cutting. The diamond powder is produced by finely pulverizing imperfect stones, usually the coarse variety termed *brak* or *carbonade*, in a steel mortar, or it is ground between flat iron slabs with oil of brack.

The iron slicing disk in common use is 8 or 9 inches in

diameter and about $\frac{1}{16}$ inch in thickness. Such disks with their driving gear are termed *slitting-mills*. When leaden laps charged with emery mud are substituted the arrangement is called a *roughing-mill*, and when leaden or pewter laps charged with rotten-stone are used it is known as a *polishing-mill*. The mills are sometimes worked by steam power, sometimes by hand. In the ordinary pattern of a lapidary's bench the handle turns in a horizontal plane, as shown in fig. 4, where W is the driving-wheel turned by

FIG. 4.—Lapidary's Mill

the handle A, and working the pulley P by means of a step. The pulley is fixed on a vertical spindle, which carries M the disk for slitting or the leaden lap for roughing or polishing. The upper end of this spindle is conical, and rotates in a socket drilled in a horizontal arm of iron which projects from a vertical wooden rod D. A block of wood C fits on to the end of an iron support terminal the *gim-peg* or *germ-peg*. This support is used to steady the operator's arm when grinding the edges of small stones, and the wooden block, which is fixed by a wedge, is employed for cutting facets at any desired angle, the stone being cemented to the end of a stick S, which is fixed at the requisite angle in one of the holes or notches made in the sides of the socket C. In slicing stones it is necessary not to bring any sharp edge of the stone against the disk, but to commence upon a moderately flat or smooth surface, otherwise the charge of diamond dust or *seasoning*, which should last for several hours, will be stripped off during the first revolution.

Another form of lapidary's mill consists of a strong framework of oak, 8 or 9 feet long by 6 or 7 feet in height, and with a breadth of about 2 feet. It is formed of four square uprights, mortised into a couple of sole-bars, and braced together by eight cross-bars at top and bottom, which, like all the other parts of the frame, are mortised and strongly bolted together. Half way up the frame a strong board or table is fixed, and above and below this table stout wooden bars or *summers* run the length of the frame. In each of these summers are two square holes through which slide short oaken rods having square sections and bored out conically at the ends to re-

ceive the upper and lower extremities of the iron spindles which carry the laps or sheets (fig. 5). The remainder of the working parts are very similar to those already described, except that the driving-wheels are very large and the lower extremities of their alstrees, which are conical, rest upon sockets fixed to the floor, while their upper ends revolve in holes in a beam. The driving wheels drop over pegs which project from the upper sides of collates, immediately beneath which the axle has a crank. The crank is connected with an arm composed of three flat iron bolts, which are fixed together at suitable lengths by square rings. The other end of the crank bar is provided with a stud by which it is attached to a pivoted wooden arm carrying two upright pegs, which serve as handles for the operator, who imparts a backward and forward motion to the arm.

A very important substitute for the gim-peg-socket, already described, is the *dial*, by means of which facets can be cut with great precision. One of the improved forms of the lapidary's dial consists of two jaws *a, a* (fig. 6), in each of which a hemispherical cavity is ground, and within this cavity a brass ball *b* is contained by the jaws when they are clamped together. A brass tube is attached to this ball, and carries a conical dial *d* at its upper end. Into the lower end of the tube is tightly inserted the cement-rod, which is fixed by a set-screw carrying at its lower end *e* the stone to be cut. At its upper end, which is squared, and projects above the dial, a small index *f* is fitted. Upon the side of one of the jaws is a divided quadrant *g*, with the centre of which the centre of the brass ball coincides. The tube bearing the dial can therefore be inclined at any angle corresponding with the divisions on the exposed face of the quadrant, while, by turning the cement-stick and its index, the stone can be easily set, so that a range of facets may be cut with great accuracy.

Where practicable, the lapidary avails himself of the natural cleavages in the mineral upon which he is going to operate, and these are constant in direction in any one species, but are more easily available in certain minerals than they are in others. When no satisfactory cleavage planes exist, the mineral may be sawn into slabs by a thin wire charged with diamond dust. The diamond is cut and polished upon a lap of cast-iron fed with diamond dust and olive oil. Gems having a hardness of 8 and 9 (Mohs's scale) are cut on copper disks, simi-

FIG. 7.—Cut Gems. A, brilliant; B, rose; C, gout de suit; D, en cabochon.

larly primed, and are afterwards polished with tripoli and water. Stones of inferior hardness are ground upon a leaden lap with emery and water, and are polished on tin disks with tripoli, or on zinc disks with putty-powder and water. In grinding very

fragile or soft stones disks of hardwood are employed. Precious stones are cut in forms known as *brilliant* and *rose*, and the several parts are designated as shown in fig. 7 (side-elevations). Turquoise, opal, cat's-eye, carnelian, jasper, and a few other stones are cut en cabochon.

Prior to engraving on a stone, the polish is removed with emery from the surface to be engraved, and the device marked on it with a brass point, the outline is then sharply incised, and the work continued by means of small drills, the diamond point, &c.

Within the last few years a great advance has been made in our knowledge of the minute structure and mineral constitution of rocks by cutting and grinding small slices of them so thin that they readily transmit light, and can then be examined under the microscope, and the optical properties of their constituent minerals conveniently studied. Sections suitable for this purpose may be prepared by grinding thin flakes or splinters of a rock or mineral upon a cast iron plate smeared with emery powder and water. The emery employed for the first grinding should not be very fine, that of medium grain being best suited for the purpose. The fragment is pressed by the fingers against the slab, and ground uniformly over all parts of the plate with a circular motion. When a flat surface is obtained, the fragment should be carefully washed from all traces of the emery mud, and a finer face should be imparted to it by a second grinding with the finest flour-emery and water, smeared upon a slab of plate-glass or a smoothly-planed brass slab. When thoroughly cleaned, the smooth face of the chip is warmed and cemented to a small piece of plate-glass with Canada balsam (fig. 8). The oilier and drier the balsam the better it answers this purpose. A little should be placed on the piece of glass and warmed until it liquefies (it must not boil). The smooth surface of the stone is then laid upon the balsam and pressed tightly against the glass, when the balsam has hardened, the grinding process is renewed, the piece of glass serving as a handle, and the flour-emery should generally be employed as soon as the fragment is thin enough to transmit light. When finished, the glass and section are cleaned, the glass is warmed, and the section is pushed off with a blunt needle or wire into a saucer of turpentine, which should be gently warmed, and all traces of dirt should be removed with a camel's hair brush. The section is then lifted from its bath by means of a needle and allowed to subside gently upon a drop of fluid Canada balsam placed on a clean glass slip which has been previously warmed. A thin covering-glass is then slightly warmed and placed over the preparation, care being taken not to include any air-bubbles. The process of grinding sections by hand is necessarily a rather slow one, and, although in the finishing it cannot well be superseded by other methods, still the rough grinding may be much more expeditiously done by means of various machines which have been devised for this purpose. Some of these are worked by hand, others by a treadle. Among the latter, the apparatus devised by Mr J. B. Jordan, and manufactured by Messrs Cotton & Johnstone of Grafton Street, Solihull, and that made by Fuess of Berlin are those in most general use. These machines are provided with slitting disks for cutting thin slices with diamond dust. This saves much grinding, but presents some difficulties to the novice. The grinding laps with which the machines are supplied are generally cast in lead or pewter, while occasionally prepared corundum disks are employed, and disks of hard wood are now and then used for imparting a final polish.

Fig. 8

LAPIS LAZULI, a mineral possessing usually a fine blue colour, whence it is much prized for decorative purposes. From the large number of Egyptian ornaments in this material, which have been preserved from the time of the Pharaohs, it is evident that it was a favourite stone with the ancient Egyptians. A few Assyrian seal-cylinders in lapis lazuli are also known. It appears to have been the Greek sapphire, thus, Theophrastus describes the *sappheiros* as sprinkled with gold-dust, a description which is utterly inappropriate to any variety of our modern sapphire, but which applies with much force to the lapis lazuli, inasmuch as this stone frequently contains disseminated particles of iron pyrites, which by their colour and lustre may readily be mistaken for such a metal. In like manner, Pliny refers to one variety of the *sapphus* as being spotted with gold. An allusion to the same quality is plainly found in Job xxviii. 6.

It is but rarely that the lapis lazuli exhibits anything approaching to distinct crystallization. Usually it occurs in compact masses, which break with an uneven fracture but occasionally it presents an imperfect cleavage parallel to the faces of a rhombic dodecahedron, and still more rarely offers distinct faces of form. Its specific gravity is about 2.3, and its degree of hardness between 5 and 6, it therefore scratches glass, and is capable of receiving a fair polish. Although the colour is generally a fine azure, or rich Berlin blue, some varieties exhibit violet, green, or even red tints, or are altogether colourless. The mineral is always opaque, with only slight translucency at the edges. Microscopic sections reveal a want of homogeneity in the constitution of the substance, bluish particles being disseminated through a white matrix.

The lapis lazuli is a silicate of aluminium, calcium, and sodium, but the published analyses are rather discordant. All agree, however, in recording the presence of sulphur, and it is generally supposed that this element exists as a sulphide of iron and sodium, and that it is upon the presence of such a compound that the blue colour depends. The following is an analysis of the South American variety—silica, 45.7; alumina, 25.4; soda, 10.65; potash, 1.35; lime, 7.48; ferric oxide, 1.30; sulphur, 3.66; and sulphuric acid, 4.32. By the action of hydrochloric acid the mineral is decomposed, with separation of gelatinous silica and evolution of sulphuretted hydrogen. Before the blowpipe it fuses readily, with loss of colour.

The lapis lazuli is usually found in crystalline limestone or in gneissous rocks, but its occurrence is confined to very limited localities. It is found in Persia, Tartary, Tibet, and China, and in the neighbourhood of Lake Baikal in Siberia. Fine masses occur in the Andes of Chili and Peru. In Europe it has been found at Dniep in Transylvania, and in the gneiss blocks of Monte Somma. In addition to its use as an ornamental stone, the lapis lazuli was formerly employed, to a large extent, in the preparation of the beautiful blue pigment called *ultramarine*. For this purpose the mineral was ground, calcined, and carefully leached in water. Of late years, however, artificial ultramarine has been prepared which claims to be of equal beauty and permanency with the natural pigment. Artists, however, still regard the natural colour as superior.

LAPITHÆ, a mythic race whose contest with the Centaurs is one of the most famous events in Greek mythology and one of the most favourite subjects of Greek art. The home of the legend is the district round Mount Pelion in Thessaly, it is not found in the other places where the Centaur legend has its home—Pholoe in Arcadia, and the river Eryman in Ætolia. It is impossible to write of the Lapithæ without including also their adversaries the Centaurs and the great battle at the marriage of Pirithous and Deidamia. The outlines of the legend have already been given under CENTAUR; here we shall merely attempt to distinguish between earlier and later elements in the myth, and thus trace its growth. By the Greek sculptors of the school of Phidias the battle of Lapithæ with Centaurs was conceived as a struggle between mankind and mischievous monsters, and symbolical of the great conflict between Greeks and Persians. There can be no

doubt that such a moralized view is of later growth, and inconsistent with the original character of mythology; though the battle is certainly conceived under this form from an early time, and universally throughout the historical period. But on the other hand the genealogies given of the Lapithæ make them a brother race with the Centaurs. Pirithous, king of the Lapithæ, was son of Ixion; so were the Centaurs. Various other accounts lead to the same result. Ultimately then the battle of Lapithæ with Centaurs is a contest of the physical powers of nature, and the excellent discussion of Professor S Colvin (*Journ. Hist. Stud.*, 1. p. 164) leaves little room for doubt that the Centaurs represent the power—dangerous, yet sometimes beneficent—of mountain floods, and that the battle is the mythic expression of the terrible effects of swollen waters. No satisfactory derivation of the word *Lapithæ* has yet been found, but some of the names of individual Lapithæ, such as Dryas, Charaxus, Caneus son of Elate, &c., refer us to the trees and ravines of the mountains.

Beside the article of Professor Colvin, and the numerous works on Greek mythology, see Welcker, *Kt. Schr.*, vol. II.

LAPLACE, PIERRE SIMON, MARQUIS DE (1749-1827), one of the greatest mathematicians and physical astronomers who ever lived, was born at Beaumont-en-Auge in Normandy, March 28, 1749. His early years have remained in the obscurity with which poverty and some ignoble shame of poverty combined to cover them. It is known, however, that his father was a small farmer, and that he owed his education to the interest excited by his lively parts in some persons of position. His first distinctions are said, singularly enough, to have been gained in theological controversy, but at an early age he became mathematical teacher in the military school of Beaumont, the classes of which he had attended as an extern. He was not more than eighteen when, armed with letters of recommendation, he approached D'Alembert, then at the height of his fame and influence, in the hope of finding a career in Paris. The letters remained unnoticed, but Laplace was not a man to be crushed by the first rebuff of fortune. He wrote to the great geometer a letter on the principles of mechanics, which evoked an immediate and enthusiastic response "You," said D'Alembert to him, "needed no introduction; you have recommended yourself; my support is your due." He accordingly obtained for him an appointment as professor of mathematics in the École Militaire of Paris, and continued to forward his interests with zeal and constancy.

The future of the young mathematician was now assured, and his scientific vocation finally determined. He had not yet completed his twenty-fourth year when he entered upon the course of discovery which has earned him the title of "the Newton of France." Having, in his first published paper,¹ shown his mastery of analysis, he immediately proceeded to apply the powerful instrument at his command to the great outstanding problems in the application of the law of gravitation to the celestial motions. Of these the most conspicuous was offered by the opposite inequalities of Jupiter and Saturn, which the strenuous efforts of Euler and Lagrange had failed to bring within the bounds of theory. The discordance of their results incited Laplace to a searching examination of the whole subject of planetary perturbations, and his maiden effort was rewarded with a discovery which constituted, when developed and completely demonstrated by his own further labours and those of his illustrious rival Lagrange, the most important advance made in physical astronomy

since the time of Newton. In a paper read before the Academy of Sciences, February 10, 1773 (*Mém. présentés par divers Savans*, tom. vii., 1776), Laplace announced his celebrated conclusion of the invariability of planetary mean motions, carrying the proof as far as the cubes of the eccentricities and inclinations. This was the first and most important step in the establishment of the stability of the solar system. It was followed up by a series of profound investigations, in which Lagrange and Laplace alternately surpassed and supplemented each other in assigning limits of variation to the several elements of the planetary orbits. The analytical tournament closed with the communication to the Academy by Laplace, in 1787, of an entire group of remarkable discoveries. It would be difficult, in the whole range of scientific literature, to point to a memoir of equal brilliancy with that published (divided into three parts) in the volumes of the Academy for 1784, 1785, and 1786. The long-sought cause of the "great inequality" of Jupiter and Saturn was found in the near approach to commensurability of their mean motions; it was demonstrated in two elegant theorems (see *Astronomy*, vol. ii. p. 781), independently of any except the most general considerations as to mass, that the mutual action of the planets could never largely affect the eccentricities and inclinations of their orbits; and the singular peculiarities detected by him in the Jovian system were expressed in the so-called "laws of Laplace" (*Astronomy*, p. 810). He completed the theory of these bodies in a treatise contained amongst the Paris *Mémoires* for 1788 and 1789, and the tables computed by Delambre from the data there supplied served, by their striking superiority to those hitherto available, to mark the profit derived from the investigation by practical astronomy.² The year 1787 was rendered further memorable by Laplace's announcement, November 19 (*Mémoires*, 1786), of the dependence of lunar acceleration upon the secular changes in the eccentricity of the earth's orbit. The last apparent anomaly, and the last threat of instability, thus disappeared from the solar system.

With these brilliant performances the first period of Laplace's scientific career may be said to have closed. If he made no more striking discoveries in celestial mechanics, it was rather their subject matter than his powers that failed. The general working of the great machine was now laid bare, and it needed a further advance of knowledge to render a fresh set of problems accessible to investigation. The time had come when the results obtained in the development and application of the law of gravitation by three generations of illustrious mathematicians might be collected in a single work, and presented from a single point of view. It was to this task that the second period of Laplace's activity was devoted. As a monument of mathematical genius applied to the celestial revolutions the *Mécanique Céleste* ranks second only to the *Principia* of Newton.

The declared aim of the author³ was to offer a complete solution of the great mechanical problem presented by the solar system, and to bring theory to coincide so closely with observation that empirical equations should no longer find a place in astronomical tables. His success in both respects fell but little short of his lofty ideal. The first part of the work (2 vols. 4to, Paris, 1799) contains methods for calculating the movements of translation and rotation of the heavenly bodies, for determining their figures, and resolving tidal problems; the second, especially dedicated to the improvement of tables, exhibits in the third and fourth volumes (1802 and 1809) the application of three formulae; while a fifth volume, published in three instalments, 1823-25, comprises the results of Laplace's latest researches, together with a valuable history of progress in each separate branch of his subject. In the delicate task of apportioning his own large share of merit, he certainly does not err on

¹ "Recherches sur le calcul intégral," *Mémoires de la Soc. Roy. de Turin*, 1786-89.

² Girard, *History of Physical Astronomy*, p. 96.

³ "Plan de l'ouvrage," *Œuvres*, tom. I. p. 1.

the sake of modesty; but it would perhaps be as difficult to produce an instance of injustice, as of generosity, in his estimate of others. For more serious blame attaches to his all but total suppression in the body of the work—and the fault pervades the whole of his writings—of the names of his predecessors and contemporaries. Theorems and formulae are appropriated wholesale without acknowledgment, and a production which may be described as the organized result of a century of patient toil presents itself to the world as the offspring of a single brain. The *Mécanique Céleste* is, even to those most conversant with analytical methods, by no means easy reading. The late M. Biot, who had the privilege of assisting in the correction of its proof sheets, remarks that it would have extended, had the demonstrations been fully developed, to eight or ten instead of five volumes, and he saw at times the author himself obliged to devote an hour's labour to recovering the dropped links in the chain of reasoning covered by the recurring formula, "Il est assés à voir".¹

The *Exposition du Système du Monde* (Paris, 1796) has been styled by Arago "the *Mécanique Céleste* disembarassed of its analytical paraphernalia." Not only the conclusions reached by geometers are stated, but the methods followed by them are indicated. The instruments, so to speak, of a popular dissertation clothe and conceal the skeleton of an analytical treatise. The style is lucid and masterly, and the summary of astronomical history with which it terminates has been reckoned amongst the masterpieces of the language. To this linguistic excellence the writer owed the place accorded to him in 1810 amongst the "forty" of the French Academy, of which institution he became president in the following year. The famous "nebular hypothesis" of Laplace makes its appearance in the *Système du Monde*. Although relegated to a note (vii.), and propounded "Avec la défiance qui doit inspirer tout ce qui n'est point un résultat de l'observation ou du calcul," it is plain, from the complacency with which he recurs to it² at the lapse of above a quarter of a century, that he regarded the speculation with considerable interest. That it formed the starting-point, and has remained the model, of thought on the subject of planetary origin is due to the simplicity of its assumptions, and the clearness of the mechanical principles involved, rather than to any cogent evidence of its truth. It is curious that Laplace, while bestowing more attention than they deserved on the crude conjectures of Buffon, seems to have been unaware that he had been, to some extent, anticipated by Kant, who had put forward in 1755, in his *Allgemeine Naturgeschichte*, a true nebular cosmogony, though one in which the primitive reign of chaos was little likely to terminate.

The career of Laplace was one of severely interrupted prosperity. Admitted to the Academy of Sciences as an associate in 1773, he became a member in 1785, having, about a year previously, succeeded Bezout as examiner to the royal artillery. During a temporary access of revolutionary suspicion, he was removed from the commission of weights and measures; but the slight was quickly effaced by new honours. He was one of the first members, and became president, of the Bureau of Longitudes, took a prominent place at the Institute (founded in 1796), professed analysis at the École Normale, and aided in the organization of the decimal system. The publication of the *Mécanique Céleste* gained him world-wide celebrity, and his name appeared on the lists of all the principal scientific associations of Europe, including the Royal Society. But merely scientific distinctions by no means satisfied his ambition. He aspired to the rôle of a politician, and has left a memorable example of genius degraded to servility for the sake of a ribbon and a title. The ardour of his republican principles gave place, after the 18th Brumaire, to devotion towards the first consul, a sentiment promptly rewarded with the post of minister of the interior. His

insipidity for affairs was, however, so flagrant that it became necessary to supersede him at the end of six weeks, when Lucien Bonaparte became his successor. "He brought into the administration," according to the dictum of the future emperor, "the spirit of the infinitesimals." His failure was consoled by elevation to the senate, of which body he became chancellor in September 1803. He was at the same time named grand officer of the Legion of Honour, and obtained in 1813 the same rank in the new order of Réunion. The title of count he had previously acquired on the creation of the empire. Nevertheless he cheerfully gave his voice in 1814 for the dethronement of his patron, and his "suppleness" merited a seat in the chamber of peers, and, in 1817, the dignity of a marquise. The memory of these tergiversations is perpetuated in his writings. The first edition of the *Système du Monde* was inscribed to the Council of Five Hundred; to the third volume of the *Mécanique Céleste* (1802) was prefixed the declaration that, of all the truths contained in the work, that most precious to the author was the expression of his gratitude and devotion towards the "pacifier of Europe", upon which noteworthy protestation the suppression, in the editions of the *Théorie des Probabilités* subsequent to the restoration, of the original dedication to the emperor formed a fitting commentary.

During the later years of his life, Laplace lived much at Arcueil, where he had a country-place adjoining that of his friend Berthollet. With his co-operation the Société d'Arcueil was formed, and he occasionally contributed to its *Memoirs*. In this peaceful retirement he pursued his studies with unabated ardour, and received with uniform courtesy distinguished visitors from all parts of the world. Here, too, he died, attended to the last by his physician Dr Majendie, and his mathematical coadjutor Bouvard, March 5, 1827, having nearly completed his seventy-eighth year. His last words were: "Ce que nous connaissons est peu de chose, ce que nous ignorons est immense."

Although commonly believed to have held atheistical opinions, Laplace refrained from giving any direct expression to them in his writings. His character, notwithstanding the vanity and egotism by which it was disfigured, had an amiable and engaging side. Young men of science found in him an active benefactor. His relations with these "adopted children of his thought" possessed a singular charm of affectionate simplicity; their intellectual progress and material interests were objects of equal solicitude to him, and he demanded in return only diligence in the pursuit of knowledge. M. Biot relates that, when he himself was beginning his career, Laplace introduced him at the Institute for the purpose of explaining his supposed discovery of equations of mixed differences, and afterwards showed him, under a strict pledge of secrecy, the papers, then yellow with age, in which he had long before obtained the same results, but which he had laid aside with a view to future development. This instance of abnegation is the more worthy of record that it formed a marked exception to Laplace's usual course. Between him and Legendre there was a feeling of "more than coldness," owing to his appropriation, with scant acknowledgment, of the fruits of the other's labours; and our celebrated countryman, Dr Thomas Young, counted himself, rightly or wrongly, amongst the number of those similarly aggrieved by him. With Lagrange, on the other hand, he always remained on the best of terms.

The extreme abstemiousness of his life, joined to a naturally good constitution, preserved Laplace from most of the infirmities incidental to old age. He was indeed obliged to use his eyes with precaution; but his powerful memory remained unimpaired, and it was not until within two years of his death that his health began to

¹ *Journal des Savants*, 1850.
² *Mém. Chém.*, tom. v. p. 848.

suffer from his severe application. He married a beautiful and amiable woman, and left a son, born in 1789, who succeeded to his title, and rose to the rank of general in the artillery.

It might be said that Laplace was a great mathematician by the original structure of his mind, and became a great discoverer through the sentiment which animated it. The regulated and persistent enthusiasm with which he regarded the system of nature was with him from first to last. It can be traced in his earliest essay, and it dictated the ravings of his final illness. By it his extraordinary analytical powers became strictly subordinated to physical investigations. To this lofty quality of mind he added a rare sagacity in perceiving analogies, and in detecting the new truths that lay concealed in his formulae, and a tenacity of mental grip, by which problems, once seized, were held fast, year after year, until they yielded up their solutions. In every branch of physical astronomy, accordingly, deep traces of his work are visible. "He would have completed the science of the skies," Fourier remarks, "had the science been capable of completion."

For a fuller account of the results achieved by him, the article ASTRONOMY, vol. ii p. 761, may be consulted, it need only be added that he first examined the conditions of stability of the system formed by Saturn's rings, pointed out the necessity for their rotation, and fixed for it a period (10^4 33m) differing by little more than a minute from that established by the observations of Herschel, that he detected the existence in the solar system of an invariable plane such that the sum of the products of the planetary masses by the projections upon it of the areas described by their radii vectors in a given time is always a maximum, made notable advances in the theory of astronomical refraction (*Mécanique*, tom. iv. p. 268), and constructed formulae, agreeing remarkably with observation, for the barometrical determination of heights (*Mécanique*, tom. iv. p. 324). His removal of the considerable discrepancy between the actual and Newtonian velocities of sound, by taking into account the increase of elasticity due to the heat of compression, would alone have sufficed to illustrate a lesser name. Molecular physics also engaged a large share of his attention, and he announced in 1824 his purpose of treating the subject in a separate work. With Lavoisier he made an important series of experiments on specific heat (1782-84), in the course of which the "ice calorimeter" was discovered; and they contributed jointly to the *Mémoire de l'Académie* (1781) a paper on the development of electricity by evaporation. Laplace was, moreover, the first to offer a complete analysis of capillary action based upon a definite hypothesis—that of forces "sensible only at inappreciable distances"—and he made strenuous but unsuccessful efforts to explain the phenomena of light on an identical principle. It was a favourite idea of his that chemical affinity and capillary attraction would eventually be included under the same law, and it was perhaps as much because it threatened an inroad on a cherished generalization as because it seemed to him little capable of mathematical treatment that the undulatory theory of light was distasteful to him.

The investigation of the figure of equilibrium of a rotating fluid mass engaged the attention of Laplace during the greater part of his long life. His first memoir was communicated to the *Académie* in 1778, when he was sixty-four years of age, his last in 1817, when he was eighty-eight. The results of his many papers on this subject—characterized by him as "un des points les plus intéressants du système du monde"—are embodied in the *Mécanique Céleste*, and furnish one of the most remarkable proofs of his extraordinary genius. Maclaurin, Legendre, and D'Alembert had furnished partial solutions of the problem, confining their attention to the possible figures which would satisfy the conditions of equilibrium. Laplace treated the subject from the point of view of the gradual aggregation and cooling of a mass, and demonstrated that the form which such a mass would ultimately assume must be an ellipsoid of revolution whose equator was determined by the primitive plane of maximum areas.

The honour of having brought almost to perfection the closely related problem of the attraction of spheroids must also be accorded to him. All the powers of analysis in the hands of the greatest masters replaced the old geometrical methods, and their superiority was soon evidenced by a succession of remarkable discoveries. Legendre, in 1778, extended Maclaurin's theorem concerning ellipsoids of revolution to the case of any spheroid of revolution where the attracted point, instead of being limited to the axis or equator, occupied any position in space; and Laplace, in his *Théorie du Mouvement et de la Figure Elliptique des Planètes* (un-

ished in 1784), effected a still further generalization by proving, what had been suspected by Legendre, that the theorem was equally true for any conical ellipsoids. Finally, in a celebrated memoir, *Théorie des Attractions des Sphéroïdes et de la Figure des Planètes*, published in 1785 among the *Paris Mémoires* for the year 1785, written, however, after the treatise of 1784, Laplace treated exhaustively the general problem of the attraction of any spheroid upon a particle situated outside or upon its surface.

The researches of Laplace and Legendre on the subject of attractions derive additional interest and importance from having introduced two powerful engines of analysis for the treatment of physical problems, Laplace's Coefficients and the Potential Function. The expressions for the attraction of an ellipsoid involved integrations which presented formidable difficulties; it was, therefore, with pardonable exultation that Laplace announced his discovery that the attracting force in any direction could be obtained by the direct process of differentiating a single function. He thereby translated the forces of nature into the language of analysis, and laid the foundations of the mathematical sciences of heat, electricity, and magnetism. This function, V , which received the name of potential from Green in 1828, and independently from Gauss in 1840, is defined as the sum of the masses of the molecules of the attracting body divided by their respective distances from the attracted point, or, in mathematical language—

$$V = \iiint \frac{\rho \, dx \, dy \, dz}{\{(x-a)^2 + (y-b)^2 + (z-\gamma)^2\}^{\frac{1}{2}}},$$

ρ being the density of the body at the point x, y, z , a, b, γ , the coordinates of the attracted point, and the limits of integration being determined by the form of the attracting mass. V is thus a function of a, b, γ , that is to say, depends for its value on the position of the point, and its several partial differentials with respect to these coordinates furnish the components of the attractive force. The integrations, however, could not in general be effected so as to express V in finite terms, but Laplace showed that V satisfied the partial differential equation

$$\frac{d^2 V}{dx^2} + \frac{d^2 V}{dy^2} + \frac{d^2 V}{dz^2} = 0,$$

which is still known as Laplace's equation. It is worthy of remark that it was not in this symmetrical form that the equation was discovered, but in the complicated shape which it assumes when expressed in polar coordinates—

$$\frac{d}{d\mu} \left\{ (1-\mu^2) \frac{dV}{d\mu} \right\} + \frac{1}{1-\mu^2} \frac{d^2 V}{d\theta^2} + \frac{d^2 V}{d\phi^2} = 0,$$

where μ is substituted for $\cos \theta$. This differential equation forms the basis of all Laplace's researches in attractions, and makes its appearance in every branch of physical science.

The expressions which are known as Laplace's coefficients, a name first given to them by Dr Whewell, occupy a distinguished place in modern analysis. They were first introduced in their generality by Laplace in the memoir on attractions, 1785, above referred to, which is, to a great extent, reprinted in the third book of the *Mécanique Céleste*, but Legendre, in a celebrated paper entitled *Recherches sur l'Attraction des Sphéroïdes homogènes*, printed in the tenth volume of the *Œuvres de Laplace*, 1783, had previously made use of them, and proved some of their properties, in the simplified form which they assume with one instead of two variables. They may be defined as follows. If two points in space are determined by their polar coordinates, r, θ, ϕ , and r', θ', ϕ' , T the reciprocal of the distance between them is expressed in terms of those coordinates by

$$\left[r^2 - 2rr' \left\{ \mu\mu' + \sqrt{1-\mu^2} \sqrt{1-\mu'^2} \cos(\omega-\omega') \right\} + r'^2 \right]^{-\frac{1}{2}},$$

where μ and μ' are written for $\cos \theta$ and $\cos \theta'$ respectively. This expression may be expanded in a series of the form

$$\frac{1}{r} \left[P_0 + P_1 \frac{r'}{r} + P_2 \frac{r'^2}{r^2} + \dots + P_n \frac{r'^n}{r^n} + \dots \right],$$

where P_0, P_1, \dots, P_n are Laplace's coefficients of the orders 0, 1, \dots, n . They are rational integral functions of $\mu, \sqrt{1-\mu^2} \cos \phi$, and $\sqrt{1-\mu^2} \sin \phi$, and are precisely the same functions of $\mu', \sqrt{1-\mu'^2} \cos \phi'$ and $\sqrt{1-\mu'^2} \sin \phi'$; or, in other words, of the rectangular co-ordinates of the two points divided by their distances from the origin. The general coefficient P_n is of n dimensions in these quantities, and its maximum value is known to be unity, so that the above written series will be convergent if r' is greater

¹ See *Monthly Notices of the Astronomical Society*, xxvii. p. 311. They are also included in the more general expression "Spherical harmonics" ("Fonctions sphériques," "Kugelfunktionen").

² *Annales de Chimie et de Physique*, 1816, tom. iii. p. 238.

than, it can be easily proved that T satisfies Laplace's differential equation—

$$\frac{d}{d\mu} \left\{ (1-\mu^2) \frac{dT}{d\mu} \right\} + \frac{1}{1-\mu^2} \frac{d^2T}{d\omega^2} + \frac{d^2T}{d\omega^2} + \frac{d^2T}{d\omega^2} = 0,$$

and if for T we substitute the expanded form, we obtain the general differential equation of which Laplace's coefficients are particular integrals—

$$\frac{d}{d\mu} \left\{ (1-\mu^2) \frac{dP_\mu}{d\mu} \right\} + \frac{1}{1-\mu^2} \frac{d^2P_\mu}{d\omega^2} + \mu(\mu+1)P_\mu = 0$$

Expressions which satisfy this equation are referred to as Laplace's functions; they include as a particular case the coefficients, which are, as we have seen, certain definite functions of the spherical surface coordinates of the two points. If

$$\alpha = \mu\mu' + \sqrt{1-\mu^2}\sqrt{1-\mu'^2} \cos(\omega - \omega'),$$

the coefficients become functions of α alone, and it was in this form that Laplace first introduced them. One of the fundamental properties of Laplace's functions, known as Laplace's theorem is that, if Y_1 and Z_1 be two such functions, μ and ω' being whole numbers and not identical, then

$$\int_0^\pi \int_0^{2\pi} Y_1 Z_1 d\omega' d\omega = 0$$

Again, if Y_1 is the same function of μ' and ω' , that Y_2 is of μ and ω , we have the important relation

$$Y_1' = \frac{2+1}{2\pi} \int_0^\pi \int_0^{2\pi} Y_2 P_1 d\omega' d\omega$$

But the property on which their utility in physical researches chiefly depends is that every function of the coordinates of a point on a sphere can be expanded in a series of Laplace's functions.¹

In the figure of the earth, the theory of attractions, and the sciences of electricity and magnetism this powerful calculus occupies a prominent place. Gauss in particular has employed it in the calculation of the magnetic potential of the earth, and it has recently received new light from Professor Clerk Maxwell's interpretation of harmonics with reference to poles on the sphere.

Laplace, always profound rather than elegant, nowhere displays the massiveness of his genius so conspicuously as in the theory of probabilities. The science which Pascal and Fermat had initiated he brought very nearly to perfection, but the demonstrations are so involved, and the causation in the chain of reasoning so frequent that the *Théorie Analytique* is to the best mathematicians a work requiring the most arduous study. The theory of probabilities, which Laplace describes as common sense expressed in mathematical language, first attracted his attention from its importance in physics and astronomy, and he applies his theory not only to the ordinary problems of chance, but also to the inquiry into the causes of phenomena, vital statistics, and future events.

The device known as the method of least squares, for reducing numerous equations of condition to the number of unknown quantities to be determined, had been adopted as a practically convenient rule by Gauss and Legendre; but Laplace first treated it as a problem in probabilities, and proved by an intricate and difficult course of reasoning that it was also the most advantageous, the mean of the probabilities of error in the determination of the elements being thereby reduced to a minimum.

The method of generating functions, the foundation of his theory of probabilities, Laplace published in 1779; and the first part of his *Théorie Analytique* is devoted to the exposition of the principles, which in their simplest form consist in treating the successive values of any function as the coefficients in the expansion of another function with reference to a different variable. The latter is therefore called the generating function of the former. A direct and an inverse calculus is thus created, the object of the former being to determine the coefficients from the generating function, of the latter to discover the generating function from the coefficients. The one is a problem of interpolation, the other a step towards the solution of an equation in finite differences. The method, how-

ever, is now obsolete from the more extended facilities afforded by the calculus of operations.

The first formal proof of Lagrange's theorem for the development in a series of an implicit function was furnished by Laplace, who gave to it an extended generality. He also showed that every equation of an even degree must have at least one real quadratic factor, reduced the solution of linear differential equations to definite integrals, and furnished an elegant method by which the linear partial differential equation of the second order might be solved. He was also the first to consider the difficult problems involved in equations of mixed differences, and to prove that an equation in finite differences of the first degree and the second order might always be converted into a continued fraction.

In 1812, the works of Laplace being nearly out of print, his widow was about to sell a farm in order to procure funds for a new impression, when the Government of Louis Philippe took the matter in hand. A grant of 40,000 francs having been obtained from the chamber, a national edition was issued in seven 4to vols., bearing the title *Œuvres de Laplace*, 1843-47. The *Mécanique Céleste* with its four supplements occupies the first 5 vols., the 6th contains the *Système du Monde*, and the 7th the *Théorie des Probabilités*, to which the more popular *Essai Philosophique* forms an introduction. Of the four supplements added by the author, 1816-25, he tells us that the problems in the last were contributed by his son. An enumeration of Laplace's memoirs and papers (about one hundred in number) is rendered superfluous by their embolism in his principal works. The *Théorie des Prob.* was first published in 1812, the *Essai* in 1814, and both works as well as the *Système du Monde* went through repeated editions. Laplace's first separate work, *Théorie du Mouvement et de la Figure Elliptique des Planètes*, 1784, was published at the expense of President Richard de Saron.

The *Précis de l'Histoire de l'Astronomie*, 1801, formed the first book of the 5th edition of the *Système du Monde*. An English translation, with copious elucidatory notes, of the first 4 vols of the *Mécanique Céleste*, by Dr Bowditch, was published at Boston, U.S. 1829-39, in 4 vols. 4to; a compendium of certain portions of the same work by Mr Somerville appeared in 1881, and the *Théorie des Prob.* to the first 2 vols. by Burkhardt at Berlin in 1801. English translations of the *Système du Monde* by Mr Pond and Mr Harte were published, the first in 1809, the second in 1830. An edition entitled *Les Œuvres Complètes de Laplace*, 1878, &c., which is to include the whole of his memoirs, is now in course of publication under the auspices of the Academy of Sciences. The *Essai Philosophique* has already appeared complete in the first book of the *Mécanique Céleste*.

Scanty notices of Laplace's life will be found in Fontaine's *Éloge*, June 15, 1829, in the funeral oration of Poisson, and Arago's *Résumé*, 1842, translated amongst his *Biographies* by Admiral Smyth and Mr Grant. His astronomical works are contained in the *Tables des Éléments des trois Corps et Giant's Hist. of Astronomy*. For Laplace's functions see Dr E. Heine, *Handbuch der Kugelfunctionen*, Berlin, 1861, John H. Pratt, *A Treatise on Attraction*, 1886; Todhunter's *Elementary Treatise on Laplace's Functions*, 1876, and *History of the Mathematical Theories of Attraction*, 1879; N. M. Ferrers's *Elementary Treatise on Spherical Harmonics*, 1877; and L. Schläfli, *Die neuer Heineschen Kugelfunctionen*, 1881. Consult also Thomson and Tait, *Treatise on Natural Philosophy*, 1879, p. 141; Clerk Maxwell, *Treatise on Electricity*, chap. ix.; Professor Niven in *P.M. Trans.*, 1879, p. 379; Dufrenoy in *Oeuvres*, xvi. p. 35; and Jacob, vol. II. p. 223, xvi. p. 62. Some of Laplace's views on the theory of probabilities are simplified in Lacroix's *Traité élémentaire du Calcul des Probabilités* and De Morgan's *Essay*, published in Lardner's Cabinet Cyclopædia. For the history of the subject see *A History of the Mathematical Theory of Probability*, by Isaac Todhunter, 1865. (A. M. C.)

LAPLAND, or LAPPLAND, is the north-west portion of the continent of Europe, bounded W., N., and E. by the North Atlantic, the Arctic Ocean, and the White Sea, and S. partly by the White Sea, but mainly by a conventional line. It includes the northern parts of Norway, Sweden, and Finland, and the western part of the Russian government of Archangel. A line drawn from the mouth of the Salten Fjord on the Norwegian coast to the mouth of the Ponoi on the White Sea, practically identical with the 61st parallel of north latitude, measures 700 miles. Of Russian Lapland only a very small portion lies outside of the Arctic circle; but in Swedish Lapland the southern confines descend as low as 64°. According to Frijs (in Petermann's *Mitth.*, 1870), the total area of Lapland may be estimated at 153,200 square miles, of which 15,073 miles belong to Norway, 48,898 to Sweden, 26,575 to Finland, and 61,654 to Russia.

Lapland is merely the land of the Lapps or Laps, and does

¹ This equation was first integrated by Mr Hargreave, *Philosophical Transactions*, 1841, p. 76, and it has since been successfully treated by Professor Boole, *Canab. and Dub. Math. Journ.*, vol. I. p. 10, and Professor Deukin, *Phil. Trans.*, 1857, p. 43. See Boole's *Differential Equations*, §3 et seq. p. 458.

² The proof of this theorem in its full generality has given rise to much controversy, where, however, the form of the function is rational and integral—the only case of practical importance—no difficulty is experienced. The reader is referred to two papers by Ivory in the *Phil. Trans.*, 1812 and 1822; Poisson, *Théorie Mathématique de la Chaleur*; L. Dirichlet, in *Oeuvres*, vol. xvi.; and O. Bonnet, in *Lacroix's Journal*, vol. xvi.

not constitute a geographical unity. The Scandinavian portion presents the usual characteristics of the mountain plateau of that peninsula,—on one side the bold headlands, fjords, deep-grooved valleys, and glaciers of Norway, on the other the long mountain lakes and lake-fed rivers of Sweden. On the Swedish side the Lapp borders only come down to within from 30 to 40 miles of the coast, where the rivers begin to lose the character of mountain streams. With the exception of Torne Lappmark, which is really part of Scandinavia, Finnish and Russian Lapland may be generally described as comparatively low country, broken by detached hills and ridges, one of which, the Umbek Dundar, attains an elevation of 2500 feet. Rivers and lakes abound. In the north of the Finnish region lies the great Enare or Inara (formerly Upper Imandra) Lake, with an area of 1147 square miles; and the south is traversed by the countless head-waters of the Kemi, which falls into the Gulf of Bothnia to the east of the Swedish frontier. The largest of the rivers of Russian Lapland—or, as it is often called, the Kola peninsula—is the Tulom, which falls into the Arctic Ocean, and others of importance are the Pasvig, the Pono, and the Verege. Lake Imandra, or Imandra (in Lappish Aven), is about 65 miles long by 3 or 4 broad, (Lake Nouljaur is 35 miles by 7; and Quollejaur, Umbocor, Konjarvi, and Pasjarvi are all of considerable extent.) An opinion was long prevalent that there was a natural boundary of the most striking kind between the Arctic coast of Norwegian and that of Russian Lapland,—that to the east of Jacob's river the harbours or fjords were ice-bound for six months of the year, while the influence of the Gulf Stream never allowed those to the west to be frozen. This, however, is not the case. The principal harbours on the Murman coast eastward to the mouth of the White Sea remain open like those of Norway.

Though Lapland contains vast stretches of desolate tundra and dreary swamp, the country as a whole has a certain quiet beauty, and in the wilder districts the scenery is wonderfully various in colour and form. "It is hardly possible," says Lieutenant Temple in *Proc. Roy. Geog. Soc.* 1880, "to conceive a greater contrast to the ice-bound regions which lie between the same parallels in the western hemisphere." And, though it gives little scope for husbandry, Lapland is richly furnished with much that is serviceable to man. Not to mention the iron and copper mines, it still possesses great store of timber, pine and spruce and birch; though fruit trees yield no fruit, there is abundance of edible berries; the rivers and lakes abound with salmon, trout, perch, and pike; myriads of water-fowl, ptarmigan, partridges, and capercaillie breed within its borders; and the cod, herring, halibut, and Greenland sharks of its seas give occupation to thousands of fishermen.

The chief characteristics of Lapland is its Arctic climate and the distribution of daylight and darkness. In the northern parts the longest day and the longest night last for three months each, and through the greater part of the country the sun does not set at midsummer or rise at midwinter.

The following calendar of the climate after *Lestadius* relates more particularly to the northern districts of Swedish Lapland, but is more or less applicable to a large part of the country:—*January*: cold and clear; no day-light; about 4 o'clock the "rose of dawn"; mean temperature, 0° 50 Fahr. *February*: cold, snow and wind; day-light from 6-7 A.M. to 6-8 P.M.; mean temperature, -1° 4. *March*: heat of the sun begins to modify the cold; steady snow-fall, snow begins to appear; mean temperature, 11° 8. *April*: weather variable; snow and wind, birds of passage, crows, and snow sparrows appear, snow melts from the branches; mean temperature, 26° 8. *May*: the first month in the year; spring flowers in blossom; bird life abundant; sowing season; temperature often reaches 68° during the day; seed is often "brinded" eight days after it is sown; mean temperature, 36° 5. *June*: ice breaks up on lakes and rivers; woods rush into leaf; about the 20th continual day; mean temperature, 49° to 50°. *July*: quite warm, mountain floods; grain shoots into ear; fishing and hunting; mos-

quitos, cloudberries ripe; mean temperature, 56°. *August*: much rain, harvest, by the 10th strong frosts at night; mean temperature, 56°. *September*: short days; rain, wind, sleet; raspberries, strawberries, bilberries, &c., ripe, fall of the leaf; mean temperature, 41°. *October*: "golden pudding time"; slaughter of reindeer and laying up of meat store for winter; mean temperature, 27° 50. *November*: full winter; lakes frozen over; fishing still prosecuted with ice-netts; mean temperature, 12° 24. *December*: much like January, hunting of bears, wolves, &c.; mean temperature, 1°.

The population of Lapland has been considerably recruited in modern times by immigrants from the south, but the country is still very sparsely peopled, and the Lapps still predominate. There are no towns, and the villages are not only few and insignificant, but often hardly less nomadic than the people, being shifted according to exigencies of fodder or fuel. Hammerfest, the "most northern town of the European continent," has only 2100 inhabitants, and Kola (formerly Malmö), the principal settlement in Russian Lapland, does not now exceed 500.

The Lapps.—The Lapps (Swed., *Lappar*; Russian, *Лопари*; Norw., *Finner*) call their country *Sámo* or *Samo*, and themselves *Samelats*—names almost identical with those employed by the Finns for their country and race, and probably connected with a root signifying "dark" (see Donner, *Verg. Wort der Finn.-Ugr. Sprachen*, Hels., 1876). Lapp is almost certainly a nickname imposed by foreigners, although some of the Lapps apply it contemptuously to those of their countrymen whom they think to be less civilized than themselves.¹

In Sweden and Finland the Lapps are usually divided into fisher, mountain, and forest Lapps. In Sweden the first class includes many impoverished mountain Lapps. As described by *Lestadius* (1827-32), their condition was a very miserable one; but since his time matters have much improved. The principal colony has its summer quarters on the Stoor-Lule Lake, possesses good boats and nets, and, besides catching and drying fish, makes money by the shooting of wild fowl and the gathering of eggs. When he has acquired a little means it is not unusual for the fisher to settle down and reclaim a bit of land. The mountain and forest Lapps are the true representatives of the race. In the wandering life of the mountain Lapp his autumn residence, on the borders of the forest district, may be considered as the central point, it is there that he erects his *njalla*, a small wooden store-house raised high above the ground by one or more piles. At the beginning of November, a little sooner or later, he begins to wander south or east into the forest land, and in the course of the winter he may visit, not only such places as Jockmolok and Arjeplog, but even Gelle, Upsala, or Stockholm. About the beginning of May he is back at his *njalla*, but as soon as the weather grows warm he pushes up to the mountains, and there throughout the summer pastures his herds and prepares his store of cheese. By autumn or October he is busy at his *njalla* killing the surplus reindeer bulls and curing meat for the winter. From the mountain Lapp the forest (or, as he used to be called, the spruce-fir) Lapp is mainly distinguished by the narrower limits within which he pursues his nomadic life. He never wanders outside of a certain district, in which he possesses hereditary rights, and maintains a series of camping grounds which he visits in regular rotation. In May or April he lets his reindeer loose, to wander as they please; but immediately after midsummer, when the mosquitoes become troublesome, he goes to collect them. Catching a single deer and "belling" it, he drives it through the wood; the other deer, whose instinct leads them to gather into herds for mutual protection against the mosquitoes, are

¹ The most probable etymology is the Finnish *lappu*, and in this case the meaning would be the "land's-end folk."

attracted by the sound. Should the summer be very cool and the mosquitoes few, the Lapp finds it next to impossible to bring the creatures together. About the end of August they are again let loose, but they are once more collected in October, the forest Lapp during winter pursuing the same course of life as the mountain Lapp.

In Norway there are three classes—the sea Lapps, the river Lapps, and the mountain Lapps, the first two settled, the third nomadic. The mountain Lapps have, on the whole, a rather ruder and harder life than the same class in Sweden. About Christmas those of Kautokeino and Karasjokk are usually settled in the neighbourhood of the churches, in summer they visit the coast, and in autumn they return inland. Previous to 1852, when they were forbidden by imperial decree, they were wont in winter to move south across the Russian frontiers. It is seldom possible for them to remain more than three or four days in one spot. Flesh is their favourite, in winter almost their only food, though they also use reindeer milk, cheese, and rye or barley cakes. The sea Lapps are in some respects hardly to be distinguished from the other coast dwellers of Finmark. Their food consists mainly of cooked fish. The river Lapps, many of whom, however, are descendants of Quains or Finns proper, breed cattle, attempt a little tillage, and entrust their reindeer to the care of mountain Lapps.

In Finland there are comparatively few Laplanders, and the great bulk of them belong to the fisher class. Many of them are settled in the neighbourhood of the Enare Lake. In the spring they go down to the Norwegian coast and take part in the sea fisheries, returning to the lake about midsummer. Formerly they found the capture of wild reindeer a profitable occupation, using for this purpose a palisaded avenue gradually narrowing towards a pitfall.

The Russian Lapps are also for the most part fishers, as is natural in a district with such an extent of coast and such a number of lakes, not to mention the advantage which the fisher has over the reindeer keeper in connexion with the many fests of the Greek Church. They maintain a half nomadic kind of life, very few of them having become regular settlers in the Russian villages. It is usual to distinguish them according to the district of the coast which they frequent, as Murman (Murmanski) and Terian (Terski) Lapps. A separate tribe, the Filmanns, i.e., Finnmans, nomadize about the Pazzyets, Motoff, and Petchenga tundras, and retain the peculiar dialect and the Lutheran creed which they owe to a former connexion with Sweden. They were formerly known as the "twice and thrice tributary" Lapps, because they paid to two or even three states—Russia, Denmark, and Sweden.

The ethnographical position of the Lapps has not been clearly determined, though it is evident they can no longer be classified with the Finns. They are, as has been seen, far from a numerous people, and within the historical period they have considerably recruited themselves from neighbouring races. Shortness of stature¹ is their most obvious characteristic, though in regard to this much exaggeration has prevailed. Duben (p. 167) found an average of 4·9 feet for males and a little less for females; Mantegazza, who made a number of anthropological observations in Norway in 1879, gives 5 feet and 4·75 feet respectively (*Archivio per l'antrop.*, 1880). Individuals much above or much below the average are rare. The body is usually of fair proportions, but the legs are rather short, and in many cases somewhat bandy. Dark, swarthy, yellow, copper-coloured are all adjectives employed by competent observers to describe their complexion,—the truth being that their habits of life do not conduce either to the preservation or

display of their natural colour of skin, and that some of them are really fair, and others, perhaps the majority, really dark. The colour of the hair, too, ranges from blonde and reddish to a bluish or greyish black, and the eyes are black, hazel, blue, or grey. The shape of the skull is the most striking peculiarity of the Lapp. He is the most brachycephalous type of man in Europe, perhaps in the world.² According to Virchow, the women in width of face are more Mongolian-like than the men, but neither in men nor women does the opening of the eye show any true obliquity. In children the eye is large, open, and round. The nose is always low and broad, more markedly retoused among the females than the males. Wrinkled and puckered by exposure to the weather, the faces even of the younger Lapps assume an appearance of old age. The muscular system is usually well developed, but there is deficiency of fatty tissue, which affects the features (particularly by giving relative prominence to the eyes) and the general character of the skin. The thinness of the skin, indeed, can but rarely be paralleled among other Europeans. Among the Lapps, as among other lower races, the index is shorter than the ring finger.³

The Lapps are a quiet, inoffensive people. Crimes of violence are almost unknown among them, and the only common breach of law is the killing of tame reindeer belonging to other owners. In Russia, however, they have a bad reputation for lying and general untrustworthiness, and drunkenness is well-nigh a universal vice. In Scandinavia laws have been directed against the importation of intoxicating liquors into the Lapp country since 1723.

Superficially at least the great bulk of the Lapps have been Christianized,—those of the Scandinavian countries being Protestants, those of Russia members of the Greek Church. In education the Scandinavian Lapps are far ahead of their Russian brethren, to whom reading and writing are arts as unfamiliar as they were to their pagan ancestors. The general manner of life is patriarchal. The father of the family has complete authority over all its affairs; and on his death this authority passes to the eldest son. Parents are free to disinheritor their children; and, if a son separates from the family without his father's permission, he receives no share of the property except a gun and his wife's dowry.⁴

By the very circumstances of their position the Lapps are of necessity conservative in most of their habits, many of which can hardly have altered since the first taming of the reindeer. But the strong current of mercantile enterprise has carried a few important products of southern civilization into their huts. The lines in which Thomson describes their simple life—

The reindeer form their riches, these their tents,
Their robes, their beds, and all their homely wealth
Supply; their wholesome fare and cheerful cups—

are still applicable in the main to the mountain Lapps; but even they have learned to use coffee as an ordinary beverage, and to wear stout Norwegian cloth (*vaadnal*).

Linguistically the Laps belong to the great Uralo-Altaic family, the similarity of their speech to Finnish is evident on the surface. It is broken up into very distinct and even mutually unintelligible dialects, the origin of several of which is, however, easily found in

¹ Bertillon found in one instance a cephalic index of 94. The average obtained by Pruner Bey was 84·7, by Virchow 82·5.

² See Retzius, *Antrop. Kraser* (Stockholm, 1878); Virchow, in *Arch. für Anthrop.*, tom. iv., 1870; papers by Virchow (1874), Hagenbeck and Europeans (1875), and Van der Horst (1878), in *Zeitschrift für Ethnologie*, and by Gázdáry (1888) and Pruner Bey (1884), in *Mémoires de la Soc. d'Anthrop.* Bertillon, in *Bulletin de la Revue d'Anthrop.*, has given a comparison of the craniology of the Lapps with that of Persians, Kafirs, and New Caledonians.

⁴ A valuable paper by Ephimenco, on "The Legal Customs of the Lapps, especially in Russian Lapland," appears in vol. vii. of the *Mém. of Russ. Geog. Soc.*, Ethnog. Section, 1878.

¹ Hence they have been supposed by many to be the originals of the "little folk" of Scandinavian legend.

the political and social dismemberment of the people. Duben distinguishes four leading dialects, but a much greater number are recognizable. In Russian Lapland alone there are three, due to the influence of Norwegian, Karelian, and Russian (Lonnqvist, *Adat Säs Säs, Penttinen*, vol. iv). "The Lapas," says Castren, "have long, the misfortune to come into direct contact with foreign languages, and consequently they have been very much changed, and consequently it has not only adopted an endless number of foreign words, but in many grammatical aspects fashioned itself after foreign models." That it began at a very early period to emulch itself with Scandinavian words is shown by the use it still makes of forms belonging to a linguistic stage older even than that of Icelandic. "The Lapas," says Castren, "have been so much changed for the purpose of discovering what stage of culture the people had reached before their contact with the Norse. Agricultural terms, the names of the metals, and the word for smith, are all of Scandinavian origin, and the words for "taming" and "milk" would suggest that the southern strangers taught the Lapps how to tame and milk their animals. The fact that the word for "milk" in this creature must always have held in their estimation is evident from the existence of more than three hundred native render words

The Lapp tongue was long ago reduced to writing by the missionaries, but very little has been printed in it except school-books and religious works. A number of popular tales and songs, indeed, have been taken down from the lips of the people by Fjellner, Gionlaan and others. J. A. Frjns, professor of Lapp in the university of Uppsala, has published a *Lappsk språk och folksång*, containing *lapp eevnir, ordspök, og skän, Christnams 1856*, and *Lappsk mytologi, eevnir og folksäng*, Christnams, 1871. See also G Donner, *Læser der Lappen*, Helsingfors, 1876. The songs are extremely similar to those of the Finns, and a process of mutual borrowing seems to have gone on. In one of the sign-like pieces—Pishan-Peshan's son—these are so distinctly reminiscent of those of the Eskimo, that probably the tale of the latter must have been the very origin of the song. The Sun, is full of quaint folklores about the taming of the reindeer. Giants, as well as a blind or one-eyed monster, are fitquently introduced, and the *Asopik* fable is not without its representatives. Grammars of the Lapp have been published by Fjellstom (1788), Leenz (1798), Rask (1838), Stockström (1840); lexicons by Frjns (1856), and others. The Lapps are able to speak one or even two of the neighbouring tongues.

The reputation of the Lapidars for skill in magic and divination is of very early date, and in Finland is not yet extinct. When Erik Blood-axe, son of Harold Haarfager, visited Ramezund in 932, he found Grunhild, daughter of Asa Tote, living among the Lapps, to whom she had been betrothed, but who had been so trained in witchcraft, and even the Terrible of Russia sent for magicians from Lappland to explain the cause of the appearance of a comet. One of the powers with which they were formerly credited was the raising of winds by the blowing of the Lapp-whistle. Edward Rieu, "our tyrant hanging in a whip." When they lose one of these they may raise tolerable winds. When they lose another the winds are more vehement; but by losing the third they raise storms tempestuous as in old times they were accustomed to ravage the coast. The Lapps are very superstitious, and their superstitions are very familiar in English with allusions to "Lapland witches," it appears that the art, according to native custom, was in the hands of the women. During his divination the wizard fell into a state of trance or ecstasy, his soul being held to run about at large to pursue the evil spirits, and he was then seen to rise up in the air, oval in shape, and made of wood, 1 to 4 feet in length. Over the upper surface was stretched a white-dressed reindeer skin, and at these corners (so to speak) hung a variety of charms—rinds of wool, bones, teeth, claws, etc. The area was divided into several spaces, often into four, and each space was filled with a different kind of material. A variety of figures and conventional signs were drawn in the several compartments: the sun, for instance, is frequently represented by a square and a stroke from each corner, Thor by two hammers placed crosswise, and in the more modern specimens symbols for Christ, the Virgin Mary, and the Virgin Mary. The wizard, after the divination was laid on a definite spot, the drum beaten by a hammer, and conclusions drawn from the position taken up by the spirit. Any Lapp who had attained to manhood could in ordinary circumstances consult the drum for himself, but in matters of unusual importance the professional wizard (shud, noda, or noda) had to be called in.

Lapps have a dima tradition that their ancestors lived in a far eastern land, and tell true stories of their conflicts with Norsemen and Karahans. But no answer can be obtained from them to the questions naturally put by the historian in regard to their early distribution and movements. By many it has been maintained that they were formerly spread over the whole of the Scandinavian peninsula, and they have even been considered by some as the remnants of that primal race of cave-dwellers which hunted the reindeer over the snow-fields of central and western Europe. But much of the evidence adduced for these

theories is highly questionable. The contents of the so-called Lapps' graves found in various parts of Scandinavia are often sufficient in themselves to show that the appellation must be a misnomer, and the syllable Lap or Lapp found in many names of places can often be proved to have no connexion with the Lapps. Nothing more can be affirmed with certainty than that the area occupied or visited by the Lappe once extended farther south (in Russia as far, it would appear, as Lake Ledge), and that they already occupied their present position in the north of Russia, as is attested in the history. According to Duben the name has been mentioned in the century—in the *Finska Neger*, composed about 1200, in Saxo Grammaticus, and in a papal bull of date 1230, but the people are probably to be identified with those Funs of Tacitus whom he describes as wild hunters with skins for clothing and rude huts as only means of shelter, and certainly with the Skirphindus of Procopius (*Procop.*, i. 15), the Scythini of Paulus Wamandrus, and the Scythi of the *Geographia* of Ptolemy. Some of the details given by Procopius, in regard for instance to the treatment of infants, show that his informant was acquainted with certain characteristic customs of the Lappe.

In the 9th century the Norsemen from Norway began to treat their feebler northern neighbours as a subject race. The wealth of Ötär,—"northern of the northmen,"—whose native has been preserved by King Alfred, consisted mainly of an hundred of those deer they call hrens, and an tribute paid by the natives, and the Norsemen, in return, gave them the right to hunt and to collect contributions from the Fins (the Lapps) recognised by Harold Harfager. So much wealth was attached to this source of wealth that as early as 1050 strangers were excluded from the futaude of Funnaak, and a kind of coast-guard prevented their intrusion. Meantime the Karelians were pressing on the eastern Lapps, and in the course of the 11th century the rulers of Novgorod began to treat the Lapps as a Norseman's subject race. The ground-swell of the Tartar invasion drove the Karelians westward in the 13th century, and for many years even Funnaak was so unsettled that the Norsemen received no tribute from the Lapps. At length in 1326 a treaty was concluded between Norway and Russia by which the supremacy of the Norwegians over the Lapps was acknowledged, and the Lapps were to pay tribute to the King of Saa, and the supremacy of the Russians over the Karelians as far as Lyngen and the Malselv. The relations of the Lapps to these more powerful neighbours were complicated by the rivalry of the different Scandinavian kingdoms. After the disruption of the Calmar Union (1623), Sweden began to assert its rights with vigour, and in 1696 the treaty of Tusula between Sweden and Russia was signed, by which the Lapps were divided between eastern Russia, Bothnia, and Väranger shall pay their due to the king of Sweden." It was in vain that Christian IV of Denmark visited Kola and exacted homage in 1609, and every year sent messengers to protest against the collection of his tribute by the Swedes (a custom which continued down to 1836). Charles of Sweden took the title of "King of the Lapps" in 1657, and in the same year he asserted his power over all Scandinavian Lapland. By the peace of Karlskrona (1657) Gustavus Adolphus gave up the Swedish claim to Funnaak; and in 1761 mutual renunciations brought the relations of Swedish and Norwegian (Danish) Lapland to their present position. Meanwhile Russian influences had been spreading westward; and in 1721 the Russian Emperor Peter the Great had annexed Finland, he also added to his dominions the whole of Finnish Lapland to the east of the Muonio and the Konaanus.

The Lapps have had the ordinary fate of a subject and defenceless people; they have been afflicted with little regard to their own interests or inclinations. The example set by the early Norwegians was followed by the Swedes, a peculiar class of adventure hunters, the Bickarlars (from *Bickar*, "trade") began in the sixteenth century to farm the land and to receive the extensive privileges from the king, grew to great wealth and influence. In 1606 there were twenty-two Bickarlars in Tornio, seventeen in Luleå, sixteen in Piteå, and sixty-six in Umeå Lappmark. They are regularly spoken of as having or owning Lapps, whom they hire out, and dispose of as they please. The Lapps are not only the property of the Bickarlars, but followed much the same course. The very institution of the Solovets monastery, intended by St Tryphon for the benefit of the poor neglected pagans, turned out the occasion of much injustice towards them. By a charter of Ivan Vasilievitch (November 1569), the Lapps were assigned to the Solovets monastery, and to the Metol and Petchenga districts, and they soon sought to extend their control over those not legally assigned to them (Ephraem etc.). Other monasteries in distant parts of the empire were gifted with similar proprietary rights and the supplantation of the Lapps followed. The concession to which the Lapps were subjected.

It is long, however, since these abuses were abolished; and in Scandinavia more especially the Lapps of the present day enjoy the advantages resulting from a large amount of philanthropic legislation on the part of their rulers. There seems to be no fear of their becoming extinct, except it may be by gradual amalgamation with

their more powerful neighbours. The aggregate number in all Lapland is estimated at 27,000. According to official statistics the Swedish Lappe increased from 6617 in 1880 to 6702 in 1870. In Norway there were 14,464 in 1846, 17,178 in 1866. For Russia and Finland the numbers were given in 1859 as 1200 and 2153, and according to Rehnstedt the whole number in Russia is not very more than 3000. The number of rander possessed by the whole people is estimated at 843,000.

Gustaf von Urban's *Om Lappländ och Laparna* (Stockh., 1878) is the fullest and most systematic work on its subject. It gives a list of more than two hundred authorities. See also Söderberg, *Lapponia* (Frankf., 1879, English version, Oxford, 1874), for long the standard book. Regard, *Yngste de Lapponer* (Oslo, often reprinted, in Fikerton, vol. 1), Hagström, *Redskrift öfver de i Ull Skogarna Bönsa Lapponer*, Stockholm, 1747; Loom, *Antarctica oder Finlands Lapponer*, Copenhagen, 1767, extremely important, in Danish and Latin; Arentz, *Antarktis durch Jessoen, Berlin, 1804*; Lesnaffin, *Journal*, Stockholm, 1811; Leopold von Buch, *Reise durch Norwegen und Lappland*, Berlin, 1849; Bayly's *Taylor, Northern Travel*, London, 1868; Guntter, *Nordlands Reise* (Hels., 1852-58, German; Knud, St. Petersburg, Stockholm, 1869; with *Handbuch-Reise*, Christ., 1869, of great value; Frits, *An journey* (1867); *Pravoslav, etc.*, Christ., 1871; Arentz, *Reise nach Lappland*, Leipzig, 1874; Nordenskiöld-Quarsten, *Lapponien & Lappland*, St. Petersburg, 1874; *Reise* by Kallstén, etc., for the Anthropological Exhibition at Moscow, 1877; Moscow, 1878; Rehnstedt, *Lapland*, etc., Freiburg, 1878; De Quillat, *Land of the Midnight Sun*, London, 1881; Edward Rieu, *The White Sea Peninsula*, London, 1882.

(L. A. W.)

LA PORTE, chief city of La Porte county, Indiana, U.S., is situated at the intersection of three railways, 12 miles south of Lake Michigan, and about 60 miles south-east of Chicago. Surrounded by a fertile agricultural region, it carries on a considerable trade, and has manufacturing of agricultural implements, foundries, and various mills. The vicinity has become a favorite summer residence, on account of its beautiful lakes, which in winter supply large quantities of clear ice for the Chicago and southern markets. The population in 1880 was 6195.

LAPPENBERG, JOHANN MARTIN (1794-1865), a German historical writer, was born July 30, 1794, at Hamburg, where his father held a good official position; early in life he began to study medicine, and afterwards history, at Edinburgh. The latter pursuit he continued in London and at the universities of Berlin and Göttingen, graduating as doctor of laws of Göttingen in 1816. He was forthwith sent by the Hamburg senate as resident minister to the Prussian court, where he remained till 1823, when he became keeper of the Hamburg archives, an office in which he had the amplest opportunities for the cultivation and exercise of those habits of laborious and critical research on which his highly respectable reputation as an historian rests. He continued to hold this post until 1863, when a serious affection of the eyes compelled him to resign. In 1850 he had the honour of representing Hamburg at the Frankfurt conference. His death took place on November 28, 1865.

Lappenberg's most important contribution to literature, and that by which he is best known outside of Germany, was his *Geschichte von England* (2 vols., Hamburg, 1834-37), which was translated by Thorpe (1848-57) and continued by Pauli (from 1160). His other works include a continuation of the *Geschichte des Ursprungs der Deutschen* of Sartonius, 1830; *Heimathliches Urkundenbuch*, 1842; *Hamburgs Buchdruckerhäuser*, 1846; *Chroniken der Stadt Hamburg in niederdeutscher Sprache*, 1859-61; *Quellen zur Geschichte des Bräutheims u. der Stadt Bremen*, 1841, editions of the *Meinung* of Moreburg, Adam of Bremen, Helmold, and Arnold of Lübeck in the *Monumenta* of Pertz, and an edition of Th. Mann's *Fall Zulempen*, 1858.

LAPWING, Anglo-Saxon *Hleapwince* (= "one who turns about in rising or flight," see Skene's *Etymol. Dictionary*, p. 321); a bird, the *Tringa vulcanus* of Linnaeus and the *Actitis vulgaris* or *F. cristatus* of modern ornithologists.

In the temperate parts of the Old World this species is perhaps the most abundant of the Plovers, *Charadriidae*, breeding in greater or fewer numbers in almost every suitable place from Ireland to Japan,—the majority migrating towards winter to southern countries, as the Punjab, Egypt, and Barbary,—though in the British Islands some are always found at that season, chiefly about estuaries. As a straggler it has occurred within the Arctic

Circle (as on the Varanger Fjord in Norway), as well as in Iceland and even Greenland; while it not unfrequently appears in Madeira and the Azores. Conspicuous as the strongly contrasted colours of its plumage and its very peculiar flight make it, one may well wonder at its success in maintaining its ground when so many of its allies have been almost exterminated, for the Lapwing is the object perhaps of greater persecution than any other European bird that is not a plunderer. Its eggs—the well known "Plovers' Eggs" of commerce—are taken by the thousand or ten thousand; and, worse than this, the bird, wary and wild at other times of the year, in the breeding-season becomes easily approachable, and is (or used to be) shot down in enormous numbers to be sold in the markets for "Golden Plover." Its growing scarcity as a species was consequently in Great Britain very perceptible until an Act of Parliament (35 & 36 Vict. cap. 78) frightened people into letting it alone, and its numbers have since then as perceptibly increased, to the manifest advantage of many classes of the community—those who would eat its eggs, those who would eat its flesh (at this right time of year), as well as the agriculturists whose lands it frequented, for it is admitted on all hands that no bird is more completely the farmer's friend. What seems to be the secret of the Lapwing holding its position in spite of slaughter and rapine is the adaptability of its nature to various kinds of localities. It will find sustenance for itself and its progeny equally on the dreest soils as on the fattest pastures; upland and fen, arable and moorland, are alike to it, provided only the ground be open enough. The wailing cry and the frantic gestures of the cock bird in the breeding-season will tell any passer-by that a nest or brood is near; but, unless he knows how to look for it, nothing save mere chance will enable him to find it. Yet by practice those who are acquainted with the bird's habits will accurately mark the spot whence the hen silently rises from her treasure, and, disregarding the behaviour of the cock, which is intended to delude the intruder, will walk straight to one nest after another as though they knew beforehand the exact position of each. The nest is a slight hollow in the ground, wonderfully inconspicuous even when deepened, as is usually the case, by incubation, and the black-spotted olive

¹ There is a prevalent belief that many of the eggs sold as "Plovers'" are those of Rooks, but no notion can be more absurd, since the appearance of the two is wholly unlike. Those of the Redstart, of the Golden Plover (to a small extent), and enormous numbers of those of the Black-headed Gull, and in certain places of some of the Terns, are, however, undoubtedly sold as Lapwings', having a certain similarity of shell to the latter, and a difference of flavour only to be detected by a pale palate. It is estimated that 500,000 Lapwings' eggs are yearly sent to England from the one province of Friesland in Holland (see *Ornith. Centralblatt*, 1877, p. 168).

² This measure was really insufficient to afford it, or any other bird, proper protection, but the British public seldom read Acts of Parliament critically, and, hearing that one had been passed for the Preservation of Wild Birds, in which the Lapwing was specially named, most persons desisted from persecuting this species, not in the least knowing that the utmost penalty they could meet by killing it in the close-season would be but branding.

³ This sounds like pretence, with some variety of intonation. Hence the names *Pewit*, *Pease-weed*, and *Tench*, commonly applied in some parts of Britain to this bird,—though the first is that by which one of the smaller Gulls, *Larus ridibundus* (see GULL, vol. xi. p. 274), is known in the dialects it frequents. In Sweden *Vipa*, in Germany *Kiebitz*, in Holland *Kiebitz*, and in France *Dickwit*, are names of the Lapwing, given to it from its usual cry. Other English names are Green Plover and Hoppole—the latter from its long homilic crest and pied plumage. The Lapwing's conspicuous crest seems to have been the cause of a common blunder among our writers of the Middle Ages, who translated the Latin word *Upupa*, properly *HOODER* (*g. u.*), by *Lapwing*, as being the crested bird with which they were best acquainted. In like manner other writers of the same or an earlier period latinized Lapwing by *Egrettilis* (plum), and rendered that again into English as Egrets—the tuft of feathers misleading them also. The word *Vulcanus* is from *vulcanus*, the fen used for winnowing corn, and refers to the snail-like bending of the bird's wings.

⁴ Osdon in 1481 has "lapwryches" (*Reynard the Fox*, esp. 27).

eggs (four in number) are almost invisible to the careless or untrained eye unless it should happen to glance directly upon them. The young when first hatched are clothed with mottled down so as closely to resemble a stone and to be overlooked as they squat motionless on the approach of danger. At a distance the plumage of the adult appears to be white and black in about equal proportions, the latter predominating above, but on closer examination nearly all the seeming black is found to be a bottle-green gleaming with purple and copper, and the tail-coverts, both above and below, are seen to be of a bright bay colour that is seldom visible in flight. The nest consists of six or eight narrow and elongated feathers, turned slightly upwards at the end, and is usually carried in a horizontal position, extending in the cock beyond the middle of the back, but it is capable of being erected so as to become nearly vertical. Frequenting (as has been said) parts of the open country so very divergent in character, and as remarkable for the peculiarity of its flight as for that of its cry, the Lapping is far more often observed in nearly all parts of the British Islands than any other of the group, *Limicola*, to which it belongs. The peculiarity of its flight seems due to the wide and rounded wings it possesses, the steady and ordinarily somewhat slow flapping of which impels the body at each stroke with a manifest though easy jerk. Yet on occasion, as when performing its migrations, or even its almost daily transits from one feeding-ground to another, and still more when being pursued by a Falcon, the speed with which it moves through the air is very considerable; and the passage of a flock of Lapwings, twinkling aloft or in the distance, as the dark and light surfaces of the plumage are alternately presented, is always an agreeable spectacle to those who love a landscape enlivened by its wild creatures. On the ground this bird runs nimbly, and is nearly always engaged in searching for its food, which is wholly animal.

Allied to the Lapping are several forms that have been placed by ornithologists in the genera *Hoplopterus*, *Chettusia*, *Lobivanellus*, *Sarcophorus*, and so forth, but the respective degrees of affinity they bear to one another is not rightly understood, and space would prohibit any attempt at here expressing it. In some of them the hind toe, which has already ceased to have any function in the Lapping, is wholly wanting. In others the wings are armed with a tubercle or even a sharp spur on the carpus. Few have any occipital crest, but several have the face ornamented by the outgrowth of a fleshy lobe or lobes. With the exception of North America, they are found in most parts of the world, but perhaps the greater number in Africa. Europe has three species—*Hoplopterus spinosus*, the Spur-winged Plover, and *Chettusia gregaria* and *C. leucura*, but the first and last are only stragglers from Africa and Asia.

(A. N.)

LÁR, a city of Persia, capital of Láristán, in 27° 30' N. lat., 53° 58' E. long., 174 miles from Shiráz, and 127 from the coast at Mogu Bay. Láristán stands at the foot of a mountain range in an extensive plain covered with palm trees. The crest of a hill immediately behind the town is crowned by the ruins of a castle formerly deemed impregnable. Láristán was once a flourishing place, but a large portion is now in ruins, and the population is reduced to about 13,000. There are still some good buildings, of which the most prominent is the bazaar, said to be the finest in Persia, and resembling that of Shiráz, but considerably larger. The governor's residence stands in the centre of the town, and is surrounded by strong walls flanked with towers. There is also an outer moat filled by a canal of recent structure, which also serves to supply the numerous cisterns when the rain water fails. Láristán is noted for its manufacture of muskets and cloth.

LARCENY. See THEFT

LARCH (from the German *Leiche*, Latin, *larva*), a name applied to a small group of coniferous trees, of which the common larch of Europe is taken as the type. The members of the genus *Larix* are distinguished from the firs, with which they were formerly placed, by their deciduous leaves, scattered singly, as in *Abies*, on the young shoots of the season, but on all older branchlets growing in whorl-like tufts, each surrounding the extremity of a rudimentary or abortive branch, from cedars (*Cedrus*) they differ, not only in the deciduous leaves, but in the cones, the scales of which are thinner towards the apex, and are persistent, remaining attached long after the seeds are discharged. The trees of the genus are closely allied in botanic features, as well as in general appearance, so that it is sometimes difficult to assign to them determinate specific characters, and the limit between species and variety is not always very accurately defined. Nearly all are natives of Europe, or the northern plains and mountain ranges of Asia and North America, though one occurs only on the Himalaya, a somewhat aberrant form, usually placed in a separate sub-genus, is peculiar to north China and Japan.

The common larch (*L. europaea*) is, when grown in perfection, a stately tree with tall erect trunk, gradually tapering from root to summit, and horizontal branches

Branchlet of Larch (*Larix europaea*)

springing at irregular intervals from the stem, and in old trees often becoming more or less drooping, but rising again towards the extremities; the branchlets or side shoots, very slender and pendulous, are pretty thickly studded with the whorls of narrow linear leaves, of a peculiar bright light green when they first appear in the spring, but becoming of a deeper hue when mature. The yellow stamen-bearing flowers are in sessile, nearly spherical catkins, the fertile ones vary in colour, from red or purple to greenish-white, in different varieties; the erect cones, which remain long on the branches, are above an inch in length and oblong-ovate in shape, with reddish-brown scales somewhat wared on the edges, the lower bracts usually rather longer than the scales. The tree flowers in April or May, and the winged seeds are shed the following autumn. When standing in an open space, uncrowded by neighbouring trees,

the larch grows of a nearly conical shape, with the lower branches almost reaching the ground, while those above gradually diminish in length towards the top of the trunk, presenting a very symmetrical form; but in dense woods the lower parts become bare of foliage, as with the firs under similar circumstances. When springing up among rocks or on ledges, the stem sometimes becomes much curved, and, with its spreading boughs and pendent branchlets, often forms a striking and picturesque object in the alpine passes and steep ravines in which the tree delights to grow. In the prevalent European varieties the bark is reddish-grey, and rather rough and scarred in old trees, which are often much lichen-covered. The trunk attains a height of from 80 to 140 feet, with a diameter of from 3 to 5 feet near the ground, but in close woods is comparatively slender in proportion to its altitude. The larch abounds on the Alps of Switzerland, on which it flourishes at an elevation of 5000 feet, and also on those of Tyrol and Savoy, on the Carpathians, and in most of the hill regions of central Europe, it is likewise found on parts of the Apennine chain, but is not indigenous to the Pyrenees, and in the wild state is unknown in the Spanish peninsula. It forms extensive woods in Russia, but does not extend its range to the Scandinavian countries, where its absence is somewhat remarkable, as the tree grows freely in Norway and Sweden where planted, and even multiplies itself by self-sown seed, according to Schubeler, in the neighbourhood of Trondhjem. In the north-eastern parts of Russia, in the country towards the Petchora river, and on the Ural, a peculiar variety prevails, regarded by some as a distinct species (*L. sibirica*); this form is abundant nearly throughout Siberia, extending to the Pacific coast of Kamchatka and the hills of Dahuria. The Siberian larch has smooth grey bark and smaller cones, approaching in shape somewhat to those of the American hackmatack; it seems even harder than the Alpine tree, growing up to latitude 68°, but, as the inclement climate of the polar shores is neared, dwindling down to the form of a dwarf and even trailing bush, on the Altai, however, Pallas states that it flourishes only at medium elevations.

The larch, from its lofty straight trunk and the high quality of its wood, must be regarded as one of the most important of coniferous trees, its growth is extremely rapid, the stem attaining a large size in from sixty to eighty years, while the tree yields good useful timber at forty or fifty, it forms firm heartwood at an early age, and the sapwood is less perishable than that of the fir, rendering it more valuable in the young state.

The wood of large trees is close and compact in texture, in the best varieties of a deep reddish colour varying to brownish-yellow, but apt to be lighter in tint, and less hard in grain, when grown in rich soils or in low sheltered situations. It is remarkably tough, resisting a rough strain better than any of the fir or pine woods in common use, though not as elastic as some; properly seasoned it is as little liable to shrink as to split; the boughs being small compared to the trunk, the timber is more free from large knots, and the small knots remain firm and undecayed. The only drawback to these good qualities is a certain inability to warp and bend, unless very carefully seasoned, for this purpose it is recommended to be left floating in water for a year after felling, and then allowed some months to dry slowly and completely before sawing up the logs; barking the trunk in winter while the tree is standing, and leaving it in that state till the next year, has been often advised with the larch as with other timber, but the practical inconveniences of the plan have prevented its adoption on any large scale. When well prepared for use, larch is one of the most durable of coniferous woods. Its strength and toughness render it valuable for naval purposes, to which it is largely applied, its freedom from any tendency to split adapts it for clinker-built boats, for the construction of which a high authority, Matthew, pronounced it the best of all woods. It is much employed for house building in all countries where it grows in abundance, most of the picturesque log-houses in Vend and the adjacent outcrops are built of squared larch trunks, and derive their fine brown tint from the hardened rind that slowly exudes from the wood after long exposure to the summer sun; the

wooden shingles, that in Switzerland supply the place of tiles, are also frequently of larch. In Germany it is much used by the cooper as well as the carpenter, durable staves for casks being made of this valuable wood, while the foam of the trunk admirably adapts it for all purposes for which long straight timber is needed. It is one of the most durable of woods in wet ground or under water, and answers well for fence-posts and river piles, many of the foundations of old Venetian vessels upon larch, the lasting qualities of which were well known and appreciated, not only in medieval times, but in the far-off days of Vitruvius and Pliny. The harder and darker varieties are valuable to the cabinetmaker in the construction of cheap solid furniture, being fine in grain and taking polish better than many more costly woods. A peculiarity of larch wood is the difficulty with which it is ignited, although so resinous, a quality that gives it still higher value to the builder; for, though not quite so incombustible as the Romans deemed it, large pieces do not as easily take fire as the ordinary kinds of deal timber; mud, coated with a thin layer of plaster, beams and pillars of larch might probably be found to justify Cæsar's epithet "*ignis impenetrabile lignum*"; even the small branches are not easily kept alight, and a larch fire in the open needs considerable care. Yet the forests of larch in Siberia often suffer from conflagration. When these fires occur while the trees are full of sap, a curious phenomenon is witnessed: the bark of the half-burnt stems; when dried of a pale drab colour, like some of the coarser kinds of gun-grain, and is soluble in water, the solution resembling gun-water, in place of which it is sometimes used, considerable quantities are collected and sold as "Orenburg gum"; in Siberia and Russia it is occasionally employed as a semi-medicinal food, being stewed in an oil-water. For burning in close stoves and furnaces, larch makes tolerably good fuel, its value being estimated by Hartig as only one-fifth less than that of beech, the charcoal is compact, and is in demand for iron-smelting and other metallurgical uses in some parts of Europe.

In the trunk of the larch, especially when growing in climates where the sun is powerful in summer, a first clear turpentine exudes in great abundance, on the declivities of the Alps of Savoy and the south of Switzerland, it is collected by the peasants for sale, though not in such quantity as formerly, when, being taken to Venice for shipment, it was known in commerce as "*Venise turpentine*". Old trees are selected, from the bark of which it is observed to exude in the early summer; holes are bored in the trunk, somewhat inclined upward towards the centre of the stem, in which, between the layers of wood, the turpentine is said to collect in small lacunæ, wooden gutters placed in these holes convey the viscous fluid into little wooden pails hung on the end of each gutter; the collection flows slowly all through the summer months, the little tubs are emptied and replaced as they fill, a tree in the proper condition yields from 6 to 8 lb a year, and will continue to give an annual supply for thirty or forty years, being, however, reckoned quite useless for timber by objection to this exhausting process. In Tyrol, whence a supply is also obtained, a single hole is made near the root of the tree in the spring; this is stopped with a plug, and the turpentine is removed by a scoop in the autumn, but each tree yields only from a few ounces to 3 lb by this process. Real larch turpentine is a thick tenacious fluid, of a deep yellow colour, and nearly transparent, it does not harden by time, it contains 15 per cent. of the essential oil of turpentine, also resin, succinic, pine, and styracic acids, and a bitter extractive matter. According to Pereira, much sold under the name of Venetian turpentine is a mixture of common resin and oil of turpentine, and probably little of the real article now reaches England. On the French Alps a sweet excretion is found on the stem of the young larches in June and July, resembling manna in taste and laxative properties, and known as *Manna de Briançon* or *Manna Brigantina*; it occurs in small whitish irregular granular masses, which are removed in the morning before they are too much dried by the sun, this manna seems to differ little in kind from that of the sap of the tree, which also contains *mannite*, its osmotic powers are weaker than those of the manna of the manna ash (*Ostrya*), but it is employed in France for the same purposes. The bark of the larch is largely used in some countries for tanning; it is taken from the trunk only, being stripped from the trees when felled, its value is about equal to that of bark bark; but, according to the experience of British tanners, it is scarcely half as strong as that of the oak. The soft inner bark is occasionally used in the wilds of Siberia as a ferment, by hunters and others, being boiled and mixed with yeast, and buried in the snow for a short time, when it is employed as a substitute for other leaven, and in making the sour liquor called "*quass*". In Germany a fungus (*Holoporus larchæ*) grows on the roots and stems of decaying larches, which was formerly in esteem in England as a drastic purgative, but has given place to safer drugs, though it is still occasionally used by the Continental pharmacist. The young shoots of the larch are sometimes given in Switzerland as fodder to cattle.

The larch, though mentioned by Parkinson in 1620 as "nursed up" by a few "lovers of variety" as a rare exotic.

does not seem to have been much grown in England till early in the last century. In Scotland the date of its introduction is a disputed point, but it seems to have been planted at Dunkeld by the duke of Athole in 1727, and about thirteen or fourteen years later considerable plantations were made at that place, the commencement of one of the largest planting experiments on record, it is estimated that 14 million larches were planted on the Athole estates between that date and 1826. The cultivation of the tree rapidly spread, and the larch has long become a conspicuous feature of the scenery in many parts of Scotland. It grows as rapidly and attains as large a size in British habitats suited to it as in its home on the Alps, and often produces equally good timber, but has sometimes been planted under circumstances little adapted to its successful growth. The larch of Europe is essentially a mountain tree, and requires, not only free air above, but a certain moderate amount of moisture in the soil beneath, with, at the same time, perfect drainage, to bring the timber to perfection,—conditions often occurring on the mountain slope and rocky glen that form its natural habitats, but not always so readily provided in artificial culture. Complete freedom from stagnant water in the ground, and abundant room for the spread of its branches to light and air, are the most necessary requirements for the successful growth of larch,—the contrary conditions being the most frequent causes of failure in the cultivation of this valuable tree. Where these important needs are complied with, it will flourish in a great variety of soils, stiff clays, wet or mossy peat, and moist alluvium being the chief exceptions, in its native localities it seems partial to the debris of primitive and metamorphic rocks, but is occasionally found growing luxuriantly on calcareous subsoils; in Switzerland it attains the largest size, and forms the best timber, on the northern declivities of the mountains; but in Scotland a southern aspect appears most favourable. The best variety for culture in Britain is that with red female flowers; the light-flowered kinds are said to produce inferior wood, and the Siberian larch does not grow in Scotland nearly as fast as the Alpine tree. The larch is raised from seed in immense numbers in British nurseries, that obtained from Germany is preferred, being more perfectly ripened than the cones of home growth usually are. The seeds are sown in April, on rich ground, which should not be too highly manured, the young larches are planted out when two years old, or sometimes transferred to a nursery bed to attain a larger size; but, like all conifers, they succeed best when planted young; on the mountains, the seedlings are usually put into a mere slit made in the ground by a spade with a triangular blade, the place being first cleared of any heath, broken, or tall herbage that might smother the young tree; the plants should be from 3 to 4 feet apart, or even more, according to the growth intended before thinning, which should be commenced as soon as the boughs begin to overspread much; little or no pruning is needed beyond the careful removal of dead branches. The larch is said not to succeed on arable land, especially where corn has been grown, but recent experience does not seem to support this prejudice, that against the previous occupation of the ground by Scotch fir or Norway spruce is probably better founded, and, where timber is the object, it should not be planted with other conifers. On the Grampians and neighbouring hills the larch will flourish at a greater elevation than the pine, and will grow up to an altitude of 1700 or even 1800 feet; but it attains its full size on lower slopes. In very dry and bleak localities, the Scotch fir will probably be more successful up to 900 feet above the sea, the limit of the luxuriant growth of that hardy conifer in Britain; and in moist valleys or on imperfectly drained acclivities Norway

spruce is more suitable. The growth of the larch while young is exceedingly rapid, in the south of England it will often attain a height of 25 feet in the first ten years, while in favourable localities it will grow upwards of 80 feet in half a century or less, one at Dunkeld felled sixty years after planting was 110 feet high, but usually the tree does not increase so rapidly after the first thirty or forty years. Larches now exist in Scotland that rival in size the most gigantic specimens standing in their native woods, a tree at Dalwick, Peeblesshire (said to have been planted in 1725), is 5 feet in diameter, one at Glenarbuch, near the Clyde, is above 140 feet high, with a circumference of 13 feet. The annual increase in girth is often considerable even in large trees, the fine larch near the abbey of Dunkeld figured by Strutt in his *Sylvia Britannica* increased $2\frac{1}{2}$ feet between 1796 and 1825, its measurement at the latter date being 13 feet, with a height of 97½ feet.

In the south of England, the larch is much planted for the supply of hop-poles, and is considered one of the best woods for that purpose, the stems being straight and easily trimmed into poles, while they are extremely durable, though in parts of Kent and Sussex those formed of Spanish chestnut are regarded as still more lasting. In plantations made with this object, the seedlings are placed very close (from $1\frac{1}{2}$ to 2 feet apart), and either cut down all at once, when the required height is attained, or thinned out, leaving the remainder to gain a greater length; the land is always well trenched before planting. The best season for larch planting, whether for poles or timber, is the month of November, the operation is sometimes performed in the spring, but the practice cannot be commended, as the sap flows early, and, if a dry period follows, the growth is sure to be checked. The thinning of the larch woods in the Highlands are in demand for railway sleepers, scaffold poles, and mining timber, and are applied to a variety of agricultural purposes. The tree generally succeeds on the Welsh hills, and might with advantage be planted on many of the drier mountains of Ireland, now more barren moorland or poor unremunerative pasture.

The European larch has long been introduced into the United States, where, in suitable localities, it flourishes as luxuriantly as in Britain. Of late years some small plantations have been made in America with an economic view, the tree growing much faster, and producing good timber at an earlier age, than the native hackmatack, while the wood is less ponderous, and therefore more generally applicable.

The larch in Britain is occasionally subject to destructive casualties. The young seedlings are sometimes nibbled by the hare and rabbit, and on parts of the Highland hills both bark and shoots are eaten in the winter by the roe-deer, which is a great enemy to young plantations, larch woods should always be fenced in to keep out the hill-cattle, which will browse upon the shoots in spring. The "woolly apha," "American blight," or "larch blight" (*Eriosema larycia*) often attacks the trees in close valleys, but rarely spreads much unless other unhealthy conditions are present. A far more formidable enemy is the disease known as the "heart-rot"; it occurs in all the more advanced stages of growth, occasionally attacking young larches only ten years old or less, but is more common at a later period, when the trees have acquired a considerable size, sometimes spreading in a short time through a whole plantation. The trees for a considerable period show little sign of unhealthiness, but eventually the lower part of the stem near the root begins to swell somewhat, and the whole tree gradually goes off as the disease advances, when cut down, the trunk is found to be decayed at the centre, the "rot" usually commencing near the ground and gradually extending upwards. Trees of good size are thus rendered nearly worthless, often showing little sign of unhealthiness till felled. Great difference of opinion exists among foresters as to the cause of this destructive malady; the manner in which it spreads would seem to indicate a fungoid origin, and the previous growth of pine on the ground is one of the most usual explanations offered. That some fungoid mycelium may be the remote cause of the disease seems not improbable; but there is little doubt that any circumstance that tends to weaken the tree acts as

a predisposing cause of the attack, and the best safeguards are probably perfect drainage, and early and sufficient thinning. On exposed hill-sides, and other well-drained breezy localities, the larch is little liable to failure from "rot" or any other cause. On arid soils, however, the tree will sometimes be injured in very dry seasons, and such situations, though suitable for Scotch fir, are therefore badly adapted for larch.

Considerable quantities of larch timber are imported into Britain for use in the dockyards, in addition to the large home supply. The quality varies much, as well as the colour and density, an Italian sample in the museum at Kew (of a very dark red tint) weighs about 24½ lb to the cubic foot, while a Polish specimen, of equally good larch, is 44 lb to the same measurement.

For the purposes of the landscape gardener, whose chief aim is the picturesque, the larch is a valuable aid in the formation of park and pleasure ground. On steep hill-sides, the lofty asping stem and drooping branchlets add a pleasing feature to the prospect; the light airy aspect of the tree adapts it as a contrast to the heavier masses of the pines and firs, the bright light-green foliage in the spring affords an agreeable variety, and nature presents few more refreshing objects to the sight than a larch plantation bursting into young leaf, in the late autumn, the pale yellow of the changing foliage stands out in strong relief to the sombre tones of the ever-green conifers, or the deep red-brown of the beech, but in park or plantation the larch is never seen to such advantage as when hanging over some tumbling brook or rocky pass among the mountains. A variety with very pendulous boughs, known as the "drooping" larch, is occasionally met with in gardens.

The bark of the larch has lately been introduced into pharmacy, being green, generally in the form of an alcoholic tincture, in chronic bronchitic affections and internal hemorrhages. It contains, in addition to tannin, a peculiar principle called *larixin*, which may be obtained in a pure state by distillation from a concentrated infusion of the bark; it is a colourless substance in long crystals, with a bitter and astringent taste, and a faint reaction, hence some term it *lari icinic acid*.

The genus is represented in the eastern parts of North America by the hackmatacks (*L. laricina*), of which there are several varieties, two so well-marked that they are by some botanists considered specifically distinct. In one (*L. microcarpa*) the cones are very small, rarely exceeding ½ inch in length, of a rounded-oblong shape; the scales are very few in number, often in the young state, reddish-brown when ripe, the tree itself resembles the European larch in general appearance, but is of more slender growth; its trunk is seldom more than 2 feet in diameter, and rarely above 40 feet high; this form is the red larch, the *épinette rouge* of the French Canadians. The black larch (*L. pendula*) has rather larger cones, of an oblong shape, about ½ inch long, purplish or green in the immature state, and dark brown when ripe, the scales somewhat more numerous, the bracts all shorter than the scales. The bark is dark bluish-grey, smoother than in the red larch, on the trunk and lower boughs often glossy, the branches are more or less pendulous and very slender. The red larch grows usually on higher and drier ground, ranging from the Virginia mountains to the shores of Hudson's Bay; the black larch is found often on moist land, and even in swamps. The hackmatack is one of the most valuable timber trees of America; it is in great demand in the ports of the St. Lawrence for shipbuilding, the best vessels built in British America having their frames wholly or partially constructed of this fine wood. It is far more durable than any of the oaks of that region, is heavy and close-grained, and much stronger, as well as more lasting, than that of the pines and firs of Canada. In many parts all the finer trees have been cut down, but large woods of it still exist in the St. Lawrence district, especially near Lake St. John, and in Newfoundland is the prevalent tree in some of the forest tracts, it is likewise common in Maine and Vermont. In the timber and building yards the "red" hackmatack is the kind preferred, the produce, probably, of *L. microcarpa*; the "grey" is less esteemed, but the varieties from which these woods are obtained cannot always be traced with certainty. Several of the specimens of the red larch exist in English parks, but its growth is much slower than that of *L. europæa*, and it has never been planted on a large scale; the more pendulous forms of *L. pendula* are elegant trees for the garden. The hackmatacks might perhaps be grown with advantage in places too wet for the common larch.

In western America a larch occurs more nearly resembling *L. europæa*, the western larch (*L. occidentalis*) of Nuttall, who speaks of it as found by him in "the coves of the Rocky Mountains on the western slope of Oregon." The leaves are short, thicker and more rigid than in any of the other larches, the cones are much larger than those of the hackmatacks, egg-shaped or oval in outline; the scales are of a fine red in the immature state, the bracts green and extending far beyond the scales in a rigid leaf-like point. The bark is much like the same reddish tint as that of the common larch of Europe. This is probably the tree described by Fremont as the European larch, and found by him in great abund-

ance on the Blue Mountains, near the valley called the Grand Rond. He alludes to the large size of the trunk, some of the trees being 200 feet high and one 10 feet in circumference, the stems were often clear of branches for 100 feet from the ground. Little is known of the quality of the timber, but specimens of the wood seem to be firm and close in grain, the colour is a pale reddish tint throughout. From its great size the tree would appear worthy of the attention of American planters.

The other species of the genus *Larix* present few features of interest except to the botanist.

(C. P. J.)

LARD is the melted and strained fat of the common hog. The bulk of the lard of commerce is obtained from the abdominal fat of the animal, but in the preparation of inferior qualities fatty scraps of all kinds which result from the preparation of pork are melted up, and occasionally entire flanks of pigs are treated for the fat they yield. Ordinary lard is a pure white fat of the consistency of butter, having a faint characteristic taste, and scarcely any odour. It melts at between 78° to 83° Fahr., has a specific gravity of 0.915, and consists of 62 per cent of fluid fat (olein or lard oil), and 38 per cent of the hard fats palmitin and stearin. If perfectly pure, it has no tendency to become rancid, but there is generally sufficient impurity present to develop a change in the olein, which gradually exhibits itself by a yellow colour and a rancid odour and taste.

Lard is an article of considerable importance in commerce; it is calculated that the annual produce of the substance in the United States of America alone is not less than 5,000,000 cwt. Its preparation is conducted in connexion with the great pork-curing and packing establishments, mostly centred in Chicago, Cincinnati, St. Louis, Milwaukee, Louisville, and Indianapolis.—Chicago alone now monopolizing about one-half of the American trade. In these establishments the fat is "rendered" in large vats heated by coils or worms of steam pipes, each charge being completely melted in from ten to twelve hours. The graves or cracklings which remain are used for making "dog biscuits," &c. The finest lard is prepared from the "leaf" fat of the abdominal cavity, and passes into commerce as "prime steam lard." The intestinal fat, trimmings, and refuse yield No. 2 lard, which is mostly sent to the European market. The summer-killed pigs yield on an average 34 lb of lard, while the winter-killed animals produce about 37 lb, but in the case of selected animals these figures may rise to 45 lb and 54 lb respectively. The uses of lard are numerous; it is largely employed by biscuit and pastry bakers and in domestic cookery; it is used in the dressing and currying of leather, it is an important article in pharmacy for ointments, plasters, and suppositories; it forms a principal ingredient in many pomades and preparations for the toilet; and it is the source of the important lard oil and "solar stearin" noted below. Lard is occasionally adulterated with water up to 20 per cent, with starch, chalk, plaster of Paris, baryta, &c. Such falsifications, owing to the nature of the substance, are easily detected—the water by bringing the substance gently to the melting point when it separates; starch by the characteristic reaction with iodine; and mineral substance by the ash remaining after the burning of the fat. The imports into the United Kingdom in 1880 amounted to 927,512 cwt., value £1,852,160,—the very large proportion of 873,100 cwt. coming from the United States, and 46,618 from British North America. A large amount of native lard is also consumed in the United Kingdom, this being usually put up in bladders for sale. That prepared in Wiltshire is the most highly prized, and is the quality generally used in domestic cookery.

Lard oil is the limpid, clear, colourless oil expressed by pressure and gentle heat from lard, leaving a solid, glistening, and crystalline residue, known in commerce as "solar stearin," which is useful in candle making, but is also used to adulterate spermaceti. Lard oil has now

an important function in industry, being principally employed for the oiling of wool and in lubrication. It is also a good deal consumed in the falsification of more valuable oils, for which its neutral properties well adapt it, and it is turn is adulterated with cotton seed oil, &c.

LARDNER, DIONYSIUS (1793-1859), a prolific scientific writer, was born at Dublin, April 3, 1793. His father was a solicitor, and intended his son to follow the same calling. After some years of uncongenial desk work, Lardner, determining on a university career, entered Trinity College, Dublin, and graduated B.A. in 1817. In 1823 he became professor of natural philosophy and astronomy at University College, London, a position which he held till 1840, when he eloped with a married lady, and had to leave the country. After a most successful lecturing tour through the principal cities of the United States, which realized 200,000 dollars, he returned to Europe in 1845. He settled at Paris, and continued to reside there till within a few months of his death, which took place at Naples, April 29, 1859.

Though lacking in real originality or brilliancy, Lardner showed himself to be a successful popularizer of science. He was the author of numerous mathematical and physical treatises on such subjects as algebraic geometry (1823), the differential and integral calculus (1825), the steam engine (1828), besides hand-books on various departments of natural philosophy (1864-68), but it is as the editor of *Lardner's Cyclopedia* (1830-44) that he will be best remembered. To this scientific library of 124 volumes many of the ablest savants of the day contributed, Lardner himself being the author of the treatises on arithmetic, geometry, heat, hydrostatics and pneumatics, mechanics (in conjunction with Kater), and electricity (in conjunction with Walker). *The Cabinet Library* (12 vols., 1830-32) and the *Museum of Science and Art* (12 vols., 1854-56) are his other chief undertakings. A few original papers appear in the Royal Irish Academy's *Transactions* (1824), in the Royal Society's *Proceedings* (1831-36), and in the Astronomical Society's *Monthly Notices* (1852-53); and two letters to the British Association on railway constants (1856, 1857) are from his pen.

LARDNER, NATHANIEL (1684-1768), author of *The Credibility of the Gospel History*, was born at Hawkhurst, Kent, in 1684. After having studied for the Presbyterian ministry in London, and also at Utrecht and Leyden, he in 1709 took licence as a preacher, but, failing to gain acceptance in the pulpit, he in 1713 entered the family of a lady of rank as tutor and domestic chaplain, and in this position he remained until 1721. In 1724 he was appointed to deliver the Tuesday evening lecture in the Presbyterian chapel, Old Jewry, London, and in 1729 he became assistant minister to the Presbyterian congregation in Orchard Friars. He died at Hawkhurst on July 24, 1768.

An anonymous volume of *Memoirs* appeared in 1786; and a life by Kippax is prefixed to the edition of the *Works* of Lardner, published in 11 vols. 8vo in 1788, in 4 vols. 4to in 1817, and 10 vols. 8vo in 1827. The full title of his principal work—a work which, though now quite out of date, gives its author a permanent place of some respectability in the history of Christian apologetics—is *The Credibility of the Gospel History, or the Principal Facts of the New Testament confirmed by Passages of Ancient Authors, who were contemporary with our Saviour or his Apostles or lived near their time*. Part I., in 2 vols. 8vo, appeared in 1767, the publication of part II., in 12 vols. 8vo, began in 1788 and ended in 1765. In 1780 there was a second edition of part I., and the *Additions and Alterations* were also published separately. A Supplement, otherwise entitled *A History of the Apostles and Evangelists, Writers of the New Testament*, was added in 3 vols. (1758-57), and reprinted in 1780. Other works by Lardner are *A large Collection of Ancient Jewish and Hebraic Testimonies to the Truth of the Christian Revelation, with Notes and Observations*, 4 vols. 4to, 1764-67; *The History of the Heresies of the two first centuries after Christ*, published posthumously in 1780; a considerable number of occasional sermons; and *A Letter concerning the question whether the Logos supplied the place of the Human Soul in the Person of Jesus Christ*. In this tract, written in 1780 and published in 1769, Lardner indicated his preference for the Unitarian view.

LARES were Roman deities, whose character and worship share in the obscurity that envelops all antique

Roman religion. They belonged to the cultus of the dead, from which so much of Roman and Greek religion was derived, they were the deified ancestors still living in their graves in the house, and worshipped by the family as their guardians and protectors. But the dead were powerful also to do harm, unless they were duly propitiated with all the proper rites, they were spirits of terror as well as of good, in this fearful sense the names *Lemures* and still more *Laræ* were appropriated to them. The name *Lar* has been thought to be an Etruscan word, meaning "lord"; it is a common personal name or title in Etruria. We find certainly, from a very early time, a distinction between *Lares privati* and *Lares publici*. The former were worshipped in the house by the family alone, and the *Lar familiares* was conceived as the head of the family and of the family cultus. The *Lares publici* belonged to the state religion; and their worship, after having fallen into neglect, was restored by Augustus and to some extent remodelled. It is therefore difficult to distinguish how far the known rites of the cultus are ancient, but it seems certain that the *genius* of Augustus, as refounder of the state, was added, and that the original *Lares praestites* were two in number. Schwegler and others have maintained that this pair are the twin brothers so frequent in early religions, the Romulus and Remus of the Roman foundation-legend; that the tale of the twins is in most of its elements derived from the religion of the two *Laræ*; that Acca Larentia, the foster-mother of the twins, is the same as *Lara*, *Larunda*, *Mania*, or *Muta*, the mother of the *Laræ*, and that the Larentalia, celebrated on December 23, was a feast of the *Laræ*. But the two sets of legends must be strictly distinguished, the difference in the quantity of the opening syllable shows that Larentia has no connexion with *Larunda* and the *Laræ*; the Larentalia was a festival of Jupiter and Acca Larentia, in which the *Laræ* had no place; and Mommsen argues that Remus was a late addition to the foundation legend, in which originally Romulus alone was known. As restored by Augustus, the *Lares praestites* were the guardians of the state and protectors of its unity; and, in lesser circles, every division of the city had likewise its *Lares compitales*, now three in number, who had their own *aedilia* at the cross roads and their special festival, *Compitalia*. The temple of the city *Lares* (*aeculum Larum*) was near the top of the Via Sacra.

The worship of the private *Laræ*, who had their home either on the hearth of the *atrium*, or in their own little shrines, *lararium*, persisted throughout the pagan period, but in later times changed its character to a great extent. The emperor Alexander Severus had images of Abraham, Christ, and Alexander the Great among his household *Laræ*. These domestic *Laræ* were worshipped daily, but with special rites on the kalends, nones, and ides of every month; they shared with the family in every festival; when the young bride entered the house for the first time she offered a sacrifice to them; when the boy assumed the *toga virilis* he dedicated his childish *bulle* to the *Lar familiares*. Marquardt maintains that there was only one *Lar* in each household, and that the two *Laræ compitales* were the guardians of the two roads that intersected at the *compita*. The *Lemures* are distinguished from the *Laræ* were propitiated at the festival of the *Lemuralia*, on the 8th, 11th, and 13th of May. In it the dead were propitiated, and the strange unexplained ceremony of throwing the *arææ* into the river was performed. A legend of the birth of the *Laræ* makes them children of the god Mercury and a female figure, *Larunda*, *Lara*, or *Lala*. The fact that the dog was sacred to them, and that a stone figure of a dog stood in the Saelianum *Larum*, deserves notice in illustration of this legend, for the dog is connected with the Greek god Hermes. Probably this may have arisen under Greek influence. Other classes of *Laræ* mentioned as early as the republican period are the *Laræ rurales*, *viales*, *permarina*. To the last-named *Laræ* dedicated a temple in commemoration of the naval victory over Antiochus, 190 B.C. The generally accepted view is that the *Laræ* are represented as young men, crowned with laurel, dressed in short high-girt tunics, holding horns and cups in their hands; but Marquardt, in accordance with his view that there was only one *Lar*, considers that these two figures are ponses, and on a coin of the gens *Oesia* the *Laræ* are represented as two young men with chlamys and

spare, seated, with a dog between them. Jordan remarks that in the conduct of the end of the toga was thrown over the head, whereas the Lares always wear only a tunic, and have never veiled heads. The *Comptatius* was, during the Republican time, a *foras conceptus*, set by the pastor at some time soon after the Saturnalia, December 17-19. Under the empire it was fixed for January 8-6.

LARGILLIÈRE, NICOLAS (1656-1746), perhaps the most distinguished portrait painter of the age of Louis XIV., was born at Paris, October 20, 1656. His father, who was a merchant, took him to Antwerp at the age of three, and when nine years old he accompanied a friend of the family to London, where he remained nearly two years. The attempt to turn his attention to business having failed, he entered, some time after his return to Antwerp, the studio of Goubeau, quitting this at the age of eighteen to seek his fortune in England, where he was befriended by Lely, who employed him for four years at Windsor. His skill attracted the notice of Charles II., who wished to retain him in his service, but the fury aroused against Catholics by the Rye House Plot alarmed Largillière for his own safety, and he left England for Paris, where he was well received by Le Brun and Van der Meulen. In spite of his Flemish training the reputation of Largillière, especially as a portrait painter, was soon established; his brilliant colour and lively touch attracted all the celebrities of the day,—actresses, public men, and popular preachers flocking to his studio. Huet, bishop of Avranches, Cardinal de Noailles, the Duclos, and President Lambert, with his beautiful wife and daughter, are amongst some of his most noted subjects. It is said that James II. recalled Largillière to England on his accession to the throne in 1685, that he declined to accept the office of keeper of the royal collections, but that, although he could not be induced to remain in London permanently, he made a short visit, during which he painted portraits of the king, the queen, and the prince of Wales. This last is impossible, as the birth of the prince did not take place till 1688, the three portraits, therefore, painted by Largillière of the Pretender in his youth must all have been executed in Paris, to which city he returned some time before March 1685, when he was received by the Academy as a member, and presented as his diploma picture the fine portrait of Le Brun, now in the Louvre. He was received as an historical painter; but, although he occasionally produced works of that class (*Oruifiction*, engraved by Roettiers), and also treated subjects of still life, it was in historical portraits that he excelled. Horace Walpole tells us that he left in London those of Pierre van der Meulen and of Sybrecht. His works are rare in the local museums, but several are at Versailles. The church of St. Étienne du Mont at Paris contains the finest example of Largillière's work when dealing with large groups of figures, it is an *ex voto* offered by the city to St. Genevieve, painted in 1694, and containing portraits of all the leading officers of the municipality. Largillière passed through every post of honour in the Academy, until in 1743 he was made chancellor. He died on the 20th March 1746. Oudry was the most distinguished of his pupils. Largillière's work found skilful interpreters in Van Schuppen, Edelink, Desplaces, Drevet, Pilon, and other engravers.

LARISSA (in Turkish *Pens Şehir*), the most important town of Thessaly, is situated in a rich agricultural district on the right bank of the Salambrina (Peneus), about 35 miles north-west of Volo. Up till 1881 it was the seat of a pasha in the vilayet of Janina, it now ranks

as the chief town of the new Greek province. Its long subjection to Turkey has left little trace of a nobler antiquity, and the most striking features in the general view are the mosques and the Mohammedan burying-grounds. It was the seat of a strong Turkish garrison, and the great mass of the people were of Turkish blood. In the outskirts is a village of Africans from the Sudan—a curious remnant of the forces collected by Ali Pasha. The manufactures include Turkish leather, cotton, silk, and tobacco, but the general state of trade and industry is far from being prosperous. Fevers and agues are rendered prevalent by the badness of the drainage and the overflowing of the river, and the death-rate is higher than the birth-rate. The population is estimated at 25,000 or 30,000.

Larissa, written Larisa on ancient coins and inscriptions, is near the site of the Homeric Argissa. It appears in early times as a powerful city under the rule of the Alcmæonæ, whose authority extended over the whole plain of the Pelagoponæ. The inhabitants sided with Athens during the Peloponnesian War, and during the Roman invasion their city was a point of considerable importance. In the 6th century it was made the seat of an archbishop, who has now fifteen suffragans. During the war of Greek independence Larissa was the headquarters of Ali Pasha. Notices of the few ancient inscriptions recently found at Larissa are given by Miller in *Mélanges philologiques*, Paris, 1880. The name Larissa is a common one, and the city has many particularly to be distinguished from Larissa Cremata on Mount Olympus.

LARISTÁN, a province of Persia, bounded by Farsistán on the W and N.W., by Kirmán on the E. and N.E., by the Persian Gulf on the S. It lies between 28° 30' and 28° 26' N. lat., 52° 30' and 55° 30' E. long., and has an extreme length and breadth of 210 and 120 miles respectively, with an area of 20,000 square miles. Laristán is one of the least productive provinces in Persia, consisting mainly of mountain ranges in the north and east, and of arid plains varied with rocky hills and salt or sandy valleys stretching thence to the coast. In the highlands there are some fertile upland tracts producing corn, dates, and other fruits; and there the climate is genial. But elsewhere it is extremely sultry, and on some low-lying coast lands subject to malaria. Good water is everywhere so scarce that but for the rain preserved in cisterns the country would be mostly uninhabitable. The coast is chiefly occupied by Arab tribes under their own chiefs, who are virtually independent, paying merely a nominal tribute to the shah's Government. They reside in small towns and mud forts scattered along the coast, and were till recently addicted to piracy. The people of the interior are mostly of the old Iranian stock, intermediate between the Tajiks and Kurds, and speaking an archaic form of Persian. Here the chief tribes are the Memajan, about 1600, with numerous flocks and herds; the Bekoi, 2500, and the Tahuni, 200. Laristán was subdued eight hundred years ago by a Turki khan, and remained an independent state till its last ruler was deposed and put to death by Shah 'Abbás the Great. Population about 90,000.

LARK, Anglo-Saxon *Læwerce*, German *Lerche*, Danish *Lærke*, Dutch *Leuwerik*, a bird's name (perhaps always, but now certainly) used in a rather general sense, the specific meaning being signified by a prefix, as Skylark, Titlark, Woodlark, and so forth. It seems to be nearly synonymous with the Latin *Aldaia* as used by older authors; and, though this was to some extent limited by Linnaeus, several of the species included by him under the genus he so designated have long since been referred elsewhere. By Englishmen the word Lark, used without qualification, almost invariably means the SKYLARK, *Aldaia arvensis*, which, as the best known and most widely-spread species throughout Europe, has been invariably considered the type of the genus. It scarcely needs description. Of all birds it holds unquestionably the fore-

most places in our literature, and there is hardly a poet or poetaster who has not made it his theme, to say nothing of the many writers of prose who have celebrated its qualities in passages that will be remembered so long as our language lasts. It is also one of the most favourite cage birds, as it will live for many years, in captivity, and, except in the season of moult, will pour forth its thrilling song many times in an hour for weeks or months together, while its affection for its owner is generally of the most marked kind. Difficult as it is to estimate the comparative abundance of different species of birds, there would probably be no error in accounting the Skylark the most plentiful of the Class in Western Europe. Not only does it frequent almost all unwounded districts in this quarter of the globe, making known its presence throughout spring and summer, everywhere that it occurs, by its glad and heart-lifting notes, but, unlike most birds, its numbers increase with the spread of agricultural improvement, and since the beginning of the century the extended breadth of stable land in Great Britain must have multiplied manifold the Lark-population of the country. Nesting chiefly in the growing corn, its eggs and young are protected in a great measure from all molestation, and, as each pair of birds will rear several broods in the season, their produce on the average may be set down as at least quadrupling the original stock—the eggs in each nest varying from five to three. The majority of young Larks seem to leave their birthplace so soon as they can shift for themselves, but what immediately becomes of them is one of the many mysteries of bird life that has not yet been penetrated. When the stubbles are cleared, old and young congregate in flocks, but the young then seem appear to be those only of the later broods. In the course of the autumn they give place to others coming from more northerly districts, and then as winter succeeds in great part vanish, leaving but a title of the numbers previously present. On the approach of severe weather, in one part of the country or another, flocks arrive, undoubtedly from the Continent, which in magnitude cast into insignificance all those that have hitherto inhabited the district. On the east coast of both Scotland and England this immigration has been several times noticed as occurring in a constant stream for as many as three days in succession. Further inland the birds are observed "in numbers simply incalculable," and "in countless hundreds." On such occasions the bird-catchers are busily at work with their nets or snares, so that 20,000 or 30,000 Larks are often sent together to the London market, and at the lowest estimate £2000 worth are annually sold there. During the winter of 1867-68, 1,255,500 Larks, valued at £2260, were taken into the town of Dieppe.¹ The same thing happens in various places almost every year, and many persons are apt to believe that thereby the species is threatened with extinction. When, however, it is considered that, if these birds were left to continue their wanderings, a large proportion would die of hunger before reaching a place that would supply them with food, and that of the remainder an enormous proportion would perish at sea in their vain attempt to find a settlement, it must be acknowledged that man by his wholesale massacres, which at first seem so brutal, is but anticipating the act of Nature, and on the whole probably the fate of the Larks at his hands is not worse than that which they would encounter did not his nets intervene.

The Skylark's range extends across the Old World from the Faroe to the Kurile Islands. In winter it occurs in North China, Nepal, the Punjab, Persia, Palestine, Lower Egypt, and Barbary. It sometimes strays to Madeira, and has been killed in Bermuda, though its unassisted appear-

ance there is doubtful. It has been successfully introduced on Long Island in the State of New York, and into New Zealand—in which latter it is likely to become as troublesome a denizen as any other subjects upon which Acclimatization Societies have exercised their middle-class activity. Allied to the Skylark a considerable number of species have

FIG. 1.—A, *Alauda agrestis*; B, *Alauda arvensis*.

been described, of which perhaps a dozen may be deemed valid, besides a supposed local race, *Alauda agrestis*, the difference between which and the normal bird is shown in the annexed woodcut (fig. 1), kindly lent to this work by Mr. Dresser, in whose *Birds of Europe* it is described at length. These are found in various parts of Africa and Asia.

The WOODLARK, *Alauda arvensis*, is the only other clearly-established European species of the genus, as now limited by some recent authorities. It is a much more local and therefore a far less numerous bird than the Skylark, from which it may be easily distinguished by its finer bill, shorter tail, more spotted breast, and light superciliary stripe. Though not actually inhabiting woods, as its common name might imply, it is seldom found far from trees. Its song wants the variety and power of the Skylark's, but has a resonant sweetness peculiarly its own. The bird, however, requires much care in captivity, and is far less often caged than its congener. It has by no means so wide a range as the Skylark, and perhaps the most eastern locality recorded for it is Erzeroum, while its appearance in Egypt and even in Algeria must be accounted rare.

Not far removed from the foregoing is a group of Larks characterized by a larger crest, a stronger and more curved bill, a rufous lining to the wings, and some other minor features. This group has been generally termed *Galerita*,² and has for its type the Crested Lark, the *Alauda cristata* of Linnaeus, a bird common enough in parts of France and some other countries of the European Continent, and said to have been obtained several times in the British Islands. Many of the birds of this group frequent the borders if not the interior of deserts, and such as do so exhibit a more or less pale coloration, whereby they are assimilated in hue to that of their haunts. The same characteristic may be observed in several other groups—especially those known as belonging to the Genera *Calandrella*, *Ammonomanes*, and *Certhilauda*, some species of which are of a light sandy or cream colour. The genus last named is of very peculiar appearance, presenting in some respects an extraordinary resemblance to the Hoopoe, so much so that the first specimen described was referred to the genus *Upupa*, and named *U. alaudipes*. The resemblance, however, is merely one of analogy. The Hoopoe (*q.v.*) belongs to a totally distinct Order of birds, widely differing anatomically and physiologically, and we can hardly yet assume that this resemblance is the effect of what is commonly

¹ See Yarrell (*Hist. Br. Birds*, ed. 4, i. pp. 618-621), where particular references to the above statements, and some others, are given.

² The name, however, is inadmissible, owing to its prior use in Entomology.

called "mimicry," though that may ultimately prove to be the case.

There is, however, abundant evidence of the susceptibility of the Alaudine structure to modification from external circumstances,—in other words, of its plasticity, and perhaps no homogeneous group of *Passeres* could be found which better displays the working of "Natural Selection." This fact was recognized many years ago, and ere "Darwinism" was founded as a creed, by one whose knowledge of the Alaudidae was based on the safe ground of extensive personal observation, and by one who cannot be suspected of any prejudice in favour of new-fangled notions. The remarks made by Canon Tristram (*Ibis*, 1859, pp 429-433) deserve all attention, going, as they go, to the root of the matter, and nothing but the exigencies of space precludes their reproduction here.

A monograph of the Family executed by a competent ornithologist from an evolutionary point of view could not fail to be a weapon of force in the hands of all evolutionists. Almost every character that among *Passerine* birds is accounted most sure is in the Larks found subject to modification. The form of the bill varies in an extraordinary degree. In the Woodlark (fig. 2, A), already noticed, it is almost as slender as a Warbler's, in *Anthus* it is stout; in *Certhilauda* (fig. 2, B) it is elongated and curved; in *Pyrrhuloxia* and *Melanocorypha* (fig. 3, A) it is stout and Finch-like, while in *Rhamphocorys* (fig. 3, B) it is exaggerated to an extent that surpasses almost any *Fringilline* form, exceeding in its development that found in some members of the perplexing genus *Paradoxornis*, and even presenting a resemblance to the same feature in the far-distant *Anas-tonus*—the tomsia of the maxilla not meeting those of the mandibula along their whole length, but leaving an open space between them. The hind claw, generally greatly elongated in Larks, is in *Calandrella* (fig. 4) and some other genera reduced to a very moderate size. The wings exhibit almost every modification, from the almost entire

FIG. 4.—*Calandrella beryllina*.

absorption of the first primary in the Skylark to its considerable development (fig. 5), and from tertials and scapulars of ordinary length to the extreme elongation found in the *Motacillidae* and almost in certain *Lamprolaima*. The most constant character indeed of the Alaudidae would seem to be that afforded by the *podotheca* or covering of the tarsus,

which is scutellate behind as well as in front, but a character easily overlooked.¹

In the Old World Larks are found in most parts of the Palearctic, Ethiopian, and Indian Regions, but only one genus, *Mirafra*, inhabits Australia, where it is represented by, so far as is ascertained, a single species, *M. horsfieldi*, and there is no true Lark indigenous to New Zealand. In the New World there is also only one genus, *Otocorys*,² where it is represented by two species, one of which, found over nearly the whole of North America, is certainly not

FIG. 2.—A, *Alauda arvensis*, B, *Certhilauda*.

distinguishable from the Shore-Lark of Europe and Asia, *O. alpestris*, while the other, confined to the higher elevations of more southern latitudes, seems to be the relic of a former immigration (perhaps during a glacial period) of the northern form, which has through isolation come to be differentiated as *O. chrysolaema* (see BIRDS, vol. III, p. 746). The Shore-Lark is in Europe a native of only the extreme north, but is very common near the shores of the Varanger Fjord, and likewise breeds on mountain-tops further south-west, though still well within the Arctic circle. The mellow tone of its call note has obtained for it in Lapland a name signifying "Bell-bird," and the song of the cock is lively, though not very loud. The bird trustfully resorts to the neighbourhood of houses, and even enters the villages of East Finnmark in search of its food. It produces at least two broods in the season, and towards autumn migrates to lower latitudes in large flocks. Of late years these have been observed almost every winter on the east coast of Great Britain, and the species instead of being regarded, as it once was, in the light of an accidental visitor to the United Kingdom, must now be deemed an almost regular visitor, though in very varying numbers. The observations on its habits made by Audubon in Labrador have long been known, and often reprinted.³ Other congeners of this bird are the *O. penicillata* of south-eastern Europe, Palestine, and Central Asia—to which are referred by Mr. Dresser (*B. Europe*, iv, p. 401) several other forms originally described as distinct, but the specific validity of one of them, *O. longirostris*, has since been reasserted by Dr. Scully (*Ibis*, 1881, p. 581)—as well as the *O. luteola* of Arabia and Mauritania. All these birds, which have been termed Horned Larks, from the tuft of elongated black feathers growing on each side of the head, form a little group easily recognized by their peculiar coloration, which calls to mind some of the Ringed Plovers, *Egialitis* (see KILLDEER, p. 76 of the present volume).

The name Lark is also frequently applied to many birds which do not belong to the Alaudidae as now understood.

¹ By assigning far too great an importance to this superficial character (in comparison with others), Sundevall (*Tentamen*, pp. 53-58) was induced to ally the Larks, Hoopoes, and several other heterogeneous groups in one "Series," to which he applied the name of *Scutellipalmaria*.

² By American writers it is usually called *Zonotrichia*, but that name seems to be preoccupied in natural history.

³ The osteology of this bird is minutely described by Dr. Sharpe (*Bull. U. S. Geol. Survey*, vi, pp. 119-147).

The Mud-Lark, Rock-Lark, Titlark, and Tree-Lark are *Pipits* (*q.v.*) The Grasshopper-Lark is one of the aquatic *Warblers* (*q.v.*), while the Meadow-Lark of America, as has been already said, is an *Icterus* (vol. xii. p. 697). Sand-Lark and Sea-Lark are likewise names often given to some of the smaller members of the *Lamcolæ*. Of the true Larks, *Amdaudæ*, there may be perhaps about one hundred species, and it is believed to be a physiological character of the Family that they moult but once in the year, while the *Pipits*, which in general appearance so much resemble them, undergo a double moult, as do others of the *Motacillidæ*, to which they are most nearly allied. (A. N.)

LARNACA, or LARNICA. See *CYPRUS*

LA ROCHEFOUCAULD, FRANÇOIS DE (1618-1680), the greatest maxim writer of France, one of her best memoir writers, and perhaps the most complete and accomplished representative of her ancient nobility, was born at Paris in the Rue des Petits Champs on the 16th of September 1618. His family was one of the most ancient and noble in France, counting twenty-one descents in the direct male line from Foucauld, Seigneur de la Roche in the province of Angoumois, who flourished early in the 11th century. The house of Rochevoucauld took the Protestant side for a time in the quarrels of the 16th century, but was faithful to Henry IV. in religion as in politics. La Rochevoucauld's father was a favourite of Louis XIII., and was created by him duke and peer in 1622, the possessions of the family in Angoumois and the neighbouring provinces being very considerable. The author of the *Maxims*, who during the lifetime of his father and his own most stirring years bore the title of Prince de Marillac, was somewhat neglected in the matter of education, at least of the scholastic kind; but he joined the army before he was sixteen, and almost immediately began to make a figure in public life. He had been nominally married a year before to Andrée de Vivonne, of whom little enough is known to satisfy even a Greek. She seems to have been an affectionate wife, and not a breath of scandal touches her,—two points in which La Rochevoucauld was perhaps more fortunate than he deserved. For some years Marillac continued to take part in the annual campaigns, where he displayed the utmost bravery, though he never obtained credit for much military skill. Then he fell under the influence of Madame de Chevreuse, the first of three celebrated women who successively influenced his life. Through Madame de Chevreuse he became attached to the queen Anne of Austria, and in one of her quarrels with Richelieu and her husband a wild scheme seems to have been actually formed, according to which Marillac was to carry her off to Brussels on a pillion. These caballings against Richelieu, however, had no more serious results than occasional exiles, that is to say, orders to retire to his father's estates. After the death of the great minister (1642), opportunity seemed to be favourable to the vague ambition which then animated half the nobility of France. Marillac became one of the so-called *importants*, and took an active part in reconciling the queen and Condé in a league against Gaston of Orleans. But the growing credit of Mazarin came in his way, and the *liaison* in which about this time (1645) he became entangled with the beautiful duchess of Longueville made him irrevocably a Frondeur. He was a conspicuous figure in the siege of Paris, fought desperately in the desultory engagements which were constantly taking place, and was severely wounded. In the second Fronde Marillac followed the fortunes of Condé, and the death of his father, which happened at the time (1650), gave rise to a characteristic incident. The nobility of the province gathered to the funeral, and the new duke de la Rochevoucauld took the opportunity of persuading them to follow him in an attempt on the royalist garrison of Saumur, which, however, was not

successful. We have no space to follow La Rochevoucauld through the tortuous cabals and negotiations of the later Fronde; it is sufficient to say that he was always brave and generally unlucky. His run of bad fortune reached its climax in the battle of the Faubourg Saint Antoine (1652), where he was shot through the head, and it was thought that he would lose the sight of both eyes. It was nearly a year before he recovered, and then he found himself at his country seat of Vertueil, with no result of twenty years fighting and intriguing except impaired health, a seriously embarrassed fortune, and some cause for bearing a grudge against almost every party and man of importance in the state. He spent some years in this retirement, and he was fortunate enough (thanks chiefly to the fidelity of Gonville, who had been in his service, and, passing into the service of Mazarin and of Condé, had acquired both wealth and influence) to be able to repair in some measure the breaches in his fortune. He did not, however, return to court life much before Mazarin's death. Louis XIV. was then in the full adolescence of his absolute power, and the turbulent aristocratic anarchy of the Fronde was a thing utterly of the past.

Somewhat earlier, La Rochevoucauld had taken his place in the salon of Madame de Sablé, a member of the old Rambouillet coterie, and the founder of a kind of successor to it. It was known that La Rochevoucauld, like almost all his more prominent contemporaries, had spent his solitude in writing memoirs, while the special literary employment of the Sablé salon was the fabrication of *Sentences* and *Maxims*. In 1662, however, more trouble than reputation, and not a little of both, was given to him by a surreptitious publication of his memoirs, or what purported to be his memoirs, by the Elsevirs. Many of his old friends were deeply wounded, and he hastened to deny flatly the authenticity of the publication, a denial which (as it seems, without any reason) was not very generally accepted. Three years later (1665) he published, though without his name, the still more famous *Maxims*, which at once established him high among the men of letters of the time. About the same date began the friendship with Madame de la Fayette, which lasted till the end of his life. The glimpses which we have of him henceforward are chiefly derived from the letters of Madame de Sévigné, and, though they show him suffering agonies from gout, are on the whole pleasant. He had a circle of devoted friends; he was recognized as a moralist and man of letters of the first rank; he might have entered the Academy for the asking; and in the altered measure of the times his son the Prince de Marillac, to whom some time before his death he resigned his titles and honours, enjoyed a considerable position at court. Above all, La Rochevoucauld was generally recognized by his contemporaries from the king downward as a type of the older noblesse as it was before the sun of the great monarch dimmed its brilliant qualities. This position he has retained until the present day. He died at Paris on the 17th of March 1680, of the disease which had so long tormented him.

La Rochevoucauld's character, if considered without the prejudice which a dislike to his ethical views has sometimes occasioned, is thoroughly respectable and even amiable. Like almost all his contemporaries, he saw in politics little more than a chessboard where the people at large were but pawns, and the glory and profit were reserved to the nobility. The weight of testimony, however, inclines to the conclusion that he was unusually scrupulous in his conduct, and that his comparative ill success in the struggle arose more from this scrupulousness than from anything else. He has been charged with irresolution, and there is some ground for admitting the charge so far as to pronounce him one of those the keenness of whose intellect, together with

their apprehension of both sides of a question, interferes with their capacity as men of action. But there is no ground whatever for the view which represents the *Maxims* as the mere outcome of the spite of a disappointed intriguer, disappointed through his own want of skill rather than of fortune.

Interesting, however, as he is when considered as a man and as a typical figure of a brilliant and historically important class, his importance as a social and historical figure is far inferior to his importance as a man of letters. His work in this respect consists of three parts—letters, *Memoirs*, and the *Maxims*. The letters collected by the diligence of his latest editor exceed one hundred in number, and are biographically valuable, besides displaying not a few of his literary characteristics; but they need not further detain us. The *Memoirs*, when they are read in their proper form, yield in literary merit, in interest, and in value to no memoirs of the time, not even to those of Retz, between whom and La Rochefoucauld there was a strange mixture of enmity and esteem which resulted in a couple of most characteristic portraits. But their history is unique in its strangeness. It has been said that a pirated edition appeared in Holland, and this despite the author's protest continued to be reprinted for some thirty years. It has been now proved beyond doubt or question to be a mere cento of the work of half a dozen different men, scarcely a third of which is La Rochefoucauld's, and which could only have been possible at a time when it was the habit of persons who frequented literary society to copy pell-mell in commonplace books the MS. compositions of their friends and others. Some years after La Rochefoucauld's death a new recension appeared, somewhat less incorrect than the former, but still largely adulterated, and this held its ground for more than a century. Only in 1817 did anything like a genuine edition (even then by no means perfect) appear. The *Maxims*, however, had no such fate. The author re-edited them frequently during his life, with alterations and additions; a few were added after his death, and it is usual now to print the whole of them, at whatever time they appeared, together. Thus taken, they amount to about seven hundred in number, in hardly any case exceeding half a page in length, and more frequently confined to two or three lines. The view of conduct which they illustrate is usually and not quite incorrectly summed up in the words "everything is reducible to the motive of self-interest." Though not absolutely incorrect, the phrase is misleading. The *Maxims* are in no respect mere deductions from or applications of any such general theory. They are on the contrary independent judgments on different relations of life, different affections of the human mind, and so forth, from which, taken together, the general view may be deduced or rather composed. Sentimental moralists have loudly protested against this view, yet it is easier to declaim against it in general than to find a flaw in the several parts of which it is made up. With a few exceptions La Rochefoucauld's maxims represent the matured result of the reflexion of a man deeply versed in the business and pleasures of the world, and possessed of an extraordinarily fine and acute intellect, on the conduct and motives which have guided himself and his fellows. There is as little trace in them of personal spite as of *forbearance de vice*. But the astonishing excellence of the literary medium in which they are conveyed is even more remarkable than the general soundness of their ethical import. In uniting the four qualities of brevity, clearness, fulness of meaning, and point La Rochefoucauld has no rival. His *Maxims* are never mere epigrams; they are never platitudes; they are never dark sayings. He has packed them so full of meaning that it would be impossible to pack them closer, yet there is no undue compression; he

has sharpened their point to the utmost, yet there is no loss of substance. The comparison which occurs most frequently, and which is perhaps on the whole the justest, is that of a bronze medalion, and it applies to the matter no less than to the form. Nothing is left unfinished, yet none of the workmanship is finical. The sentiment, far from being merely hard as the sentimentalists pretend, has a vein of melancholy poetry running through it which calls to mind the traditions of La Rochefoucauld's devotion to the romances of chivalry. The maxims are never shallow; each is the text for a whole sermon of application and corollaries which any one of thought and experience can write. Add to all this that the language in which they are written is French, still at almost its greatest strength, and chastened but as yet not emasculated by the reforming influence of the 17th century, and it is not necessary to say more. To the literary critic no less than to the man of the world La Rochefoucauld ranks among the scanty number of pocket-books to be read and re-read with ever new admiration, instruction, and delight.

The editions of La Rochefoucauld's *Maxims* published in his lifetime bear the dates 1665 (*édité par l'auteur*), 1668, 1671, 1675, 1678. An important edition which appeared after his death in 1698 may rank almost with these. As long as the *Memoirs* remained in the state above described no edition of them need be mentioned, and none of the complete works was possible. There have been several editions more or less complete in the last seventy years, but they are all thrown into the shade by that of MM. Gibert and Gourdan, 1868-81, in the series of *Grands Écrivains de la France*, 3 vols. This is complete as to the text, but a glossary and some other additional matters have yet to appear. The handsomest separate edition of the *Maxims* is the so-called *Édition de Dictionnaire*, 1870, but cheap and hasty sales are plentiful (G. S.).

LA SALLE, chief city of La Salle county, Illinois, U.S., is situated on the right bank of the Illinois river, navigable up to this point, about 80 miles south-west of Chicago, with which it is connected by the Illinois and Michigan Canal as well as by rail. La Salle is a rising commercial city, with manufactures of glass, sulphuric acid, and soda-ash, and some export of ice, as well as extensive zinc rolling mills—the only works of the kind in the United States. The supply of bituminous coal in the vicinity is large, the output of the mines being 1,000,000 tons annually. The population in 1880 was 7847.

LA SALLE, ROBERT CAVELIER, SIEUR DE (1643-1687), a French explorer in North America, was born at Ronen in November 1643. He became a settler in Canada, and about 1669, leaving his trading post at La Chine, above Montreal, he sought to reach China by way of the Ohio, supposing, from the reports of Indians, this river to flow into the Pacific. He made explorations of the country between the Ohio and the lakes, but, when Joliet and Marquette made it evident that the main river Mississippi emptied in the Gulf of Mexico, he conceived a vast project for extending the French power in the lower Mississippi valley, and thence attacking Mexico. He obtained extensive grants from the French Government, rebuilt Fort Frontenac, established a post above Niagara Falls, and built a small vessel, in which he sailed up the lakes to Green Bay. Thence, despatching his vessel freighted with furs, he proceeded with the rest of the party, in boats and on foot, to the Illinois river, near the head of which he began a post called Fort Crève Cœur, and a vessel in which to descend the Mississippi from the mouth of the Illinois, and, leaving Tonty, with five men, at Fort Crève Cœur, he returned by land to Canada. Towards the close of 1681 La Salle, with a party in canoes, again reached the head of Lake Michigan, at the present site of Chicago, and, making

¹ The full original title was *Reflexions ou Sentences de Maximes Morales*.

the long portage to the Illinois, descended it to the Mississippi, which he followed to its mouth, where he set up a cross and the arms of France, April 9, 1682. La Salle fell sick on his voyage up the river, and sent on intelligence of his success, which was carried to France by Father Maubré, and was published in Hennepin's work in 1683. When La Salle reached France, projects were taken up by the Government for an expedition against the rich mining country of northern Mexico. Plans were submitted by La Salle and by Peñalosa, a renegade Spaniard, who, while governor of New Mexico in 1662, had penetrated apparently to the Mississippi. La Salle was accordingly sent out in July 1684, with four vessels and a small body of soldiers, ostensibly to found an establishment at the mouth of the Mississippi, but really to push on and secure a favourable base of operations, and gain the aid of the Indians against the Spaniards, while awaiting a more powerful force under Peñalosa. The design was so well masked, and subsequently misrepresented, that he is generally said to have been carried beyond the Mississippi by the treachery of Beaugue, a naval officer commanding one of the vessels. After running along the coast, La Salle returned to Espiritu Santo Bay, Texas. There he landed his soldiers, but lost one vessel with valuable stores. He refused Beaugue's offer to obtain aid for him from the West Indies, and when that officer, according to his orders, sailed back, La Salle put up a rude fort. Then for two years, from January 1685 to January 1687, he wasted the time in aimless excursions by land, never getting beyond the present limits of Texas, and making no attempt to explore the coast or reach the Mississippi with his remaining vessel. His colonists and soldiery dwindled away; no reinforcements or expedition under Peñalosa arrived; and in January 1687, leaving part of his force at Fort St. Louis, he set out with the rest to reach Canada by way of the Mississippi to obtain relief. His harshness and arbitrary manner had provoked a bitter feeling among his followers, and he was assassinated on the 19th of March, near the Trinity river. Some of the survivors reached Touhy's post on the Arkansas, and returned to France by way of Canada. The party left at the fort were nearly all cut off by the Indians, a few survivors having been rescued by a Spanish force sent to root out the French.

For the various operations of La Salle, the chief works are Hennepin's *Description of Louisiana*, 1683; Le Clercq's *Establishment of the Faith*, 1681; Touhy's *Narrative* (1687), and Joutel's (1711), and the immense collection of documents published by Magry (8 vols. 8vo, Paris, 1875-78). Hennepin and Le Clercq's accounts were published partially in Shea's *Discovery of the Mississippi*, 1852, and recently entire. La Salle's early explorations have been discussed by Thuillier, Verreau, and Shea; historical scholars generally rejecting the claims set up by Magry. Parkman gives La Salle's whole career in his *Discovery of the Great West*, modified, however, greatly in his *La Salle*, Boston, 1870. (J. G. S.)

LASCAR, an Anglo-Persian term (from *laskhar*, an army), which formerly meant a non-combatant, or public follower of the ordnance department. Later on it came to mean any supernumeraries, and especially the native sailors engaged to supplement the crews of European vessels in the Eastern waters. The term is at present applied generally to the seafaring populations of the Indian seaboard manning British vessels sailing between England and the East. The Peninsular and Oriental and other large steamship companies now employ the lascars almost exclusively, preferring them to European crews on account of their greater docility, temperance, and obedience to orders. Nearly all are Mohammedans, and, besides their several native tongues, speak among themselves a sort of lingua franca based on Hindustani, with a considerable admixture of English, Arabic, and other elements. The word lascar is still applied somewhat in its former sense to tent-pitchers, inferior artillerymen, coolies, or sutlers.

LASCARIS, CONSTANTINE (? -1493), an eminent Greek scholar, was a member of the family which in the 13th century had furnished three emperors of Nicea, and was born at Constantinople, but in what year is unknown. After the fall of Constantinople in 1453, he took refuge in Italy, where Francesco Sforza, duke of Milan, appointed him Greek tutor to his daughter Hippolyta, afterwards married to Alphonso, king of Naples. It was at Milan that Zaret published in 1476 the *Grammatica Græca, sive Compendium octo Oratorum Partium*, of Lascaris, remarkable as being the first book entirely in that language issued from the printing press. After leaving Milan, Lascaris taught for some time in Rome and in Naples, but ultimately, on the invitation of the inhabitants, settled in Messina, where he continued to teach publicly until his death in 1493. Among his numerous pupils here was the celebrated Pietro Bembo. Lascaris bequeathed his library of valuable MSS to the senate of Messina; the collection was afterwards carried off to Spain and lodged in the Escorial.

Besides the *Grammatica*, which has often been reprinted, Lascaris wrote little of any kind and nothing of any value apart from the importance which attaches to his position as one of the promoters of the revival of Greek learning in Italy. Two little treatises by him on Siolians and Calabrians who had written in Greek were first published by Manrolio in 1563, and afterwards reprinted by Zaccaria in the *Bibliotheca di Storia Letteraria*. His dissertation on Ophiurus is to be found in the first volume of the *Marmorata Tournefortii*. Inerte gives some letters of Lascaris in the *Epistole Epirotae Matritenses Codices Græci manuscripti*. See Vilemann, *Lascaris, ou les Grecs du quinzième siècle*, Paris, 1825.

LASCARIS, JOANNES or JANUS (c. 1445-1535), surname Rhyndacenus from the river Rhyndacus in Bithynia, his native province, was born about 1445. He was a member of the imperial family of Lascaris, and after the fall of Constantinople fled into Italy, where ultimately he found refuge at the court of Lorenzo de' Medici, whose intermediary he was with the sultan Bajazet II. In the purchase of Greek MSS for the Medicean library. On the expulsion of the Medici from Florence, he, at the invitation of Charles VIII. of France, removed to Paris (1495), where he taught publicly, although he does not appear to have had any official or salaried connexion with the university. Among his pupils were Gulielmus Budæus and Danæsius. By Louis XII. he was several times employed on various public missions; and in 1515 he appears to have accepted the invitation of Leo X. to take charge of the Greek college he had founded at Rome. We afterwards find Lascaris employed along with Budæus by Francis I. in the formation of the royal library at Fontainebleau, and also again sent in the service of the French crown to Venice. He died at Rome in 1535.

He edited or wrote *Anthologia Epigrammatum Græcorum*, in seven books, Florence, 1494; *Cathecismi Hymni, cum Scholiis Græcis*, Florence, about 1494; *Scholæ Græcæ in Theodori, in integrum restituta*, Rome, 1517; *Homæcarum questionum liber, et de Nympharum antro in Olympe opusculum*, Rome, 1518; *De versu Græcorum liberum forma ac campis apud antiquos*, Paris, 1528. See Jovius, *Elogia clarorum virorum*; Hody, *De Græcis Illustribus*; and Bayle's *Dictionary*, s.v.

LAS CASAS, BARTOLOMÉ DE (1474-1556), for some time bishop of Chiapa in Mexico, and known to posterity as "The Apostle of the Indies," was a native of Seville, where he was born in 1474. His father, one of the companions of Columbus in the voyage which resulted in the discovery of the New World, was rich enough to be able to send him to Salamanca, where he graduated. In 1498 he accompanied his father in an expedition under Columbus to the West Indies, from which he returned in 1500; and in 1502 he went with Nicolás de Orando, the governor, to Hayti, where eight years afterwards he was admitted to priestly orders, being the first person to receive that consecration in the colonies. In 1511, the conquest of Cuba having been resolved on, he passed over to that island to

take part in the work of "population and pacification," and in 1513 or 1514 he witnessed and vainly endeavoured to check the fearful massacre of Indians at Caonao. Soon afterwards there was assigned to him and his friend Renteria a large village in the neighbourhood of Xagua, with a number of Indians attached to it in what was known as a "repartimiento" (allotment), and like the rest of his countrymen he sought to make the most of this opportunity for growing rich, but at the same time he occasionally celebrated masses and preached. Soon, however, having become deeply convinced of the injustice and other moral evils connected with the repartimiento system, he began to preach against it, at the same time giving up his own slaves. With the consent of his partner he resolved to go to Spain in the cause of the oppressed natives, and the result of his representations was that in 1516 Cardinal Jimenez caused a commission of three Hieronymites to be sent out for the reform of abuses, Las Casas himself, with the title of "protector of the Indians" being appointed, with a salary, to advise and inform them. This commission had not been long at San Domingo, however, before Las Casas became painfully aware of the indifference of his coadjutors to the cause which he himself had so closely at heart, and July 1517 found him again in Spain, where he developed his scheme for the complete liberation of the Indians,—a scheme which not only included facilities for emigration from Spain, but was intended to give to each Spanish resident in the colonies the right of importing twelve negro slaves. The emigration movement proved a failure, and Las Casas lived long enough to express his sorrow and shame for having been so slow to perceive that the Africans were as much entitled to the rights of man as were the natives of the New World. Overwhelmed with disappointment, he retired to the Dominican monastery in Hayti, where he joined the order in 1522, and devoted eight years of extreme seclusion to the acquisition of that store of classical and scholastic learning which appears so curiously in all his writings. About 1530 he appears to have revisited the Spanish court, but on what precise errand or with what result is not known, the vagueness and confusion of the records of this period of his life extends to the time when, after visits to Mexico, Nicaragua, Peru, and Guatemala, in the cause of religion and of his order, he undertook an expedition in 1537 into Tuzulutlan or the Tierra de Guerra ("Land of War"), the inhabitants of which were, chiefly through his tact and skill, peaceably converted to Christianity, mass being celebrated for the first time amongst them in the newly founded town of Rabinal in 1538. In 1539 Las Casas was sent to Spain to obtain Dominican recruits, and through Loaysa, general of the order, and confessor of Charles V., he was successful in obtaining many royal orders and letters which were supposed to be favourable to his enterprise, among others that which prohibited for the time being the entrance of any lay Spaniard into Tuzulutlan. During this stay in Europe, which lasted more than four years, he more than once visited Germany to see Charles, whom the business of the empire was detaining there; he also (1542) wrote his *Veinte Razonas* ("Twenty Reasons") in defence of the liberties of the Indians and the *Brevesima Relacion de la Destruccion de las Indias*, the latter of which was published some twelve years later, and has since been translated into several European languages. In 1543 he refused the Mexican bishopric of Cuervo, but was prevailed upon to accept that of Chiapa, for which he sailed in 1544. Thwarted at every point by the officials, and outraged with passionate hatred by his countrymen in his attempt to carry out the "new laws" which his humanity had procured (see the "*Remedios que refirio*" in the Seville edition of his *Obras*, 1552), he returned to Spain and

resigned his dignity three years afterwards (1547). In 1550 he met Sepúlveda in public debate on the theses drawn from the recently published *Apologia pro Libro de Justia Belli Covae*, in which the latter had maintained the lawfulness of waging unprovoked war upon the natives of the New World. The course of the discussion may still be traced in the account of the "Disputa" contained in the *Obras* (1552). In 1555 Las Casas successfully remonstrated with Philip II. against the financial project for selling the reversion of the "encomiendas"—a project which would have involved the Indians in hopeless bondage. In July of the following year he died at Madrid, whither he had gone to urge (and with success) the necessity of restoring a court of justice which had been repressed in Guatemala.

A *Historia de las Indias* was left by Las Casas to the convent of San Gregorio at Valladolid, with directions that it should not be printed for fifty years. Herrera, however, was permitted to consult it for his *Historia General* (1601). It afterwards lay neglected until the Royal Academy of History took it up with an intention of publishing it. That intention was afterwards abandoned, Prescott, who appears to have seen the MS., hopes that it may yet be given to the world. *Sketches of the Life of Las Casas* have been given by Llorente and by Quintana. The English reader will find adequate notices in the appendix to bk. II., chap. viii., of Prescott's *Conquest of Mexico*, and in the copious monograph of Sir Arthur Helps (*Life of Las Casas*, 1868).

LÁSCO, or LASCOT, JOHN See ALASCO, vol. i. p. 443.

LASSA. See LHASA.

LASSALLE, FERDINAND (1825-1864), the originator of the social-democratic movement in Germany, was born at Breslau in 1825. Like Karl Marx, the chief of international socialism, he was of Jewish extraction. His father, a prosperous merchant in Breslau, intended Ferdinand for a business career, and with this view sent him to the commercial school at Leipzig; but the boy, having no liking for that kind of life, got himself transferred to the university, first at Breslau, and afterward at Berlin. His favourite studies were philology and philosophy, he became an ardent Hegelian, and in politics was one of the most advanced. Having completed his university studies in 1846, he began to write a work on Heracleitus from the Hegelian point of view, but it was soon interrupted by more stirring interests, and did not see the light for many years. From the Rhine country, where he settled for a time, he went to Paris, and made the acquaintance of his great compatriot Heine, who conceived for him the deepest sympathy and admiration. In the letter of introduction to Varnhagen von Ense, which the poet gave Lassalle when he returned to Berlin, there is a striking portrait of the young man. Heine speaks of his friend Lassalle as a young man of the most remarkable endowments, in whom the widest knowledge, the greatest abstinence, and the richest gifts of expression are combined with an energy and practical ability which excite his astonishment, but adds, in his half-mocking way, that he is a genuine son of the new era, without even the pretence of modesty or self-denial, who will assert and enjoy himself in the world of realities. At Berlin Lassalle became a favourite in some of the most distinguished circles; even the veteran Humboldt was fascinated by him, and used to call him the *Wunderkind*. Here it was, also, towards the end of 1846, that he met the lady with whom his life was to be associated in so remarkable a way, the Countess Hatzfeldt. She had been separated from her husband for many years, and was at feud with him on questions of property and the custody of their children. With characteristic energy Lassalle attached himself to the cause of the countess, whom he believed to have been outrageously wronged, made a special study of law, and, after bringing the case before thirty-six tribunals, reduced the powerful count to a compromise on terms most favourable to his client. The process, which lasted ten years, gave rise to not a little scandal, especially

that of the *Cassettengeschichte*, which pursued Lassalle all the rest of his life. This "affair of the casket" arose out of an attempt by the countess's friends to get possession of a bond for a large life annuity settled by the count on his mistress, a Baroness Meyendorf, to the prejudice of the countess and her children. Two of Lassalle's comrades succeeded in carrying off the casket, which contained the lady's jewels, from the baroness's room at a hotel in Cologne. They were prosecuted for theft, one of them being condemned to six months' imprisonment; Lassalle, accused of moral complicity, was acquitted on appeal. He was not so fortunate in 1849, when he underwent a year's durancé for resistance to the authorities at Düsseldorf during the troubles of that stormy period. But going to prison was quite a familiar experience in Lassalle's life. Till 1859 Lassalle resided mostly in the Rhine country, presenting the suit of his friend the countess, finishing the work on Heraclitus, which was not published till 1858, and taking little part in political agitation, but ever a helpful friend of the working men. He was not allowed to live in Berlin because of his connexion with the disturbances of '48. In 1859, however, he entered the city disguised as a carter, and finally, through the influence of Humboldt with the king, got permission to stay there. The same year he published a remarkable pamphlet on the *Italian War and the Mission of Prussia*, in which he came forward to warn his countrymen against going to the rescue of Austria in her war with France. He pointed out that if France drove Austria out of Italy she might annex Savoy, but could not prevent the restoration of Italian unity under Victor Emmanuel. France was doing the work of Germany by weakening Austria, the great cause of German disunion and weakness; Prussia should form an alliance with France in order to drive out Austria, and make herself supreme in Germany. After their realization by Bismarck these ideas have become sufficiently commonplace; but they were nowise obvious when thus published by Lassalle. In 1861 he published a great work in two volumes, the *System of Acquired Rights*.

Hitherto Lassalle had been known only as the author of two learned works, as connected with an extraordinary lawsuit which had become a wide-spread scandal, and as a young man of whom even the most distinguished veterans expected great things. Now began the short-lived activity which was to give him an historical significance. It was early in 1865, when the struggle of Bismarck with the Prussian liberals was already begun. Lassalle, who had always been a democrat of the most advanced type, saw that an opportunity had come for asserting a third great cause—that of the working men—which would outflank the liberalism of the middle classes, and might even command the sympathy of the Government. His political programme was, however, entirely subordinate to the social, that of bettering the condition of the working-classes, for which he believed the schemes of Schulze-Dehtzsch were utterly inadequate. Lassalle flung himself into the career of agitator with his accustomed vigour. His worst difficulties were with the working men themselves, among whom he met the most discouraging apathy. For a war to the knife with the liberal press he was quite prepared, and he accepted it manfully. His mission as organiser and emancipator of the working class lasted only two years and a half. In that period he issued about twenty separate publications, most of them speeches and pamphlets, but one of them, that against Schulze-Dehtzsch, a considerable treatise, and all full of keen and vigorous thought. He founded the "Allgemeiner Deutscher Arbeiterverein," was its president and almost single handed champion, conducted its affairs, and carried on a vast correspondence, not to mention about a dozen state prosecutions in which he was during that period

involved. Berlin, Leipzig, Frankfurt, and the industrial centres on the Rhine, were the chief scenes of his activity. His greatest success was on the Rhine, where in the summer of 1863 and 1864 his travels as missionary of the new gospel resembled a triumphal procession. The agitation was growing rapidly, but he had achieved little substantial success when a most unworthy death closed his career.

While posing as the Messiah of the poor, Lassalle was a man of decidedly fashionable and luxurious habits. His suppers were well known as among the most exquisite in Berlin. It was the most piquant feature of his life that he, one of the gilded youth, a connoisseur in wine, and a learned man to boot, had become agitator and the champion of the working man. In one of the literary and fashionable circles of Berlin he had met a young lady, a Fraulein von Donniges, for whom he at once felt a passion, which was ardently reciprocated. In the summer of 1864 he met her again on the Rigi, when they resolved to marry. She was a young lady of twenty, decidedly unconventional and original in character, but the daughter of a Bavarian diplomatist then resident at Geneva, who was angry beyond all bounds when he heard of the proposed match, and would have absolutely nothing to do with Lassalle. The lady was imprisoned in her own room, and soon, apparently under the influence of very questionable pressure, renounced Lassalle in favour of another admirer, a Wallachian, Count von Racowitza. Lassalle, who had resorted to every available means to gain his end, was now mad with rage, and sent a challenge both to the lady's father and her betrothed, which was accepted by the latter. At the Carouge, a suburb of Geneva, the meeting took place on the morning of August 28, 1864, when Lassalle was mortally wounded. In spite of such a foolish ending, his funeral was that of a martyr; and by many of his adherents he has been regarded since with feelings almost of religious devotion.

Lassalle did not lay claim to any special originality as a socialistic thinker, nor did he publish any systematic statement of his views. His aim was not scientific or theoretic completeness, but the practical one of organising and emancipating the working classes, and his plans were promulgated in occasional speeches and pamphlets, as the crises of his agitation seemed to demand. Yet his leading ideas are sufficiently clear and simple. Like a true Hegelian he saw three stages in the development of labour: the ancient and feudal period, which, through the subjection of the labourer, sought solidarity without freedom; the reign of capital and the middle classes, established in 1789, which sought freedom by destroying solidarity; and the new era, beginning in 1848, which would reconcile solidarity with freedom by introducing the principle of association. It was the basis and starting-point of his opinions that, under the empire of capital and so long as the working man was merely a receiver of wages, no improvement in his condition could be expected. This position he founded on the well-known law of wages formulated by Ricardo, and accepted by all the leading economists, that wages are controlled by the ordinary relations of supply and demand, that a rise in wages leads to an increase in the labouring population, which, by increasing the supply of labour, is followed by a corresponding fall of wages. Thus, population increases or decreases in fixed relation to the rise or fall of wages. The condition of the working man will never permanently rise above the mere standard of living required for his subsistence, and the continued envy of his kind. Lassalle held that the co-operative schemes of Schulze-Dehtzsch on the principle of "self-help" were utterly inadequate, for the obvious reason that the working classes were destitute of capital. The struggle of the working man helping himself

with his empty pockets against the capitalists he compared to a battle with teeth and nails against modern artillery. In short, Lassalle accepted the orthodox political economy to show that the inevitable operation of its laws left no hope for the working classes, and that no remedy could be found but by abolishing the conditions in which these laws had their validity—in other words, by abolishing the present relations of labour and capital altogether. And this could only be done by the productive association of the working men with money provided by the state. The states of Europe had spent hundreds of millions in silly dyastic squabbles, or to appease the wounded vanity of royal mistresses; why refuse to advance a few millions to solve the greatest problem of modern civilization? Lassalle's estimate was that a loan of a hundred million thalers would be more than enough to bring the principle of productive association into full movement throughout the kingdom of Prussia. And he held that such association should be the voluntary act of the working men themselves, the Government merely reserving to itself the right to examine the books of the various societies. All the arrangements should be carried out according to the rules of business usually followed in such transactions. But how move the Government to grant such a loan? Simply by introducing (direct) universal suffrage. The working men were an overwhelming majority, they were the state, and should control the Government. The aim of Lassalle, then, was to organize the working classes into a great political power, which in the way thus indicated, by peaceful resolute agitation, without violence or insurrection, might attain the goal of productive association. In this way the fourth estate would be emancipated from the despotism of the capitalist, and a great step taken in the solution of the great "social question."

It will be seen that the net result of Lassalle's life was to produce a European scandal, and to originate a socialist movement in Germany, which, in spite of repressive laws, at last election (1881) was able to return thirteen members to the reichstag. This result was hardly commensurate with his ambition, which was boundless. In the heyday of his passion for Fraulein von Dönniges, his dream was to be enthroned as the president of the German republic with her seated at his side. With his energy, ability, and gift of dominating and organizing, he might indeed have done a great deal. Bismarck courted with him as the representative of a force that might help him to combat the Prussian Liberals; so late as 1878, in a speech before the reichstag, he spoke of him with deep respect, as a man of the greatest amiability and ability from whom much could be learned. Even Bishop Ketteler of Mainz had declared his sympathy for the cause he advocated.

Lassalle's two learned works were *Die Philosophie Heraklitos des Dunklen von Ephesos* (Berlin, 1868), and *das System der erworbenen Rechte* (Leipzig, 1861), both marked by great learning and intellectual power. But of far more historical interest are the speeches and pamphlets connected with his socialist agitation, of which the most important are: *Über Verfassungsveränderung; Arbeiterprogramm; Offenes Antwortschreiben; Zur Arbeiterfrage; Arbeiterrecht; Herr Bastiat-Schulze von Delitzsch, über Kapital und Arbeit*. His drama, *Fräulein von Sickingen*, published in 1870, is a work of no poetic value.

The best authority on Lassalle's life and writings is George Brandes's Danish work, *Ferdinand Lassalle* (German translation, Berlin, 1877). See also Laveleye, *Le socialisme contemporain*, Paris, 1881; *Fortnightly Review*, 1880; *Contemporary Review*, 1881. There is already a considerable literature on his love affair and death.—*Meine Begegnungen mit F. Lassalle*, by Helene von Raasow-Ha, a very strange book; *Zusammenhänge über das tragische Leben und F. Lassalle's* by B. Becker; *Im Anschluss an die Memoren der F. von Raasow-Ha*, by A. Kutschbach; and an English and Italian novel.

(T. K.)

LASSEN, CHRISTIAN (1800–1876), an eminent Orientalist, was born on October 22, 1800, at Bergen in Norway.

Having received his first university education at Christiania, he went to Germany, and continued his philological studies at Heidelberg and Bonn. The latter university, though only founded a few years previously (in 1818), had already become one of the chief centres of Oriental studies. The lectures of A. W. von Schlegel, the distinguished critic and leader of the German Romantic school, who shares with F. Bopp the honour of having founded the critical school of Sanskrit philology, were especially attractive to the young Norwegian, and determined him henceforth to devote his energies chiefly to the exploration of the newly-opened mine of Indian literature. Having acquired a sound knowledge of Sanskrit, he spent three years in Paris and London, engaged in copying and collating MSS., and collecting materials for future research, especially in reference to the Hindu drama and philosophy. During this period he published, jointly with E. Burnout, his first work, *Essai sur le Pals* (Paris, 1826). On his return to Bonn he studied Arabic, for some time, under Freytag, and took the degree of Ph.D., his dissertation discussing the Arabic notices of the geography of the Punjab (*Commentatio geographica atque historica de Pentapotamia Indica*, Bonn, 1827). Soon after he was admitted privatdocent, and entered on his academic career with an inaugural dissertation *De Taprobane insula*. In 1830 he was appointed "extraordinary" and in 1840 "ordinary" professor to the newly-created chair of Old Indian language and literature, Schlegel continuing to hold (till his death in 1848) the chair of history. In spite of a tempting offer of the Sanskrit chair at Copenhagen, in 1841, Lassen remained faithful to the university of his adoption to the end of his life. He died at Bonn on May 8, 1876, having been affected with almost total blindness for many years. As early as 1864 he was relieved of the duty of lecturing.

The numerous works and essays published by Lassen during half a century of unremitting labour, cover a wide field of Oriental research, and afford ample evidence of the thorough accuracy of his scholarship and the comprehensiveness of his learning. In 1828–31 he brought out, in conjunction with Schlegel, the first critical edition of the *Uttarapades*, the now well-known manual of political ethics in the form of fables, interspersed with moral maxims. The appearance of this edition marks the starting-point of the critical study of the Sanskrit literature. At the same time Lassen assisted his teacher and friend in editing and translating the first two cantos of the epic *Sikandrapurana* (1830–38). In 1839 he brought out the text of the first act of Bharavahita's drama, *Mālatīmādhava*, and a complete edition, with a Latin translation, of the *Sāṅkhya-kārikā*, one of the chief works of the Sāṅkhya philosophy. In 1847 followed his edition and translation of Jayadeva's charming lyrical drama, *Gitaṅgoda*, and his *Institutiones linguae Praeriticae*, which still forms the standard work on the popular dialects of the Indian drama. His *Anthologia Sanscritica*, which came out the following year, contained several hitherto unpublished texts, and did much to stimulate the study of Sanskrit in German universities, where, indeed, it continues to be used, new editions of it having been published by Gildemeister in 1865 and 1868. In 1845 Lassen brought out a new and improved edition of Schlegel's text and translation of the famous philosophical episode of the *Mahābhārata*, the "Bhagavadgītā." He did not, however, confine himself to the study of Indian languages, but acted likewise as a scientific pioneer in other fields of philology. In his *Zeitschrift zur Kunde der Indischen Alterthümer* (1845), he prepared the way for the correct interpretation of the Umbrian inscriptions; and the *Zeitschrift für die Kunde des Morgenlandes* (7 vols., 1837–50), started and conducted by him,—the first three volumes in conjunction with Ewald and Rodiger,—contains, among other valuable papers from his pen, grammatical sketches of the Beluchi and Brakui languages, and an essay on the Lycian inscriptions. Soon after the appearance of Burnout's *Commentaire sur le Yagna* (1838), Lassen also directed his attention to the Zend, and to Iranian studies generally; and in his work *Die altperischen Keilschriftenschriften von Persepolis* (1848) he first made known the true character of the Old Persian cuneiform inscriptions, thereby anticipating, by one month, Burnout's *Mémoire* on the same subject, while Major (Sir Henry) Rawlinson's famous memoir on the Behistun inscription, though drawn up in Persia, independently of contemporaneous European research, at about the same time, did not reach the Royal Asiatic Society until three years later. Subsequently Lassen published, in the sixth volume of his

journal (1845), a complete collection of all the Old Persian cuneiform inscriptions known up to that date. He also was the first scholar in Europe who took up, with signal success, the decipherment of the newly-discovered Babylonian coins, which furnished him the materials for his important essay, *Zur Geschichte der griechischen und indo-egyptischen Könige in Babylon, Kabin, und Indien* (1838). He likewise contemplated bringing out a critical edition of the *Pandua*, but, after publishing the first five targads (1862), he felt that his whole energies were required for the successful accomplishment of the great undertaking of his life, with which his name will always be inseparably connected—his *Indische Alterthümer*. In this work—completed in four volumes, published successively in 1847 (2d ed., 1867), 1849 (2d ed., 1874), 1858, and 1861—which forms one of the greatest monuments of untiring industry and critical scholarship, everything that could be gathered from native and foreign sources, relative to the political, social, and intellectual development of India, from the earliest times down to Mohammedan invasion, was worked up by him into a connected historical account. Only those acquainted with Indian history and literature, where nothing is fixed, can realize the enormous difficulty of the task, but in spite of much that may turn out to be erroneous, and in spite of still more that is, from the nature of the subject, must always be uncertain and hypothetical, there can be no doubt that Lassen has laid in this work a solid foundation for future Indian historical and antiquarian research.

LATAKIA, or **LADIKIYEH**, a seaport town of Syria, situated opposite the island of Cyprus, about 73 miles north of Tlepia, and administratively dependent on the mutasarrif of that city. It is a rather poor-looking place; but, besides being the most important town of a considerable district, the residence of several foreign consuls, and the seat of an American mission, it has considerable historical interest. Remains of the Roman period are still to be seen, the best preserved of which is a sort of triumphal arch hypothetically assigned to the time of Septimius Severus. As a trading port Latakia has recently declined. The harbour, about a mile from the town, is naturally small, and has been silted up so as to be serviceable only for the lesser native craft. The Russian and French steamers, which make Latakia a point of call, lie in the roadstead, and the whole trade of the place, with Egypt and European countries, does not exceed the value of £100,000 per annum. The great article of export is the famous Latakia tobacco, mainly purchased by Egypt and England. It is grown among the Nosairiyeh hills, and the hillmen, each with his little plot of ground, bestow great care on the cultivation of the plant. The best and most fragrant is brought from the districts of Dyrus and Amamareh. Consul Jago gives the population of the town as about 12,000 in 1874; other estimates vary from 5000 to 14,000.

The oldest name of the town, according to Herennius Philo, was *Papusa* or *Aech*, it received that of *Leodice* (*ad mare*) from Seleucus Nicator, who founded it in honour of his mother as one of the four "new" cities of Syrian Tetrarchy (Antioch, Seleucia, Apamea, *Leodice*). In the Roman period it was favoured by Julius Caesar, and took the name of *Julia*, and, though it suffered severely when Dolabella was besieged within its walls (48 B.C.), Strabo describes it as a flourishing port, which supplied, from the vineyards on the mountains, the greater part of the wine imported to Alexandria. The town received the privileges of an Italian colony from Severus, for taking his part against Antioch in the struggle against Niger. *Leodice* was the seat of an ancient bishopric, and even had some claim to metropolitan rights. At the time of the Crusades, "Lacie," as Jacques de Vitry says it was popularly called, was a wealthy city. It fell to Tancred with Antioch in 1109, and was recovered by Saladin in 1188. A Christian settlement was afterwards permitted to establish itself in the town, and to protect itself by fortifications; but it was expelled by Sultan Kildar and the defences destroyed. By the 16th century *Leodice* had sunk very low; the revival in the beginning of the 17th was due to the new trade in tobacco. The town has several times been almost destroyed by earthquakes—in 1170, 1287, and 1822.

LATHE. In its simplest form—a form which is still employed by the natives of India—the lathe consists of two upright posts each carrying a fixed pin or dead centre, between which the work in hand is caused to revolve by an assistant pulling alternately the two ends of a cord passed

round it. A tool held firmly on a bar which forms a "rest" then attacks in succession the projecting parts, and in this way the entire surface is brought to an equal distance from the central axis, in other words, the cross section becomes everywhere circular.

Fig. 1 shows a "dead-centre lathe" of the kind used in Europe during the 18th century, in which the centres are

FIG. 1.—Dead-centre Lathe

carried by "puppets" or "poppets" which can be adjusted to suit the length of the work, the tuner giving the rotation by means of the treadle and spring-latch attached to the ceiling. This lathe, having immortalized itself by giving its name to the "lathe," has now almost entirely disappeared, the waste of time in its upward stroke (during which the work revolves in the wrong direction) being a fatal objection to its use in an age in which economy in that respect is of such importance. Dead-centre lathes themselves are now almost things of the past, though within their own limits,—which are of course confined to such articles as are turned on the outside only, and can be supported at the ends (such as fig. 2)—they offer a steadiness of support and a freedom of rotation which others seldom equal and never surpass. The system, however, still survives in the small lathes or "throws" used by Fig. 2. watch and clock makers, and for their purposes it is not likely to be soon superseded.

The lathe seems to have but tardily developed into the "foot-lathe," the application to it of a fly-wheel worked by a crank and treadle having been exceptional rather than usual even in the early part of the present century, though a separate fly-wheel turned by an assistant had long previously been employed, and must have rendered possible the turning of heavy work which could not have been attempted without it. The nave of cart wheels were doubtless a case in point, and for these as well as for many other purposes detached fly-wheels still render good service where steam or other motive power is not available.

The early attempts at modifying the dead-centre lathe so that articles such as fig. 3 could be turned "en l'air," or without the support of a "back-centre," cannot have been very encouraging. The introduction of a spindle or mandrel carrying a pulley for the lathe band and screwed at one

FIG. 3

and so that the work could be attached to it was a tolerably obvious mode of effecting it, a "headstock" resembling fig. 4 being the result. But the discarding of the dead-centre point and the substitution of a front bearing—a step which was essential to setting free the end of the mandrel, and so enabling it to carry the work—must have been accompanied by a loss of power and an amount of unsteadiness which quite account for the tenacity with which the simple pole-lathe and the very similar "spring-bow lathe" survived, and make it improbable that the mandrel was at first ever used in cases for which the older form was admissible. For even if it had been possible with the then existing means to render a mandrel sufficiently true, and to obtain an accurate fit between it and the bearing in which it revolved, wrong ideas prevailed as to the best form to be given to it,—the question indeed having only become a settled one within the memory of persons now living, after various unsatisfactory patterns had been tried and discarded. It is a matter of great importance, since the proper performance of a lathe is mainly dependent on the mandrel's maintaining a thoroughly good fit.

The types of modern lathes are as various as are the occupations of those who use them. The mechanic, the soft-wood turner, and the amateur, for instance, differ so greatly in their requirements that a lathe which would be well suited to the one would be very ill adapted, even if not wholly useless, to the other. Thus the professional turner of soft wood, with a lathe of which the frame and even the fly-wheel are of timber (its value in shillings being not very different from the price of an amateur's lathe in pounds) will use a high rate of speed and sharp tools and

Fig. 4—Headstock.

Fig. 5.—Mechanic's Lathe

light cuts, and so obtain results with which the owner of an elaborate instrument cannot at all compete. A modern mechanic's lathe on the other hand, such as fig. 5, has very different demands made upon it. For this the greatest possible steadiness in all the working parts is the main desideratum, and it is of great advantage to have the means of obtaining a slow speed, so as to be able to take the heaviest cuts which its strength and the power available warrant. Timber has accordingly given place either to cast iron or gun-metal or steel in almost every part of a

lathe of this class, the resulting increase of weight and firmness enabling the hand turner successfully to operate on small sizes of wrought iron or even steel, notwithstanding that in driving the fly-wheel his force can be applied only during a portion of each revolution.

In turning hard materials such as these it is of primary importance that the tool should be held more rigidly than it can with the hand when no support is available except that of a narrow T-headed rest. The difficulty of doing this was to some extent got over formerly by employing "heel tools," which transferred most of the strain directly to a flat-topped rest and made correspondingly reduced demands upon the arm of the turner; but it was never completely overcome till the introduction of the "slide-rest," placed the movement of the tool under complete control, and grasped it in a hand that never tires. Fig. 6 shows a

Fig. 6—Slide-Rest

slide-rest such as would be used with the lathe in the previous engraving, for which purpose simplicity of construction and steadiness in all its parts are the points chiefly aimed at. Slide-rests designed for amateurs' use are sometimes very different from this in respect of complication and the number of different movements of which they are capable, but each increase in the number of parts intervening between the lathe-bed and the tool is a source of possible unsteadiness which should not be introduced without reason.

Foremost amongst the more complicated lathes both in utility and in the date of their introduction stand "screw-cutting lathes," in which a regular spiral can be traced upon the work by self-acting means. The traversing mandrel, in which this end was formerly attained by giving a longitudinal motion to the mandrel and the work attached to it, and keeping the tool stationary, is now but little used, the modern plan of causing the slide-rest to travel along the bed automatically being more convenient in most instances. It involves, however, an amount of gearing almost inadmissible in a foot-lathe, and it is for those driven by steam-power that it is chiefly employed. These, being machine tools, do not come within our present subject. It should be mentioned that screws can be cut in foot-lathes by hand-chasing tools without any special arrangement, and they are done in this way to a great extent by telescope makers and others with beautiful regularity.

"Chucks"—a term which embraces most of the contrivances by which the turner establishes connexion between his work and the mandrel—have been made to contribute in various ways to the production of abnormal forms. The oval chuck is used (as its name implies) for giving an elliptical path to the work in lieu of a circular one. The eccentric chuck enables any point or any series of points in succession to be brought into a line with the axis of the mandrel. With the former chuck, therefore, a fixed tool can trace an ellipse on the face of the work, and with the latter a series of intersecting or adjacent circles can be described by it. In this way a great variety of intricate

"engine turned" patterns can be produced in the lathe, some idea of which may be gathered from the comparatively simple one shown in fig. 7. To the complicated apparatus known as the geometric chuck neither straight lines nor irregular curves are impossible. The "rose-engine" is a very old device for producing a somewhat similar kind of ornament, such as fig. 8, by giving a chattering motion to the mandrel, which is specially mounted on a vibrating frame for that purpose. The wavy lines on the backs of watches are engraved in this

FIG 7—An Engine-turned Pattern

FIG 8—Rose-engine Pattern

way, the curvature of the case not preventing the use of the rose-engine, as it would that of the eccentric chuck. But it is probable that these methods of producing face-work ornament will gradually disappear, and that all who still have leisure for doing them will prefer to use elliptic and eccentric and rose cutters fixed in the slide-rest and driven independently of the mandrel by overhead motion. With these similar results can be obtained, and the tool only instead of the entire mass of the work has to follow the desired curve.

Sketches of a few characteristic turning tools are given in fig. 9. A, a chisel, and B, a gouge, for soft wood, C, a heel tool for wrought iron, D, E, the enlarged ends of a pair of chasing tools for cutting outside and inside screw-threads, and F, G, two slide-rest tools. Of these last F is forged from a square bar of steel (an operation which must be repeated from time to time as

FIG 9—Turning Tools

the edge gets worn away), and G has an iron shank made once for all, from which the steel-cutting portion can be removed for the purpose of sharpening or renewal. The saving of tool-steel thus effected is of course no great consideration in the case of these small tools, but it is very considerable in the large axes used with the power lathes of the present day. Examples of these will be found under the heading MACHINE TOOLS (*q.v.*). (G. P. B. S.)

LATIMER, HUGH (c. 1490-1555), bishop of Worcester, and one of the chief promoters of the Reformation in England, was a native of Thracston, Leicestershire, and the son of a yeoman, who rented a farm "of three or four pounds by year at the uttermost." Of this farm he "filled as much as kept half a dozen men," retaining also grass for a hundred sheep and thirty cattle. The year of Latimer's birth is not definitely known. In the *Life* by Gilpin it is given as 1470, a palpable error, and possibly a misprint

for 1490.¹ Foxe states that at "the age of fourteen years he was sent to the university of Cambridge," and as he was elected fellow of Clare in 1509, his year of entrance was in all likelihood 1505. Latimer himself also, in mentioning his conversion from Romanism about 1523, says that it took place after he was thirty years of age. According to Foxe, Latimer went to school "at the age of four or thereabout." The purpose of his parents was to train him up "in the knowledge of all good literature," but his father "was as diligent to teach him to shoot as any other thing." As the yeomen of England were then in comparatively easy circumstances, the practice of sending their sons to the universities was quite usual, indeed Latimer mentions that in the reign of Edward VI., on account of the increase of rents, the universities had begun wonderfully to decay. He graduated B.A. in 1510, and M.A. in 1514. Before the latter date he had taken holy orders. While a student he was not unaccustomed "to make good cheer and be merry," but at the same time he was a punctilious observer of the minutest rites of his faith and "as obstinate a Papist as any in England." So keen was his opposition to the new learning that his oration on the occasion of taking his degree of bachelor of divinity was devoted to an attack on the opinions of Melancthon. It was this sermon that determined Bilney to go to Latimer's study, and ask him "for God's sake to hear his confession," the result being that "from that time forward he began to smell the word of God, and forsook the school doctors and such fooleries." Soon his discourses exercised a potent influence on learned and unlearned alike; and, although he restricted himself, as indeed was principally his custom through life, to the inculcation of practical righteousness, and the censure of clerical abuses, a rumour of his heretical tendencies reached the bishop of Ely, who resolved to become unexpectedly one of his audience. Latimer on seeing him enter the church boldly changed his theme to a portrayal of Christ as the pattern priest and bishop. The points of comparison were of course deeply distasteful to the prelate, who, though he professed his "obligations for the good admonition he had received," informed the preacher that he "smelt somewhat of the pan." Latimer was prohibited from preaching in the university or in any pulpits of the diocese, and on his occupying the pulpit of the Augustinian monastery, which enjoyed immunity from episcopal control, he was summoned to answer for his opinions before Wolsey, who, however, was so sensible of the value of such discourses that he gave him special licence to preach throughout England. At this time Protestant opinions were being disseminated in England chiefly by the surreptitious circulation of the works of Wickliffe, and especially of his translations of the New Testament. The newleaves had begun to communicate its subtle influence to the universities, but was working chiefly in secret and even to a great extent unconsciously to those affected by it, for many were in profound ignorance of the ultimate tendency of their own opinions. It was perhaps, as regards England, the most critical conjuncture in the history of the Reformation, both on this account and on account of the position in which Henry VIII. then stood related to it. In no small degree its ultimate fate seemed also to be placed in the hands of Latimer. In 1526 the imprudent zeal of Barnes had resulted in an ignominious recantation, and in 1527 Bilney, Latimer's

¹ The only reasons for assigning an earlier date are that he was commonly known as "Old Hugh Latimer," and that Berniet, his Swiss servant, states incidentally that he was "above threescore and seven years" in the reign of Edward VI. Bad health and anxieties probably made him look older than his years, but under Edward VI. his powers as an orator were in full vigour, and he was at his book table and summer at two o'clock in the morning.

most trusted confidant, incurred the displeasure of Walsay, and did humiliating penance for his offences. Latimer however, besides possessing far-seeing sagacity, quick insight into character, and a ready and formidable wit which thoroughly disconcerted and confounded his opponents, had naturally a distaste for mere theological discussion, and the truths he was in the habit of inculcating could scarcely be controverted, although, as he stated them, they were diametrically contradictory of prevailing errors both in doctrine and practice. In December 1529 he preached his two "Sermons on the Cards," which awakened a turbulent controversy in the university, and his opponents, finding that they were unable to cope with the dexterity and keenness of his satire, would undoubtedly have succeeded in getting him silenced by force, had it not been reported to the king that Latimer "favoured his cause," that is, the cause of the divorce. While, therefore, both parties were imperatively commanded to refrain from further dispute, Latimer was invited to preach before Henry in the Lent of 1530. The king was so pleased with the sermon that after it "he did most familiarly talk with him in a gallery." Of the special regard which Henry seemed to have conceived for him Latimer took advantage to pen the famous letter on the free circulation of the Scriptures, an address remarkable not only for what Mr Froude justly calls "its almost unexampled grandeur," but for its striking repudiation of the aid of temporal weapons to defend the faith, "for God," he says, "will not have it defended by man or man's power, but by his word only, by which he hath evermore defended it, and that by a way far above man's power and reason." Though the appeal was without effect on the immediate policy of Henry, he could not have been displeased with its tone, for shortly afterwards he appointed Latimer one of the royal chaplains. In times so "out of joint" Latimer soon became "weary of the court," and it was with a sense of relief that he accepted the living of West Kingston, Wiltshire, conferred on him by the king in 1531. Harassed by severe bodily ailments, encompassed by a raging tumult of religious conflict and persecution, and aware that the faint hopes of better times, which seemed to gild the horizon of the future, might be utterly darkened by a failure either in the constancy of his courage or in his discernment and discretion, he exerted his eloquence with unabating energy in the furtherance of the cause he had at heart. At last a sermon he was persuaded to preach in London exasperated Stokesley, bishop of the diocese, and seemed to furnish that fervent persecutor with an opportunity to overthrow the most dangerous champion of the new opinions. Bilney, of whom Latimer wrote, "if such as he shall die evil, what shall become of me!" perished at the stake in the autumn of 1531, and in January following Latimer was summoned to answer before the bishops in the consistory. After a tedious and captious examination, he was in March brought before convocation, and on refusing to subscribe certain articles was excommunicated and imprisoned, but through the interferences of the king he was finally released after he had voluntarily signified his acceptance of all the articles except two, and confessed that he had erred not only "in discretion but in doctrine." If in this confession he to some extent tampered with his conscience, there is every reason to believe that his culpable timidity was occasioned, not by personal fear, but by anxiety lest by his death he should hinder instead of promoting the cause of truth. After the consecration of Crammer in 1533 his position was completely altered. A commission appointed to inquire into the disturbances caused by his preaching in Bristol severely censured the conduct of his opponents; and, when the bishop prohibited him from preaching in his diocese, he obtained from Crammer a special licence to preach throughout the province of Canter-

bury. In 1534 Henry formally repudiated the authority of the pope, and from this time Latimer was the chief co-operator with Crammer and Cromwell in advising the king regarding the series of legislative measures which rendered that repudiation complete and irrevocable.

It was, however, the preaching of Latimer more than the edicts of Henry that established the principles of the Reformation in the minds and hearts of the people; and from his preaching the movement received its chief colour and complexion. The sermons of Latimer possess a combination of qualities which constitute them unique examples of that species of literature. It is possible to learn from them more regarding the social and political condition of the period than perhaps from any other source, for they abound, not only in exposures of religious abuses, and of the prevailing corruptions of society, but in references to many varieties of social injustice and unwisdom customs, in racy sketches of character, and in vivid pictures of special features of the time, occasionally illustrated by interesting incidents in his own life. The homely terseness of his style, his abounding humour, rough, cheery, and playful, but irresistible in its simplicity, and occasionally displaying sudden and dangerous barbs of satire, his avoidance of dogmatic subtleties and noble advocacy of practical righteousness, his bold and open denunciation of the oppression practised by the powerful, his soothing diatribes against ecclesiastical hypocrisy, the transparent honesty of his fervent zeal, tempered by sagacious moderation—these are the qualities which not only rendered his influence so paramount in his lifetime, but have transmitted his memory to posterity as perhaps that of the one among his contemporaries most worthy of our interest and admiration.

In September 1535 Latimer was consecrated bishop of Worcester. While holding this office he was selected to officiate as preacher when the friar Forest, whom he vainly endeavoured to move to submission, was burned at the stake for teaching treason to his penitents. In 1536, being opposed to the "Act of the Six Articles," Latimer resigned his bishopric, learning from Cromwell that this was the wish of the king. It would appear that on this point he was deceived, but as he now declined to accept the articles he was confined within the precincts of the palace of the bishop of Chichester. After the attainder of Cromwell little is known of him until 1546, when, on account of his connexion with the preacher Crome, he was summoned before the council at Greenwich, and committed to the Tower. Henry died before his final trial could take place, and the general pardon at the accession of Edward VI. procured him his liberty. He declined to resume his see, notwithstanding the special request of the Commons, but in January 1548 again began to preach, and with more effectiveness than ever, crowds thronging to listen to him both in London and in the country. Shortly after the accession of Mary in 1553 a summons was sent to Latimer to appear before the council at Westminster. Though he might have escaped by flight, and though he knew, as he quaintly remarked, that "Smithfield already groaned for him," he at once joyfully obeyed. The pursuivant, he said, was "a welcome messenger." The hardships of his imprisonment, and the long disputations at Oxford, told severely on his health, but he endured all with unbroken cheerfulness. On October 16, 1555, he and Ridley were led to the stake at Oxford. Never was man more free than Latimer from the taint of fanaticism or less dominated by "vainglory," but the motives which now inspired his courage not only placed him beyond the influence of fear, but enabled him to taste in dying an ineffable thrill of victorious achievement. Ridley he greeted with the words, "Be of good comfort, Master Ridley, and play the man; we shall this day light such a candle by God's grace in

The inscription is as follows —
 Jovis Sat dextro qui med matris, not ed endo comis virco ued,
 ased nois Op Totetia pasci vois.

Dreos med fced en manom enom dreosme med mao statod.

The general style of the writing and the phonetic peculiarities make it pretty certain that this work must have been produced not later than 800 A.D., the characters employed prove that the writer was familiar with one of the dialects spoken in the hilly country to the east of Rome, but on the whole the language may be taken as Latin. Some points in its interpretation are still open to doubt, but the probable interpretation is as follows:

Jovi Saturno civis qui (= ei) qua me mitet, ne te endo (= in te) comis virgo at, sed nra Op Totetia pasci vo.

Dreos me fecit in manum enim de nou me mano statod.

"If any one brings me to the gods Jupiter and Saturn, let not any maiden be kindly to thee, except unless thou wilt offer a sacrifice to Ops Tutela."

"Dreos made me for the offering to the dead, therefore on the ninth day place me for the offering for the dead."

The noteworthy phenomena here are the retention not only of *en* but of the much more archaic *on*, apparently taking the place of the former by a dialectic variation, *on* in *comis* for a short *en*; *et* for *e* in *fecit*, *e* before *o*, and *ed* apparently to represent the sound of *dy* (-y).

A bronze tablet recently discovered near the Fucine Lake, and some works of art found at Palestrina, belong to the same period. They are undoubtedly Latin, but the Latin has been mixed with other elements so that it would have been quite unintelligible to a native of Rome.

Of the earlier long inscriptions the most important would be the Columna Rostrata, or column of Duilius, erected to commemorate his victory over the Carthaginians in 260 B.C., but for the uncertainty as to the extent to which it has suffered from the hands of restorers. The shape of the letters plainly shows that the inscription, as we have it, was cut in the time of the empire. Hence Ritschl and Mommsen suppose that the language was modified at the same time, and that, although many archaisms have been retained, some were falsely introduced, and others replaced by more modern forms. The most noteworthy features in it are—C always for G (CÆSET = *gaeset*); D retained in the ablative (*e g*, in *alled marid*), *e* for *u* in inflections (*prinsus*, *exfocent* = *exquingent*), single for double consonants (*desert* = *desertus*), *e* for *i* (*involens* = *involens*, *secund* = *secundus*); of these the first is probably an affected archaism. G having been introduced some time before the assumed date of the inscription. On the other hand, we have *prædes* where we should have expected *prædes*; no final consonants are dropped; and the forms *de*, *es*, and *et* for the consecutive plural are unchanged exceptively. The doubts here arising preclude the possibility of using it with confidence as contemporary evidence for the state of the language.

Of unquestionable genuineness and the greatest value are the *Sarcophagi*, inscribed on stone coffins, found in the monument of the Scipios outside the Capene gate. The earliest of the family whose epitaph has been preserved is L. Cornelius Scipio Barbatus (consul 298 B.C.), the latest C. Cornelius Scipio Hispanus (praetor in 189 B.C.); but there are good reasons for believing with Ritschl that the epitaph of the first was not contemporary, but was somewhat later than that of the son (consul 269 B.C.). The last may therefore be taken as the earliest specimen of any length of Latin as it was written at Rome, it runs as follows—

honouco. plourime. coenobunt. i. comas
 dionoro. optime. fulis. ulro [vervum]
 ludom. seipione. i. barbatu
 coenol. noenno. adilla. hic. fust. a [pud eos]
 he jo. cept. coenno. aleraque. urbe in pugnamodo
 adidet. tempestatibus. aule. mereto [d. votum].

The archaisms in this inscription are—(1) the retention of *e* for *u* in the inflection of both nouns and verbs; (2) the diphthongs *oi* (= *ui*) and *ou* (= *ou*); (3) *et* for *et*, *he* for *hic*, and *obae* for *obae*; (4) the absence of double consonants, and (5) *duon* for *duo*. On the other hand, the dropping of a final *m* in every case except in *Lucum* is a sign of the tendency to lighten final syllables, which is a marked characteristic of the language of this period.

In the epitaph of Scipio Barbatus, a nowhere appears where the later language has *u*, except in the doubtful case of *Sannio* (= *Sannius*). The diphthongs *oi* and *ou*, as well as *et*, are found in the latest of all the Scipio inscriptions (*aid cur* = *aditus curia*), as well as in the *Epistola Cornelium ad Tullianum* (187 B.C.), and in a letter actually contemporary dated of L. Scipio *Horatius*, iii. 248 B.C.; but in a somewhat earlier epitaph to a Scipio (L. Cornelius Ch. F. Ch. n. Scipio) we have *actio*. Of *et* for *et* and the like there are other examples in *dedi* (C. I. R., 69), comp. *dedi* in C. I. R., 82; *novobus* (= *duo*) of the Duilian column.

¹ Comp. Jordan in *Herms*, xvi. 225-60; Bucheler in *Zeitsch. Mus.*, xxxv. 285 sq.

Double consonants first appear in the decree of *Manlius*, though not regularly (comp. *procedunt* by *essent* and *procedere*); in the *Epist. ad Tull.* they are still not used. *Thonus* is not found elsewhere, except in the *Carmen Salutare*, but *Duolonus* for *Tholonus* appears in the *Epist. ad Tull.*; and *duolonus* for *bellum* occurs in *Ennius* and *Plautus*, as a legal archaism in *Cicero*, and as a poetic variation in *Horace*, *Ornd*, and *Jermal*.

A number of precious indications of archaisms on the one hand and mutilated forms on the other are supplied by deducatory tablets of about the same age found in Picenum and Latium. As specimens of the former we may select *Maurie* = *Mauri*, *præidæ* = *præidæ*, *Janus* = *Janus*; of the latter, *deduct* or *deict* or *deict*, *delerat*, *dedat*, *dedat*, *capu* = *caput*; the omission of a final *n* is also common.

It was a turning point in the history of the Latin language when Roman literature took its rise under the influence of the Greek culture. It is a reasonable conjecture that the much greater corruption of the Umbrian dialect as compared with the Latin, and of the Latin as compared with the Oscan, in regard to the precise representation of sound, was due mainly to the varying degrees of contact with Greek civilization. The inscriptions dating from the fifth century of the city show the greatest archaism in such points as the insertion or omission of final *s* and *m*, and of *e* before *s*, and in the distinction of *e* and *u*, and *a*. The language of *Plautus* shows us the struggle of the two tendencies in the plainest manner. On the one hand we have numerous archaisms not only in form but in quantity. Of the old long vowels in final syllables we have the following still retained, not indeed always, but when it is convenient for the verse—

- a* in the nom. and voc. of the first declension:
ne epistula quoniam illa at in ætibus (*Adm.*, 762)
-bae in dat. and abl. plur. [usually where a pause in the sense affords some justification]:
ut ego illic coelis exuriam flammulis ardentes (*Afen.*, 842)
-e in nom. of substantives, and comparatives, and also in verb-nom. quoniam *deus in fingebat, dūm non vixit ram* (*Adm.*, 927)
tantū mī sēgratūo auctū est in animo (*Isoclast.*, 782)
pōi qū quidem expirite ite ut prædes, Prædesio (*Adm.*, 638).
-i in nom. of substantives, and comparatives, and also in verb-nom. *maus fuit pater Antimachus, ego vero Lyconides* (*Adm.*, 772)
-u, not only in the subj. (where it is a contraction for *-ū*) and in the perf. ind., but even in the present:
pōtione aliquid, prius quam pēcipit insana (*Mem.*, 921)

quod quique in animo habet aut habuit, eant (*Trin.*, 806).
 [Ritschl, "in animo habet"]

fundum alium arit, inouum familiarem dēcent (*Ann.*, 874)

On the other hand we have much more commonly traces of the destructive influence which was beginning to affect the tenso powerfully the form of Latin words, especially in their final syllables. From causes which it is now impossible to discover, the freer acoustication of earlier times, the existence of which was proved incidentally by Verner in his famous paper on some exceptions to the law of "Lautverschiebung" (*Kuhn's Zeitschrift*, xxiii. 97-138), had been given up in favour of a more rigid system, which never allowed the accent to fall on the final syllable. Hence there was a constant struggle between the desire to preserve the older quantity of the final vowel and the tendency to shorten an unaccented syllable. This difficulty of preserving the quantity of the final vowel is naturally greatest when the accented syllable is short; hence we are led to the formula that for *Plautus*, and therefore for the spoken language of his time—

This holds good for all vowels, whether in nouns or in verbs, e.g.:
a: *actus* si futurum; *rogū* me viginti minas (*Pœt.*, 114).
e: *carū* præteritis illas ædis quin rogo (*Æpid.*, 438)
i: *ment* bellatoris signum; *quis* hic præsentia sicut (*Mit.*, 1077).
o: *nostrū* libertis quos dēt quod pæpēt. dicitur, præbebo cibum (*Æpid.*, 737).
u: *quod* mandū nequeunt tūgere, tantum illi habent, quō minas appetunt (*Trin.*, 288).

The last case is a rare one; the others are very common.

But further, forms like those quoted above from the inscriptions, *e.g.*, *dedro, oino, cuba*, &c., led Ritschl and his followers to the recognition of the fact that even at this early time there was a strong tendency to drop the final consonant in Latin, and this at once furnished a clue to the proper interpretation of many metrical phenomena in Plautus, which had previously been explained on wholly incorrect assumptions.

In the case of a line like *Trin*, 306,

nô libi segredimâm pater pateram, parsi sêdulo,

it was assumed that *pater* was pronounced like *pâre*, in order to avoid the apparent neglect of the law of position, which would, according to the practice of the classical poets, have lengthened the syllable *ter*. Two considerations suffice to dispose of this hypothesis:—first, there is no evidence whatever that a mute between two vowels was ever dropped in early Latin, secondly, if *pater* became by "compression" *pâre*, it would be natural to find *inter* becoming *ivare*; but in no case does a form with the first syllable long and the second lengthened by position take the place of one long syllable. On the other hand, there is positive evidence of a varied and unquestionable character to show that a final consonant was frequently dropped in pronunciation, especially in an iambic word. Hence it is clear that *pater* was pronounced *pâtr*, not *pâre*. This shows too that it was not the case, as has been asserted, that a final *r* was dropped only when it took the place of an earlier *r*, although this is doubtless the most common instance of its omission. The consonants most commonly dropped are the following:—
1. *g*, *g*, *num*(i) *lêpide fecit verba ad paramoniam* (*Aul*, 468). This licence is retained by Ennius (*g.g.*, *Aen*, 601, *tum laterale*) *dolor, caritumina*(s) *nuntia*(s) *mora*(s), and is common even in Lucretius. Cicero (*Orat*, 48, 161) speaks as if it had been the usual pronunciation in his own earlier days, and he admits it seven or eight times in his version of Aratus, *e.g.*, *magna*(s) *Leo*, &c.
2. *m*, *e.g.*, *dâm quid(m)* *ne qui pœrœtoris quod m* *head* *habet* *proloqui*.

The practice of eliding a syllable ending in *m* before a following vowel shows how lightly this consonant was pronounced even by the classical poets. It is very frequently omitted in inscriptions of every period (comp. Corssen, l. 287-74). As Quinctilian (*ix*, 4, 40) says, "in parum exprimitur" *necne enim eximetur, sed excutitur*." In this respect Umbrian quite agreed with popular Latin, but Oscan and Volscian carefully preserved the *m* (Corssen, l. 276).
3. *t*, *e.g.*, *set arroboi dedit*(i) *quadragesimâ minas* (*Alost*, 648).
So in inscriptions *dê* (*O I L*, i. 5218).
4. *l*, *e.g.*, *lucipid*(s) *Cos magna labe magna famulast* (*Aul*, 340).
r—*as above*, or, *e.g.*, *pater vixit* and *quid pœrtum autem*, *bêlus* (*Ter*, *Phorm*, 601).

5. *s*, *e.g.*, *et stum*(i) *conficiam ficihus ego quod volo* (*Ter*, *Heaut*, 808).
6. *s*, *e.g.*, *ad quid istuo est quod vos agitis? nōn hœst tane(m)* *sêpior* (*Ter*, *Eur*, 874).

It is doubtful whether the last two licences occur in Plautus. Occasionally we find these two tendencies concurring, and producing a short final syllable by the loss of a final consonant and the shortening of a vowel naturally long under the influence of the accent, so that we have forms like *oes*, *iose*, *uies*, *reios*, *maeu*, scanned as two short syllables, not only (a) before vowels, but (b) even before consonants, *e.g.*—

(a) *œni* *mordicus me aduident, bœvœ moursent cœribus* (*Aul*, 293).

(b) *lêpis fore iumbus quo sub tœre arguist modo* (*Aul*, 690)
vêre *noctre quibus tibi nos voluist esse matre famulus* (*Aul*, 98).

Ad pupillas famile ferat, labris & labris insequam afferrat (*Stach*, 480).

The tendency to drop the final consonant of an iambic word is further extended to groups of words of the same scansion, especially when the second is a preposition, as in

quis id fore est? &c. (*Amphitr*, 1014)
Opte id, quod sit contigit tibi vis (*Aen*, 718).

Accent had also an important effect in inducing the voice to hurry over unaccented syllables, even though long by position, in order to lay full stress upon an accented syllable. But this naturally took place only when the syllable thus shortened was itself preceded by a short syllable so that the formula for this process is *-4=* *u u . .*. Under this head we may bring a large number of instances of apparent neglect of quantity. Many of these are cases where the usual spelling is with a double consonant. Some have argued that as doubled consonants were not used in writing before the time of Ennius (*Fest*, s. v.

"*Solitaria*," p. 293, confirmed from inscriptions by Ritschl, *P. L. M. S.*, p. 123), this is an indication that the pronunciation fluctuated, but it is doubtful whether this was ever the case except under the influence of the accent; and this influence was quite as powerful over syllables followed by two different consonants as by a doubled consonant.

Thus, *pei* *innōnem caram dixit me natum pater* (*Stach*, 179)

does not differ in principle from

qua omnia bonas bondaque adcurare dâdœet (*Trin*, 78);

and the unusual quantity of the last two words in *nô potius oneratus noemet vicissim volupstatibus* (*Stich*, 532) is to be explained in precisely the same way, except that in the latter the voice is hurrying on to dwell upon a long accented syllable, in the former the accent has already fallen on a short accented syllable, a fact which naturally tends to elaten the following unaccented one. Compare for this

configo aquilas fides thesaurizans (*Aul*, 395)

where Goetz after Fleckenstein reads "agius" =

The combinations before which position is most commonly neglected are the following:—

ut *si id mea voluntate factum* (*Trin*, 1186).

pe *voluptatē inens tantum* (*Rud*, 459).

et *negligit*, *si que me hanc labore vident* (*Rud*, 477).

rem *claudem in capiti dormio blandam in tabernaculo* (*Trin*, 728).

ps *scio* *lêpide dictum hoc defensores dicere* (*Capt*, 69).

eg *sed* *ans ingento frustra es* . . . (*Pseud*, 378).

It is needless to dwell further upon the details of Platine scansion. The foregoing instances will have made it clear that, while there are some archaisms still retained, on the whole the language was beginning to suffer from that process of disintegration, which has left such marked traces upon almost every modern language.

The introduction of Greek metres for the drama doubtless did much to check this process, and it is probable that, even in the earliest Roman comedies, licences of pronunciation are much less common than they were in the popular language of the time. But the iambic and trochaic measures, especially as employed by the Roman poets, admitted of a free treatment, which left room for much laxity. It was not until the hexameter came to be used for poetry that the laws of prosody were definitely fixed. The rigid canon of dactylic verse required that the pronunciation should be strictly determined; and hence Ennius, although he does not appear to have introduced any marked changes in generally recognized rules of quantity, was compelled to settle positively much which had previously been fluctuating, and so to lay down the line to which subsequent poetical works had to conform. From this time forward the literary language of Rome parted company from the popular dialect. It has been said with truth that even to the classical writers Latin was in a certain sense a dead language. Its vocabulary was not identical with that of ordinary life. Literary works, whether in prose or in verse, had to conform to a fixed standard. Now and again a writer of fresh originality would lend new vigour to his style by phrases and constructions drawn from homely speech. But on the whole, and in ever increasing measure, the language of literature was the language of the schools, adapted to foreign models. The genuine current of Italian speech is lost to view with Plautus and Terence, and reappears only in the semi-barbarous products of the early Roman literature.

This appears the proper place for a rapid survey of the Pronunciation of the Latin language, as spoken in its best classical days.

CONSONANTS.—1. *Capitalis* (a) Sonant G, pronounced as in English, but never softened before about the 6th century after Christ. (b) Sonant G, pronounced always as *g* (except that in some early

¹ The evidence for this pronunciation of *s* will be found best stated in Corssen, l. 43-67, and Roby, l. xlvii-lv. It may be summed up as follows:—(1) In some words the letter following *s* varies in a

inscriptions the character is used for G) until about the 7th century after Christ. K went out of use at an early period, except in a few old abbreviations for words in which it had stood before a, e.g. *kal* for *kalendis*. Q always followed by the consonantal s, except in a few old inscriptions, in which it is followed by the vowel u, e.g. *sequens*. X, an abbreviation for ex, es u, however, sometimes found. (c) Aspirate H, the rough breathing as in English.

3. *Palatal*. The spirit J, like the English y, is only in late inscriptions that we find, in spellings like *Zanavus*, *Olene*, any indication of a pronunciation like the English.

4. *Language*. (a) R as in English, but probably produced more with the point of the tongue. (b) L as in English. (c) S, always euri when initial, but at one time sonant between vowels, and possibly when final. (d) Z only found in the transcription of Greek words in and after the time of Cicero.

5. *Dental*. (a) Sonant, D as in English, but by the end of the 4th century d before a vowel was pronounced like our f (comp. *diurnal* and *journal*). (b) Surd, T as in English. (c) Nasal, N as in English, but also (like the English n) a guttural nasal (ng) before a guttural. Apparently it was very lightly pronounced, and easily fell away before s.

6. *Labial*. (a) Sonant, B as in English, but occasionally in inscriptions of the later empire it is written for b, showing that in some cases b had already acquired the soft sound of the contemporary P. B before a sharp s was pronounced p, e.g., in *uris*. (b) Surd, P as in English. (c) Nasal, M as in English, but very slightly pronounced at the end of a word. (d) Spirit, V like the own Fr. ou, but probably often approximating to the South German w, e.g., a labial, not (like the English v) a labio-dental v.

7. *Labio-dental*. Spirit, F as in English.

II. *Vowels*. — a, e, i, as the English a, oo, ee; o, u, a sound coming nearer to our than the English o; e, an open Italian e, nearly as the vowel of *pet* in English. The short sound of each vowel was probably identical in quality with the long sound, differing only in quantity. Hence a was pronounced as in the French *chaix*, e nearly as in *petit*, i nearly as in *pit*, o as in *dot*, u nearly as in *put*. The diphthongs were produced by pronouncing the vowels of which they were composed very rapidly according to the above scheme. Thus *ae* — somewhat broader than *oe* in *house*, *ai* like *oi* in the Yankee pronunciation of *town*, as like the vowel in *had* lengthened, with perhaps somewhat more approximation to the *i* in *view*; *oe*, a sound intermediate between o and e; *ou*, nearly as in *found*, with the greater stress on the o; *ui*, as the French *oui*.

The changes which may be detected in the Latin language during the period of its literary development may be arranged under the heads of (1) vocabulary, (2) inflexion, (3) word formation, (4) syntax.

These will be best regarded separately in connexion with the four principal stages in the history of the language, which may be given, with their chief writers, as follows: — I. *Ante-Classical* (240–80 B.C.) — Nævius (189–204), Plautus (204–184), Ennius (189–169), Cato (234–149), Terentius (119–159), Pœtius (220–132), Accius (170–84), Lucilius (118–108).

II. *Classical—Golden Age* (80 B.C.–14 A.D.) — Varro (116–28), Cicero (106–44), Lucretius (99–55), Cæsar (100–44), Octavian (87–47), Sallust (86–34), Virgil (70–19), Horace (65–8), Propertius (180–?), Tibullus (14–18), Ovid (43 B.C.–18 A.D.), Livy (59 B.C.–18 A.D.).

III. *Classical—Silver Age* (14–180 A.D.) — Valerius (119 A.D.–131 A.D.), M. Seneca (died c. 30 A.D.), Persius (84–82), Petronius (died 65), Lucan (39–65), L. Seneca (died 65 A.D.), Plinius major (23–79 A.D.), Martial (40–101), Quintilian (42–118), Plinius minor (61–113), Tacitus (16–101), Juvenal (147–138), Suetonius (75–180), Fronto (c. 90–170).

IV. *Post-Classical*.

number which makes it impossible to believe that the pronunciation of the o depended upon this, e.g., *decimus* and *decimæ*, *capit* and *capitæ*; (2) if o was pronounced before e and s otherwise than before a, o, and u, it is hard to see why it should not have been retained for the latter use; (3) as the writer gives every hint of a varying pronunciation of e; (4) a Greek e is always transcribed by e, i, and e; (5) Latin words containing a borrowed or Gothic and early High German are always spelt with æ. To these arguments it may be added that the varying pronunciations of oe, oi in the Romance languages are inseparable except as derived independently from an original *ae*, *ai*.

The additions made to the vocabulary of the Latin Greek language from the Greek belong to four different stages (Corssen, i. 814). The first corresponds to the period of the early intercourse of Rome with the Greek states, especially with the colonies in the south of Italy and Sicily. To this stage belong many names of nations, countries, and towns, as *Siculi*, *Tarentum*, *Græci*, *Acher*, *Karthago*, *Pœnus*; and also names of weights and measures, articles of industry, and terms connected with navigation, as *drachma*, *mana*, *talentum*, *purpura*, *machina*, *patina*, *ancora*, *aplustre*, *navis*. To these may be added names of gods or heroes, like *Apollō*, *Pollux*, and perhaps *Hercules*. These were all freely adapted to the phonetic laws of the Latin language.

A second stage is marked by the closer intercourse resulting from the conquest of southern Italy, and the wars in Sicily, and by the contemporary introduction of imitations of Greek literature into Rome, with its numerous references to Greek life and culture. In this stage, also, Greek words were freely adapted to the forms familiar to Roman ears: we find words like *penulus*, *scutula*, *amurex*, *jugum*, *balineum*, *bucana*, *techina*, *conscium*, *canistrum*, *carcer*, *sona* (*quint*), *tarpessita*, &c. In many cases hybrid forms are freely employed, whether by the addition of Latin suffixes to Greek stems as *ballistarius*, *hepatarius*, *subatellus*, *acus*, *epiphantiorus*, or of Greek suffixes to Latin stems as *piagipatadas*, *peronoides*; or by derivation, as *temopolare*, *supplantans*; or by composition as *meueneche*, *thyrisgera*, *flagitribus*, *seropipacai*. The character of many of these words shows that the comic poets who indulged in them must have been able to calculate upon a fair knowledge of colloquial Greek on the part of a considerable portion of their audience. The most remarkable instance of this is supplied by the burlesque lines in Plautus (*Pœt.*, 702 *sg.*), where Sgaristio describes himself as

Vanilequodens, Virgineuendens,
Nugipalantiquodens, Argentumextrobrovendes,
Tediuguloquodens, Nummosexalpondens,
Quodsemelcapitales, Nunquampostroquodens.

During this period Greek words are generally inflected according to the Latin usage.

But with Accius begins a third stage, in which the Greek inflexion is frequently preserved, e.g., *Hectora*, *Orestes*, *Citlaeron*; and from this time forward the practice wavers. Cicero generally prefers the Latin case-endings, defending, e.g., *Paræum* as against *Piræes* (*Ad Att.*, vii. 3, 7), but not without some fluctuation, while Varro takes the opposite side, and prefers *pœmatia* to the Ciceronian *pœmata*. By this time also y and s were introduced, and words newly borrowed from the Greek were faithfully reproduced.

A fourth stage is marked by the practice of the Augustan poets, who, especially when writing in imitation of Greek originals, freely use the Greek inflexions, such as *Aræides*, *Talys*, *Agida*, *Echda*, &c. Horace probably always used the Greek form in his *Odes*, the Latin in his *Satires* and *Epistles*. Later prose writers for the most part followed the example thus set.

In Plautus we have the best example of the vigorous Italian idiom, enriched, but in no way fettered by grace of imitation of the Greek. His constructions are sometimes free, and do not square with the canons of later grammarians; but there is much life and freshness, and it is very rarely that the right phrase is lacking to set forth his meaning with telling vigor.

The chief peculiarities of his grammar are:—

1. The use of some substantives with a gender different from that afterwards usual, e.g., *dormus*, *colinus*, *scævus*.
2. The retention of inflexions afterwards obsolete or retained only in exalted phrases: æ in the subj. pres., *dicent*, *crederetis*, *poteris*, *desperetis*. With regard to some of these archaic inflexions it is still a question how far they may be safely restored to the text of

Plautus, e.g., *homonem, cabi, cande, &c.*, the ablative *d*, nom. plur. in *-es, -as, -udis*, &c.

3. The use of words excluded from the language of classical literature, but reappearing in the popular dialect e.g., *supplicatio, ira, letuere, elapere, bellus, existerere, cancellare, nautica, savius, &c.* Under this head we may place the very frequent employment of diminutives, e.g., *pugilatum, herculidulum, appressumale, &c.*, especially as terms of endearment, "marum concubum, meliculum, veruculum," "passerculum, lacedilum, melilum, aniculum, monerulum, catellum, pulellum, &c." the use of *con, ad, &c.* de as strengthening particles, and of abstract nouns, especially in the plural, —all marks of the *plebeius sermo*.

4. Syntactical constructions afterwards unusual. e.g., the accusative after verbs like *fugere* and *videre*, the accusative of the object after the gerundive (*aptandum est videri*), the infinitive in indirect questions and with *cum* signifying "since" or "although"; present infinitive instead of future after verbs of promising; *quis* after verbs of feeling, instead of *quid, quoniam* = "since," "after"; infinitive with purpose of motion, *concedo* and *condono* with double accusative; *decuris, equis, &c.* and *exere* with ablative; *veror* with genitive; *similis* with genitive, *quid hoc est hominis*; *facere tuum, compendi*; *face* with a future logically dependent, the frequent use of *Apuro* synonymously, *adus ut, prapram, present*. There is a free use of verbs in the *2d*: *quid tibi hanc curvata est rem aut multatio*. By a laxity common in popular language verbs of seeing, knowing, asking, &c., are followed by a direct, not an indirect, question *scis ego, quis reddidisti?* *Agratulus* is very frequently employed to give life and rapidity to the style. e.g. (*Pseud.*, 168), *legido vobis, vno, unigenito, videri potius pulcherrimo*.

Nervius. In Nervius we find archaisms proportionally much more numerous than in Plautus, especially in the retention of the original length of vowels, and early forms of inflexion, such as the genitive in *-ae*, and the ablative in *-d*; shortenings do not seem so numerous. The number of archaic words preserved is perhaps due to the fact that so large a proportion of his fragments have been preserved only by the grammarians, who cited them for the express purpose of explaining these. The language of Ennius deserves especial study because of the immense influence which he exerted in fixing the literary style. He first established the rule that in hexameter verse all vowels followed by two consonants (except in the case of a mute and a liquid) or a double consonant, must be treated as lengthened by position. The number of varying quantities is also much diminished, and the elision of final *m* becomes the rule, though not without exceptions. On the other hand he very commonly retains the original length of verbal terminations (*ponit, eist, facit*) and of nominatives in *-or* and *-a*, and elides final *s* before an initial consonant. In declension he never uses *-ae* as the genitive, but *-ai* or *-as*; he has an inflexion *Meoos Paphlago*, probably intended for a dative; the shorter form of the gen. plur. is *-um* in common; obsolete forms of pronouns are used, as *me, olit, sum* (= *eam*), *sis, nos, apes*; and in verbal inflexion there are irregularities like *moritur, furimus, potestur, contidit, &c.* Some experiments in the way of trochees (*saxo cere cominit -brum*) and apocope (*divum domus altissum cael*, replet te lastifium gaz) were happily regarded as failures, and never took root in the language. His syntax is simple and straightforward, with the occasional pleonasm of a rude style, and conjunctions are comparatively rare.

Pacuvius. Pacuvius is noteworthy especially for his attempt to introduce a free use of compounds after the fashion of the Greek, which were felt in the classical times to be unsuited to the genius of the Latin language. Quintilian censures severely his line—
Nere repanditrem meumvevricum pecus
Acuvius. Acuvius, though probably the greatest of the Roman tragedians, is only preserved in comparatively unimportant fragments. We know that he paid much attention to grammar and orthography; and his language is much more finished than that of Ennius. It shows no marked archaisms of form, unless the infinitive in *-ier* is to be accounted as such. Lucilius furnishes a specimen of the language of the

period, free from the restraints of tragic diction and the imitation of Greek originals. Unfortunately the greater part of his fragments are preserved only by a grammarian whose text is exceptionally corrupt, but they leave no doubt as to the justice of the criticism passed by Horace on his careless and "muddy" diction. The *urbanitas* which is with one accord conceded to him by ancient critics seems to indicate that his style was regarded as free from the taint of provincial Latinity, and it may be regarded as reproducing the language of the educated circles in ordinary life; even the numerous Greekisms and Greek quotations with which it abounds show the familiarity of his readers with the Greek language and literature. Varro ascribes to him the *gracile genus dicendi*, the distinguishing feature of which were *venustus* and *subrilis*. Hence it appears that his numerous archaisms were regarded as in no way inconsistent with grace and precision of diction. But it may be remembered that Varro was himself something of an archaizer, and also that the grammarians' quotations may bring this aspect of his language too much into prominence. It is to be feared that the disgusting coarseness of many of his lines did not lose them favour with the circle for whom he wrote. He shares with the comic poets the use of many plebeian expressions, the love for diminutives, abstract terms, and words of abuse; but occasionally he borrows from the more elevated style of Ennius forms like *simus* (= *simul*), *novus* (= *non*), *facul* (= *facile*), and the genitive in *-as*, and he ridicules the contemporary tragedians for their *setematis*, their high-flown diction and *aequipedalis verba*, which make the characters talk "not like men but like portents, flying winged snakes." In his ninth book he discusses questions of grammar, and gives some interesting facts as to the tendencies of the language. For instance, when he ridicules a *praetor urbanus* for calling himself *praetor*, we see already the beginning of the confusion of *ae* and *e*, which afterwards became universal. He shows a great command of technical language, and (partly owing to the nature of the fragments) *ἀρχαῖ λέγόμενα* are very numerous.

The treatise of Cato *De Re Rustica* would have afforded Cato invaluable material, but it has unfortunately come down to us in a text greatly modernized. As it is, it is of interest from the point of view of literature rather than of language. We find in it instances of the accusative with *ut*, of the old imperative *praeferamino*, and of the fut. subj. *servasis, prohibeas*; but there is nothing which can be added to what we learn from Plautus.

It is unfortunately impossible to trace the growth of Latin prose diction through its several stages with the same clearness as in the case of poetry. The fragments of the earlier Latin prose writers are too scanty for us to be able to say with certainty when and how a formed prose style was created. But the impulse to it was undoubtedly given in the habitual practice of oratory. The earliest orators, like Cato, were distinguished for strong common sense, biting wit, and vigorous language, rather than for any grace of style; and probably personal *auctoritas* was of far more account than rhetoric both in the law courts and in the assemblies of the people. The first public speaker, according to Cicero, who aimed at a polished style, and elaborate periods, was M. Aemilius Lepidus Porcino, in the middle of the 2d century B.C.¹ On his model the Gracchi and Cato fashioned themselves, and if we may judge from the fragments of the orations of C. Gracchus which are preserved, there were few traces of archaism remaining. A more perfect example of the *urbanitas* at which good speakers aimed was supplied by a famous

¹ Cicero also refers to certain *scriptis distichis* of the son of Scipio Africanus Major, which must have possessed some merits of style.

Lucilius furnishes a specimen of the language of the

speech of C. Fannius against C. Gracchus, which Cicero considered the best of all orations of the time. No small part of the *urbanitas* consisted in a pronunciation equally removed from boorish roughness and from foreign affectations; and the standard of this was found in the language of the women of the upper classes, such as Lælia and Cornelia.

In the earliest continuous prose work which remains to us, the four books *De Rhetorica ad Herennium*, we find the language already almost indistinguishable from that of Cicero. There has been much discussion as to the authorship of this work, now commonly, without very convincing reasons, ascribed to Q. Cornificius; but, among the numerous arguments which prove that it cannot have been the work of Cicero, none has been adduced of any importance drawn from the character of the language. It is worth while noticing that not only is the style in itself perfectly finished, but the treatment of the subject of style, *elocutio* (iv. 12, 17), shows the pains which had already been given to the question. The writer lays down three chief requisites—(1) *elegantia*, (2) *compositio*, and (3) *dignitas*. Under the first come *Latinities*, a due avoidance of solecisms and barbarisms, and *explanatio*, clearness, the employment of familiar and appropriate expressions. The second demands a proper arrangement, free from hiatus, alliteration, rhyme, the repetition or displacement of words, and too long sentences. Dignity depends upon the selection of language and of sentiments.

Clarity-
tenacious
of Latin
prose

Hence we see that by the time of Cicero Latin prose was fully developed. We may, therefore, pause here to notice the characteristic qualities of the language at its most perfect stage. The Latin critics were themselves fully conscious of the broad distinction in character between their own language and the Greek. Seneca dwells upon the stately and dignified movement of the Latin period, and uses for Cicero the happy epithet of *gradarius*. He allows to the Greeks *gratia*, but claims *potestas* for his own countrymen. Quintilian (xii. 10, 27 *sq.*) concedes to Greek more euphony and variety both of vocalization and of accent; he admits that Latin words are harsher in sound, and often less happily adapted to the expression of varying shades of meaning. But he too claims "power" as the distinguishing mark of his own language. Feeble thought may be carried off by the exquisite harmony and subleness of Greek diction; his countrymen must aim at fulness and weight of ideas if they are not to be beaten off the field. The Greek authors are like lightly moving skiffs; the Romans spread wider sails and are wafted by stronger breezes, hence the deeper waters suit them. It is not that the Latin language fails to respond to the calls that are made upon it. Lucretius and Cicero concur, it is true, in complaints of the poverty of their native language, but this was only because they had had no predecessors in the task of adapting it to philosophic utterance; and the long life of Latin technical terms like *qualitas*, *species*, *genus*, *ratio*, shows how well the need was met when it arose. Mr Munro has said admirably of this very period—

"The living Latin for all the higher forms of composition, both prose and verse, was a far nobler language than the living Greek. During the long period of Grecian pre-eminence and literary glory, from Homer to Demosthenes, all the manifold forms of poetry and prose which were invented came after the others were brought to such exquisite perfection that their beauty of form and grace of language were never afterwards rivalled by Latin or any other people. But hardly had Demosthenes and Aristotle ceased to live when that Attic which had been gradually formed into such a noble instrument of thought in the hands of Aristophanes, Euripides, Plato, and the orators, and had expressed for general use all the other dialects, became at the same time the language of the civilized world and was stricken with a mortal decay. . . . Epicurus, who was born in the same year as Menander, writes a harsh jargon that does not deserve to be called a style; and others of whose writings anything is left entire or in fragments, historians and

philosophers alike, Polybius, Chrysippus, Philodemus, are little if any better. When Cicero deigns to translate any of their sentences, we wist grace and life he infuses into their dimly expressed thoughts, how satisfying to the ear and taste are the periods of Livy when he is putting into Latin the heavy and uncouth clauses of Polybius! This may explain what Cicero means when at one time he gives to Greek the preference over Latin, at another to Latin over Greek, in reading Sophocles or Plato he could acknowledge their unrivalled excellence, in translating Themistius or Philodemus he would feel his own immeasurable superiority."

The greater number of long syllables, combined with the paucity of diphthongs and the consequent monotony of vocalization, and the uniformity of the accent, lent a weight and dignity of movement to the language which well suited the national *gravitas*. The precision of grammatical rules and the entire absence of dialectic forms from the written literature contributed to maintain the character of unity which marked the Roman republic as compared with the multiplicity of Greek states. It was remarked by Bacon that artistic and imaginative nations indulge freely in verbal compounds, practical nations in simple concrete terms. In this respect, too, Latin contrasts with Greek. The attempts made by some of the earlier poets to indulge in novel compounds was felt to be out of harmony with the genius of the language. Composition, though necessarily employed, was kept within narrow limits, and the words thus produced have a sharply defined meaning, wholly unlike the poetical vagueness of some of the Greek compounds. The vocabulary of the language, though receiving accessions from time to time in accordance with practical needs, was rarely enriched by the products of a spontaneous creativeness. In literature the taste of the educated town circles gave the law; and these, trained in the study of the Greek masters of style, required something which should reproduce for them the harmony of the Greek period. Happily the orators who gave form to the Latin prose were able to meet the demand without departing from the spirit of their own language, and the periods of Cicero and Livy, though very different in structure from those of Plato and Demosthenes, are not less satisfying to the ear, or less adequate to the full expression of thought. To Cicero especially the Romans owed the realization of what was possible to their language and in the way of artistic finish of style. He represents a protest at one and the same time against the imbroils of the *plebeus sermo*, vulgarized by the constant influx of non-Italian provincials into Rome, and the "jargon of spurious and partial culture" in vogue among the Roman pupils of the Asiatic rhetoricians. His essential service was to have caught the tone and style of the true Roman *urbanitas*, and to have fixed it in extensive and widely read speeches and treatises as the final model of classical prose. The influence of Cæsar was wholly in the same direction. His cardinal principle was that every new-fangled and affected expression, from whatever quarter it might come, should be avoided by the writer, as rocks by the mariner. His own style for straightforward simplicity and purity has never been surpassed, and it is not without full reason that Cicero and Cæsar are regarded as the models of classical prose. But, while they fixed the type of the best Latin, they did not and could not alter its essential character. In subtlety, in suggestiveness, in many-sided grace and versatility, it remained far inferior to the Greek. But for dignity and force, for cadence and rhythm, for clearness and precision, the best Latin prose remains unrivalled. These qualities make it pre-eminently the language of legislation and of commerce. There is no business about a Latin sentence, directness, concreteness, and lucidity stamp it as the utterance of men who knew precisely what they wished to say, and said it with all the force at their command.

It is needless to dwell upon the grammar or vocabulary of Cicero. His language is universally taken as the normal type of Latin, and, as hitherto the history of the language has been traced by marking differences from his usage, so the same method may be followed for what remains.

Varro. M. Terentius Varro, "the most learned of the ancients," a friend and contemporary of Cicero, seems to have rejected the periodic rhythmical style of Cicero, and to have fallen back upon a more archaic structure. Mommsen says of one passage "the clauses of the sentence are arranged on the thread of the relative like thrushes on a string." But, in spite (some would say, because) of his old-fashioned tendencies, his language shows great vigour and spirit. In his Menippean satires he intentionally made free use of plebeian expressions, while rising at times to a real grace and showing often fresh humour. His treatise *De Re Rustica*, in the form of a dialogue, is the most agreeable of his works, and where the nature of his subject allows it there is much vivacity and dramatic picturesqueness, although the precepts are necessarily given in a terse and abrupt form. His sentences are as a rule co-ordinated, with but few connecting links; his diction contains many antiquated or unique words.

Salust. In Salust, a younger contemporary of Cicero, we have the earliest complete specimen of historical narrative. It is probably due to his subject-matter, at least in part, that his style is marked by frequent archaisms; but something must be ascribed to intentional imitation of the earlier chroniclers, which led him to be called "præcorum Catonisque verborum insatitissimus fur." His archaisms consist partly of words and phrases used in a sense for which we have only early authorities, e.g., *cum animo habere*, &c., *animos tollere*, *bene factum*, *consulatio*, *prospexia*, *dolus*, *venenum*, *obsequia*, *inquies*, *sellere*, *ocerpere*, *collibere*, and the like, where we may notice especially the fondness for frequentatives, which he shares with the early comedy, partly in inflections which were growing obsolete, such as *emati*, *solui*, *comperior* (dep.), *neglegisset*, *vis* (acc. pl.), *negatur*. In syntax his constructions are for the most part those of the contemporary writers.¹

Catullus. In Lucretius and Catullus we have examples of the language of poetry of the same period. The former is undoubtedly largely archaic in his style. We find *im* for *eum*, *endo* for *in*, *illac*, *illuc*, *unas*, and *alias* as genitives, *alid* for *aliud*, *rabies* as a genitive by the side of genitives in *-is*, ablatives in *-i* like *colis*, *orbi*, *parti*, nominatives in *s* for *r*, like *colis*, *vaporis*, *humoris*. In verbs there are *acutis*, *fulgitis*, *quæsit*, *confuscel* = *confusisset*, *recessu* = *recessisse*, *indiviscere* for *inmiscere*; simple forms like *figere*, *lacerare*, *cedere*, *stinguere* for the more usual compounds, the infinitive passive in *-er*, and archaic forms from *esse* like *siet*, *acit*, *fuat*. Sometimes he indulges in tmesis which reminds us of Ennius: *aque poturi*, *disque supata*, *orvis prima*. But this archaic tinge is adopted only for poetical purposes, and as a practical proof of his devotion to the earlier masters of his art; it does not affect the general substance of his style, which is of the freshest and most vigorous stamp. But the purity of his idiom is not gained by any slavish adherence to a recognized vocabulary: he coins words freely. Mr Munro has noted more than a hundred ἀνὰ λέγουσα, or words which he alone among good writers uses. Many of these are formed on familiar models, such as compounds and frequentatives; others are

directly borrowed from the Greek apparently with a view to sweetness of rhythm (ii. 412; v. 834, 505); others again (forty or more in number) are compounds of a kind which the classical language refused to adopt, such as *sihiſtragis*, *terroloquus*, *perterrepreps*. He represents not so much a stage in the history of the language as a protest against the tendencies fashionable in his own time. But his influence was deep upon Virgil, and through him upon all subsequent Latin literature. In Catullus we have the type of the language of the cultivated circles, lifted into poetry by the simple directness with which it is used to express emotion. In his heroic and elegiac poems he did not escape the influence of the Alexandrian school, and his genius is ill suited for long-continued flights, but in his lyrical poems his language is altogether perfect. As Macaulay says, "No Latin writer is so Greek. The simplicity, the pathos, the perfect grace, which I find in the great Athenian models are all in Catullus, and in him alone of the Romans." The language of these poems comes nearest perhaps to that of Cicero's more intimate letters. It is full of colloquial idioms and familiar language, of the diminutives of affection or of playfulness. Greek words are rare, especially in the lyrics, and those which are employed are only such as had come to be current coin. Archaisms are but sparingly introduced; but for metrical reasons he has four instances of the inf. pass. in *-er*, and several contracted forms; we find also *alis* and *alid*, *um* (gen.), and the antiquated *telus* and *recepto*. There are traces of the popular language in the shortened imperatives *acel* and *manē* in the analytic perfect *paratam habes*, and perhaps in the use of *venis* approaching that of the indefinite article.

The poets of the Augustan age mark the opening of a new chapter in the history of the Latin language. The influence of Horace was comparatively slight; he worked in a field of his own, and, although Statius imitated his lyrics, and Persius and Juvenal, especially the former, his satires, on the whole there are few traces of any deep marks left by him on the language of later writers. In his *Satires* and *Epistles* the diction is that of the contemporary *urbanitas*, differing hardly at all from that of Cicero in his epistles and dialogues. The occasional archaisms, such as the syncope in *errepemus*, *evasee*, *surrexe*, the infinitives in *-er*, and the genitives *deum*, *divum*, and *nummum* may be explained as still conversationally allowable, though ceasing to be current in literature; and a similar explanation may account for plebeian terms, e.g., *balatro*, *biatro*, *garrio*, *matto*, *vappa*, *caldus*, *soldus*, *surpate*, for the numerous diminutives, and for such pronouns, adverbs, conjunctions, and turns of expression as were common in prose, but not found, or found but rarely, in elevated poetry. Greek words are used sparingly, not with the licence which he censures in Lucilius, and in his hexameters are inflected according to Latin rules. In the *Odes*, on the other hand, the language is much more precisely limited. There are practically no archaisms (*spargere* in Carm. iv. 11, 8 is a doubtful exception), or plebeian expressions; Greek inflections are employed, but not with the licence of Catullus; there are no datives in *r* or *is* like *Tethyi* or *Dryasii*; Greek constructions are fairly numerous, e.g., the genitive with verbs like *regnare*, *abstinere*, *desinere*, and with adjectives, as *integer vitæ*, the so-called Greek accusative, the dative with verbs of contest, like *luctari*, *decertare*, the transitive use of many intransitive verbs in the past participle, as *regnatu*, *triumphatu*; and finally there is a "prolative" use of the infinitive after verbs and adjectives, where prose would have employed other constructions, which, though not limited to Horace, is more common with him than with other poets. Compounds are very sparingly employed, and apparently only when sanctioned by author-

¹ The character of archaism has been denied to his style by Dean Merivale; and it is true that in the matter of orthography the forms which Salust adopts, as *Crescen* has shown, were at least as common in his time as those which became afterwards the rule, but, when we compare his diction with that of Cicero, there is quite enough difference to justify the usual view, and the fact that some of his expressions are found in later writers only goes to show that they imitated him in this respect.

nty. His own innovations in vocabulary are not numerous. About eighty *novae verba* have been noted, but for the most part there is nothing very distinctive about their character, and perhaps we should find them almost entirely disappearing if the remains of contemporary literature were more extensive. Like Virgil, he shows his exquisite skill in the use of language rather in the selection from already existing stores, than in the creation of new resources. *tantum series iuncturaque pollet*. But both his diction and his syntax left much less marked traces upon succeeding writers than did those of either Virgil or Ovid.

Virgil.

In Virgil the development of the Latin language reached its full maturity. What Cicero was to the period, Virgil was to the hexameter, indeed the changes that he wrought were still more marked, inasmuch as the language of verse admits of greater subtlety and finish than even the most artistic prose. For the straightforward idiomatic simplicity of Lucretius and Catullus he substituted a most exact and felicitous choice of diction, rich with the suggestion of the most varied sources of inspiration. Sometimes it is a phrase of Homer's "conveyed" literally with happy boldness, sometimes it is a line of Ennius, or again some artistic Sophoclean combination. Virgil was equally familiar with the great Greek models of style and with the earlier Latin poets. This learning, guided by an unerring sense of fitness and harmony, enabled him to give to his diction a music which recalls at once the fullest tones of the Greek lyre and the lofty strains of the most genuinely national song. His love of antiquarianism in language has often been noticed, but it never passes into pedantry. His vocabulary and constructions are often such as would have conveyed to his contemporaries a grateful flavour of the past, but they would never have been unintelligible. Forms like *sueso, olle, or admittit* can have delayed no one.

In the details of syntax it is difficult to notice any peculiarly Virgilian points, for the reason that his language, like that of Cicero, became the canon, departures from which were accounted irregularities. But we may notice as favourite constructions a free use of oblique cases in the place of the more definite construction with prepositions usual in prose, e.g., *et clamor caelo, flet noctem, rivis currentia vina, baccatam rugie Naevon*, and many similar phrases; the employment of some substantives as adjectives, like *senator canis*, and vice versa, as *plurimus volitans*; a proleptic use of adjectives, as *tristia torquetis*; idioms involving *ille, atque, deinde, haud, quin, via*, and the frequent occurrence of passive verbs in their earlier reflexive sense, as *induor, velor, pascor* (comp. Dr Kennedy's Appendix on "Virgilian Syntax").

Livy

In Livy's singularly varied and beautiful style we have Latin prose in that rich maturity which seems to portend and almost to necessitate an early decline. To a training in the rhetorical schools, and perhaps professional experience as a teacher of rhetoric, he added a thorough familiarity with contemporary poetry and with the Greek language; and these attainments have all deeply coloured his language. It is probable that the variety of style naturally suggested by the wide range of his subject matter was increased by a half-unconscious adoption of the phrases and constructions of the different authorities whom he followed in different parts of his work; and the industry of German critics has gone far to demonstrate a conclusion likely enough in itself. Hence perhaps comes the fairly long list of archaisms, especially in formulae, which scholars have collected (cf. Kühnast, *Lin. Synt.*, pp. 14-18). These are, however, purely isolated phenomena, which do not affect the general tone. It is different with the poetical constructions and Gracianisms, which appear on every page. Of the latter we find numerous instances in the use of the cases, e.g., in genitives like *ad Spei* (sc. *templum*), *pars altera regnas*

utulationis erat, oratores pacis petendae, ira praedae omnesae, oppidum Antiochiae, aequum campi, qui capti-vorum, in dative like aeneum pectori tegumen, comitia collegas creando, quibusdam solentibus erat, prompsum veniae danda; in accusatives like *irare calumniam, certare multam, distendere hostem*; an especially frequent use of transitive verbs absolutely, and the constant omission of the reflexive pronoun as the subject of an infinitive in reported speech. To the same source must be assigned a very frequent pregnant construction with prepositions, an attraction of relatives, and a great extension of the employment of relative adverbs of place instead of relative pronouns, e.g., *quo=in quem*. Among his poetical characteristics we may place the extensive list of words which are found for the first time in his works and in those of Virgil or Ovid, and perhaps his common use of concrete words for collective, e.g., *equus for equitatus*, of abstract terms such as *remigium, servitia, robora*, and of frequentative verbs, to say nothing of poetical phrases like "*haec ubi dicte dedit*," "*adversum montium*," &c. Indications of the extended use of the subjunctive, which he shares with contemporary writers, especially poets, are found in the construction of *ante quam, post quam* with this mood, even when there is no underlying notion of purpose, of *donec*, and of *cum* meaning "whenever." On the other hand *forntan* and *quamvis*, as in the poets, are used with the indicative in forgetfulness of their original force. Among his individual peculiarities may be noticed the large number of verbal nouns in *-us* (for which Cicero prefers forms in *-io*) and in *-tor*, and the extensive use of the past passive participle to replace an abstract substantive, e.g., *ex dictatorio imperio concussio*. In the arrangement of words Livy is much more free than any previous prose writer, aiming, like the poets, at the most effective order rather than at that which is logically suggested. His periods are constructed with less regularity than those of Cicero, and gain at least as much in variety and energy as they lose in uniformity of rhythm and artistic finish. His style cannot be more fittingly described than in the language of Quintilian, who speaks of his *miris inveniat et lactea ubertas*.

The language of Propertius is too distinctly his own to Proper-call for detailed examination here. It cannot be taken as ^{thus} a specimen of the great current of the Latin language; it is rather a tributary springing from a source apart, tingling to some slight extent the stream into which it pours itself, but soon ceasing to affect it in any perceptible fashion. "His obscurity, his indirectness, and his incoherence" (to adopt the words of Professor Postgate) were too much out of harmony with the Latin taste for him to be regarded as in any sense representative; sometimes he seems to be hardly writing Latin at all. Partly from his own strikingly independent genius, partly from his profound and not always judicious study of the Alexandrian writers, his poems abound in phrases and constructions which are without a parallel in Latin poetry. His archaisms and Gracianisms, both in diction and in syntax, are very numerous; but frequently there is a freedom in the use of cases and prepositions which can only be due to bold and independent innovations. His style well deserves a careful study for its own sake (cf. Postgate's *Introduction*, pp. lvii-cxxv.); but it is of comparatively little significance in the history of the language.

The brief and few poems of Tibullus supply only what Ovid. is given much more fully in the works of Ovid. In these we have the language recognized as that best fitted for

¹ Kühnast (p. 146) holds that of more than three hundred and twenty dative in book xxix, about thirty show the influence of Greek constructions.

poetry by the fashionable circles in the later years of Augustus. The style of Ovid bears many traces of the imitation of Virgil, but it is not less deeply affected by the rhetoric of the schools. His never-failing fertility of fancy and command of diction often led him into a diffuseness which mars the effect of his best works; according to Quintilian it was only in his (lost) tragedy of *Medea* that he showed what real excellence he might have reached if he had chosen to control his natural powers rather than to give them full rein. His influence on later poets was largely for evil: if he taught them smoothness of versification and polish of language, he also co-operated powerfully with the practice of recitation to lead them to aim at rhetorical point and striking turns of expression, instead of a firm grasp of a subject as a whole, and due subordination of the general parts to the general impression. Ovid's own influence on language was not great: he took the diction of poetry as he found it, formed by the labours of his predecessors, the conflict between the archaistic and the Graecising schools was already settled in favour of the latter; and all that he did was to accept the generally accepted models as supplying the material in moulding which his luxuriant fancy could have free play. He is the pattern of the poet of society, never rising above that which was readily intelligible to the circle in which he moved, but achieving what all were attempting with consummate ease and grace. He has no deviations from classical syntax but those which were coming into fashion in his time (e.g., *fortiter* and *quoniam* with the indicative, the dative of the agent with passive verbs, the ablative for the accusative of time, the infinitive after adjectives like *certus*, *apertus*, etc.), and but few peculiarities in his vocabulary. It is only in the letters from the Pontus that luxuries of construction are detected, which show that the purity of his Latin was impaired by his residence away from Rome, and perhaps by increasing carelessness of composition.

While the leading writers of the Ciceronian and Augustan eras enable us to trace the gradual development of the Latin language to its utmost finish as an instrument of literary expression, there are some less important authors who supply valuable evidence of the character of the *sermo plebeius*. Among them may be placed the authors of the *Bellum Africanum* and the *Bellum Hispaniense* appended to Caesar's commentaries. These are not only far inferior to the exquisite *urbanitas* of Caesar's own writings; they are much rougher in style even than the less polished *Bellum Alexandrinum* and *De Bello Gallico Liber VIII.*, which are now with justice ascribed to Hirtius. There is sufficient difference between the two to justify us in assuming two different authors; but both freely employ words and constructions which are at once antiquated and vulgar. The writer of the *Bellum Alexandrinum* uses a larger number of diminutives within his short treatise than Caesar in nearly ten times the space: *postquam* and *ubi* are used with the pluperfect subjunctive; there are numerous forms unknown to the best Latin, like *tristimonia*, *exporrigere*, *cruciohitter*, and *convulnere*; *petior* is followed by the accusative, a simple relative by the subjunctive. There is also a very common use of the pluperfect for the imperfect, which seems a mark of this *plebeius sermo* (Nipparday, *Quaest. Caes.*, pp. 13-30).

Another example of what we may call the Latin of business life is supplied by Vitruvius. Besides the obscurity of many of his technical expressions, there is a roughness and looseness in his language, far removed from a literary style; he shares the incorrect use of the pluperfect, and uses plebeian forms like *calefactantur*, *faciliter*, *expertiores*, and such careless phrases as "rogavit Archimodem uti in se sumeret sibi de eo cogitationem." At a somewhat later stage we have, not merely plebeian, but also

provincial Latin represented in the *Satyricon* of Petronius. The narrative and the poems which are introduced into it are written in a style distinguished only by the ordinary peculiarities of silver Latinity, but in the numerous conversations the distinctions of language appropriate to the various speakers are accurately preserved; and we have in the talk of the slaves and provincials a perfect storehouse of words and constructions of the greatest linguistic value. Among the unclassical forms and constructions may be noticed masculines like *fatus*, *vinus*, *baineus*, *fericulus*, and *lactem* (for *lac*), *striga* for *strux*, *goudimonium* and *tristimonium*, *sanguen*, *manducare*, *nutricare*, *molestare*, *vespius* (*vespius* = Fr. *sage*), *rostrum* (= *os*), *spumas* (= *master*), *scordialis*, *baro*, and numerous diminutives like *camella*, *audaculus*, *potiuncula*, *somnuculum*, *effla*, *peduculus*, *corallum*, with constructions such as *maleducere* and *persuadere* with the accusative, and *aditulus* with the dative, and the deponent forms *pudetur* and *rideitur*. Of especial interest for the Romance languages are *astrum* (*diastre*), *berbea* (*bréba*), *botallus* (*boyau*), *improperare*, *mutua*, *naufragare*.

Suetonius (*Aug.*, c. 87) gives an interesting selection of plebeian words employed in conversation by Augustus, who for the rest was something of a purist in his written utterances: "ponit asidue et pro stulto baculum, et pro pullo pulleocum, et pro cerrito vacrosum, et rapide as habere pro male, et belizare pro languere, quod vulgo lachianzare dicitur."

The inscriptions, especially those of Pompeii, supply abundant evidence of the corruptions both of forms and of pronunciation common among the vulgar. It is not easy always to determine whether a mutilated form is evidence of a letter omitted in pronunciation, or only in writing; but it is clear that there must have been a great tendency to drop final *m*, *s*, and *t* to omit *n* before *e*, and to dull the vowel sounds, *e* and *i* being especially frequently interchanged, and *u* taking the place of *e* even in inflections. There are already signs of the confusion of *ae* and *e*, which later on became almost universal. The additions to our vocabulary are slight and unimportant (*cf. Corpus Inscr. Lat.*, vol. iv., with Zangemeister's *Indices*).

To return to the language of literature. In the dark days of Tiberius and the two succeeding emperors a paralysis seemed to have come upon prose and poetry alike. With the one exception of oratory, literature had long been the utterance of a narrow circle, not the expression of the energies of national life; and now, while all free speech in the popular assemblies was silenced, the nobles were living under a suspicious despotism, which whatever the advantage which it brought to the poorer classes and to the provincials, was to them a reign of terror. It is no wonder that the fifty years after the accession of Tiberius are in blank as regards all higher literature. Velleius Paterculus, Valerius Maximus, Celcius, and Phaedrus give specimens of the Latin of the time, but the style of no one of these, classical for the most part in vocabulary, but occasionally approaching the later usage in syntax, calls for special analysis. The elder Seneca, in his collection of *exhortationes* and *controversiae* supplies examples of the barren quibblings by which the young Romans were trained in the rhetorical schools. A course of instruction, which may have been of service when its end was efficiency in active public life, though even then not without its serious drawbacks, as is shown by Cicero in his treatise *De Oratore*, became seriously injurious when its object was merely idle display. Prose came to be overloaded with ornament, and borrowed too often the language, though not the genius, of poetry; while poetry in its turn, partly owing to the fashion of recitation, became a string of rhetorical points.

In the writers of Nero's age there are already plain

the age indications of the evil effects of the rhetorical schools upon Seneca. language as well as literature. The leading man of letters was undoubtedly Seneca the younger, "the Ovid of prose"; and his style set the model which it became the fashion to imitate. But striking and popular as it was it could not commend itself to the judgment of sound critics like Quintilian, who held firmly to the great masters of an earlier time. He admits its brilliance, and the facility of its pointed reflections, but charges the author justly with want of self-restraint, jerkiness, frequent repetitions, and tawdry tricks of rhetoric. He was the worst of models, and plagued by his very faults. In his tragedies the rhetorical elaboration of the style only serves to bring into prominence the frigidity and frequent bad taste of the matter. But his diction is on the whole fairly classical; he is, in the words of Muretus, "retutus ærmonis diligenter quam quidam inepite fastidiosi supplicatur."

Persius. In Persius there is a constant straining after rhetorical effect, which fills his verses with harsh and obscure expressions. The careful choice of diction by which his master Horace makes every word tell is exaggerated into an endeavour to gain force and freshness by the most contorted phrases. The sin of allusiveness, that besets so many young writers, is fostered by the fashion of the day for epigram, till his lines are barely intelligible after repeated reading. Conington happily suggested that this style was assumed only for satiric purposes, and pointed out that when not writing satire Persius is as simple and unaffected as Horace himself. This view, while it relieves Persius of much of the censure which has been directed against his want of judgment, makes him all the more typical a representative of this stage of silver Latinity. In his contemporary Lucan we have another example of the faults of a style especially attractive to the young, handled by a youth of brilliant but ill-disciplined powers. The *Pharsalia* abounds in spirited rhetoric, in striking epigram, in high sounding declamation, but there are no signs of sustained imagination, no ripe wisdom, no self-control in avoiding the exaggerated or the repulsive, no mature philosophy of life or human destiny. Of all the Latin poets he is the least Virgilian, so that Mervale remarks "he had never studied, one is almost tempted to believe that he had never read, Virgil."

Lucan. It has been said of him that he corrupted the style of poetry, not less than Seneca that of prose. It may be doubted whether his influence was ever great enough to produce such an effect; it is safer to say that he is the earliest poet in whom the characteristics of the silver Latinity are clearly marked.

In the silver Flavian the same tendencies are seen occasionally breaking out in the midst of the prosaic and inartistic form in which he gives out the stores of his cumbersome erudition. Wherever he attempts a loftier tone than that of the mere compiler, he falls into the tricks of Seneca. The nature of his encyclopaedic subject matter naturally makes his vocabulary very extensive; but in syntax and general tone of language he does not differ materially from contemporary writers.

Quintilian. Quintilian is of interest especially for the sound judgment which led him to a true appreciation of the writers of Rome's golden age. He set himself strenuously to resist the tawdry rhetoric fashionable in his own time, and to hold up before his pupils purer and loftier models. His own criticisms are marked by excellent taste, and often by great happiness of expression, which is pointed without being unduly epigrammatic. But his own style did not escape, as indeed it hardly could, the influences of his time; and in many small points his language falls short of classical purity. There is more approach to the simplicity of the best models in Frontinus, who furnishes a striking proof that it was rather the corruption of literary taste than any serious change in the language of ordinary

cultivated men to which the prevalent style was due. Writing on practical matters—the art of war, and the water-supply of Rome—he goes straight to the point without rhetorical flourishes; and the ornaments of style which he occasionally introduces serve to embellish but not to distort his thought.

The epic poets of the Flavian age present a striking contrast to the writers of the Claudian period. As a strained originality was the cardinal fault of the one school, so a tame and slavish following of authority is the mark of the other. The general correctness of this period may perhaps be ascribed (with Mervale) partly to the political conditions, partly to the establishment of professional schools. Teachers like Quintilian must have done much to repress extravagance of thought and language; but they could not kindle the spark of genius. Valerius Flaccus, Rutilius Silius Italicus, and Papirius Statius are all correct in their diction and in rhythm, and abound in learning; but their inspiration is drawn from books and not from nature or the heart; details are elaborated to the injury of the impression of the whole; every line is laboured, and overcharged with epigrammatic rhetoric. Statius shows by far the greatest natural ability and freshness; but he attempts to fill a broad canvas with drawing and colouring suited only to a miniature. Juvenal exemplifies the tendencies of the language of his time, as moulded by a singularly powerful mind. A careful study of the earlier poets, especially Virgil and Lucan, has kept his language up to a high standard of purity. His style is eminently rhetorical; but it is rhetoric of real power. This concisely by which it is marked seems to have been the result of a deliberate attempt to mould his natural diffuseness into the form recognized as most appropriate for satire. In his verses we notice a few metrical licences common to his age, especially the shortening of the final -o in verbs, but as a rule they are as correct as they are sonorous. In Martial the tendency of this period to witty epigram finds its most perfect embodiment, combined with finished versification. The typical prose-writers of this time are Pliny the younger and Tacitus. A study of their diction and syntax will best disclose the characteristics of the silver Latinity. Some of the features of the style of Tacitus are peculiar to himself, but on the whole the following statement represents the tendencies shared in greater or less degree by all the writers of this period. The guns he mainly in the direction of a more varied and occasionally more effective syntax, its most striking defect is a lack of harmony in the periods, of arrangement in words, of variety in particles arising from the loose connexion of sentences. The vocabulary is extended, but there are losses as well as gains. Quintilian's remarks are fully borne out by the evidence of extant authorities: on the one hand, "quid quid nihil iam proprium placet, dum parum creditur disertum, quod et alius dixisset" (viii, proem, 24); "sacrificissimum quoque poetarum figuras seu translationes mutantur; tum demum ingeniosi scilicet, si ad intelligendos nos opus est ingenio" (ib, 20); "aeridet omne quod natura detrahit" (ib, 26); on the other hand, "anne utique, cum hæc exereatit proelæ a veritate senectæ laboris inderabili verborum fastidio, ac sibi magnam partem ærmonis abscedit?" (viii, 3, 28), "multa cotidie ab antiquis facta morituræ" (ib, 6, 32).

A writer like Suetonius therefore did good service in introducing into his writings terms and phrases borrowed, not from the rhetoricians, but from the usage of daily life. In the vocabulary of Tacitus there are to be noted—
1. Words borrowed (occasionally or unconsciously) from the classical poets, especially Virgil, coming for the most part also in contemporary prose. Of these Dräger gives a list of ninety-five (*Syntax und Stil des Tacitus*, p. 56).
2. Words occurring only, or for the first time, in Tacitus. These according to the same authority number eighty-eight. For the most

Frontinus. striking proof that it was rather the corruption of literary taste than any serious change in the language of ordinary

past new formations or compounds from stems already in use, especially verbal substantives in *-io* and *-or*, *-tus* and *-ura*, *-tus* and *-endus*, with new frequentatives.

3 Words used with a meaning (e) not found in earlier prose, but sometimes (in more than eighty instances) borrowed from the poets, e.g., *conspicere*, "to bury"; *scriptura*, "a writing"; *ferax*, "armed with a sword"; (f) peculiar to later writers, e.g., *numerosus*, "numerous"; *fanctus*, "famous"; *desultor*, "to be head"; *impulserat*, "to take credit for," etc.; (g) restricted to Tacitus himself, e.g., *dispergere=disolvare*; of these Boettacher quotes one hundred and twenty-two.

Generally speaking, Tacitus likes to use a simple verb instead of a compound one, after the fashion of the poets, employs a perfect for a perfect, and (like Livy and sometimes Caesar) aims at vividness and variety by employing the present and perfect conjunctive in indirect speech even after historical tenses. Collective verbs are followed by a plural far more commonly than in Cicero. The ellipse of a verb is more frequent. The use of the cases approximates to that of the poets, and is even more free. The sensitive of limitation is common in Tacitus, though never found in Quintilian. Compound verbs are frequently followed by the accusative where the dative might have been expected, and the Virgilian construction of an accusative with infinitive and passive verb is not unusual. The dative "absolute" is shared by Tacitus with Livy, the dative of purpose and the dative with a substantive in place of a genitive are more common with him than with any writer. The ablative of separation is used without a preposition, even with names of countries and with common nouns; the ablative of place is employed similarly without a preposition, the ablative of time has sometimes the force of duration, the matricularial ablative is employed even of persons. A large extension is given to the use of the quantitative genitive after neuter adjectives and pronouns, and even adverbs, and to the genitive with active participles, and the genitive of relation after adjectives (probably by a Greekism) very freely employed. In regard to prepositions, there are special uses of *circa*, *erga*, *intra*, and *tenuis* to be noted, and a frequent tendency to interchange the use of a preposition with that of a simple case in corresponding clauses. In subordinate sentences *ut* is used for "that" and *quod*, and sometimes approaches the later use of "that"; the infinitive follows many verbs and adjectives that do not admit of this construction in classical prose, the accusative and infinitive are used after negative expressions of doubt, and even in modal and hypothetical clauses.

Like Livy, the writers of the time freely employ the conjunctive of repeated action with a relative, and extend its use to relative conjunctions, which he does not. In clauses of comparison and proportion there is frequently an ellipse of a verb (with *nihil aliud* *placuit*, *ut*, *consequens*), *tantum*, *quoniam*, and *velut* are used to imply not comparison but alleged reason; *quoniam* and *quoniam* are interchanged at pleasure. *Quoniam* and *quoniam* are commonly followed by the subjunctive, even when denoting facts. The free use of the genitive and dative of the gerundive participle to denote purpose is common in Tacitus, the former being almost limited to him. Livy's practice in the use of participles is extended even beyond the limits to which he restricts it. It has been calculated that while Caesar uses five principal clauses, Livy has sixteen, Tacitus twenty-four.

In his compressed brevity Tacitus may be said to be individual; but in the poetical colouring of his diction, in the rhetorical cast of his sentences, and in his love for picturesque and variety he is a true representative of his time.

The language of Suetonius is of interest as giving a specimen of silver Latin almost entirely free from personal idiosyncrasies; his expressions are regular and straightforward, clear and business-like; and, while in grammar he does not attain to classical purity, he is comparatively free from rhetorical affectations.

A new era commences with the accession of Hadrian (117 A.D.). As the preceding half century had been marked by the influence of Spanish Latinity (the Senecae, Lucan, Martial, Quintilian), so in this the African style was paramount. This is the period of affected archaism and pedantic learning, combined at times with a reckless love of innovation and experiment, resulting in the creation of a large number of new formations and in the adoption of much of the plebeian dialect. Fronto and Appuleius mark a strong reaction against the culture of the preceding century, and for evil far more than for good the chain of literary tradition was broken. The language which had been unduly refined and elaborated now relapsed into a

tasteful and confused patch-work, without either harmony or brilliance of colouring. In the case of the former the Proba subject matter is no set-off against the inferiority of the style. His latest editor is quite pathetic in lamenting the worthlessness of his author, and says that it would have conduced to his reputation if his works had never been unearthed. He deliberately attempts to go back to the obsolete diction of writers like Catto and Ennius. We find compounds like *altipendulus*, *rudistetrastus*, *telutiquentia*, diminutives such as *matercula*, *aulula*, *passerculus*, *sticholus*, forms like *congarrire*, *dicomancus*, *pedetentus*, *desiderantissimus* (passive), *conticinium*; *gaudio*, *oboeio*, and *pe-fungor* are used with an accusative, *modestus* with a genitive; and, if our MS. is to be trusted, the interchange of *b* and *v* has already begun. On the other hand he actually attempts to revive the form *cas* for *ara*. In Appuleius the archaic element is only one element in the Appuleian mixture which constitutes his style, and it probably ^{was} not intended to give the tone to the whole. Poetical and prosaic phrases, Greekisms, solecisms, jingling assonances, quotations, and comings apparently on the spur of the moment, all appear in this wonderful medley. There are found such extraordinary expressions as *sitire bestitudinis*, *cenae pugnatoris*, *meorum omnium*, *foras corporis*, sometimes heaped one upon another, as *fluores vetustis Araeidae et frugum pauperis Ilyraeos et odorum divites Arabas*. Diminutives are coined with reckless freedom, e.g., *autule*, *longule*, *mundule amicta et alivacule et spae papillas succinctula*. He confesses himself that he is writing in a language not familiar to him—"In urbe Latina advena stidorum Quiritium indigenam sermonem acrumabili labore, nullo magistro praesente, aggressus excolui"; and the general impression of his style fully bears out his confession. Melanchthon is hardly too severe when he says that Appuleius brays like his own ass. The language of Anlus Lucilius is much superior in purity; but still it Gellius, abounds in rare and archaic words, e.g., *edulcar*, *reccator*, *arrestator*, and in meaningless frequentatives like *solitativus*. He has some admirable remarks on the pedantry of those who delighted in obsolete expressions (xi 7) such as *apiada*, *flocus*, and *bonnator*; but his practice falls far short of his theory.

The style of the eminent lawyers of this period, foremost of whom is Gaius, deserves especial notice as showing ^{the} true literary tradition was lost; and even the poets who aimed at imitating the best models, by far the best of whom was Claudian, were led into many faults by the defective taste of their time. The sense of quantity was lost, and the practice of regarding accent as the ruling principle in metre, which had doubtless never been extinct in popular songs, and which has left plain traces in a poem quoted by Gellius (xii 11), became gradually predominant. Its effects are sometimes to be observed even in the poems of Ausonius (flor. 260 A.D.) and are plain in those of Sedulius in the next century. In Gellius the rhetorical school, which flourished greatly in the 4th century, maintained a tradition of learning, which preserved some classical range of language, but it sank by degrees into tom-

It is needless to trace in detail the gradual impoverishment and decay of disorganization of literary Latin. After the time of Gellius, there literary is no writer who deserves in any sense to be called classical. The Latin true literary tradition was lost; and even the poets who aimed at imitating the best models, by far the best of whom was Claudian, were led into many faults by the defective taste of their time. The sense of quantity was lost, and the practice of regarding accent as the ruling principle in metre, which had doubtless never been extinct in popular songs, and which has left plain traces in a poem quoted by Gellius (xii 11), became gradually predominant. Its effects are sometimes to be observed even in the poems of Ausonius (flor. 260 A.D.) and are plain in those of Sedulius in the next century.

In Gellius the rhetorical school, which flourished greatly in the 4th century, maintained a tradition of learning, which preserved some classical range of language, but it sank by degrees into tom-

The African Latinity

¹ Mr Munro (Cambridge Philosophical Society, 1860) has discussed an inscription in accented hexameters, from Cirta, dating from the 4th century of our era.

basic extravagance, and the style of Sidonius Apollinarius displays, with a profusion of erudition, an entire absence of correctness. Latin was to him no living language; his natural medium of expression was the *sermo rusticus*, and this has left its mark on every page.

Ecclesi-
astical
Latin

The influence of the Christian church in the development of the Latin language was mainly in two directions. In the first place the new conceptions introduced brought about a large extension of the vocabulary. As it is well known, the languages of the African peoples belonged to Africa (Tertullian), Cypran, Amelous, Augustine), this extension was made under the influence of the African Latinity; the newly-coined terms took an awkward and almost barbarous form, and the tendency of the time to shewmet expression and direct composition was heightened by the needs of the writers. Secondly, Christian teaching, as seen in the writings of Tertullian, thought little of the grammatical categories of their language; provided they could make themselves readily intelligible to the common people; e.g. Augustine confesses "Melius est reprehendunt vos grammatice quam non intelligent populi," and again, "Secpe mecum cogito quid esset si loquerer ut vulgus." The numerous writings of the early fathers we find a direct effect of plebeian Latinity introduced into the clumsy and affected rhetoric and the bold linguistic experiments of the African schools. Perhaps it is Tertullian who represents this stage of the language in its most extreme form. He has genuine like *vulgum* used with such words as *Congregatio fratrum*, *congregatio*, *congregatus*, *congregationis*. The plural forms employed in the boldest fashion (*e.g.*, *adulator*, *astutus*, *carnis*, *continentiosus fuisse*, *communiore*, &c.) numerous abstract words often in the plural, like *corruptioles*, *dissensioles*, *insuperabilis*, and finally the most extraordinary compounds, such as *interdubio*, *inconspicibilioribus*, *indiscutibile*, *extremulus*, *familiaritudo*.

The language of the *Vetus Italia* (a version of the Bible, made in Africa) and of the *Vulgate* has been made the subject of an admirable study by Hermann Ronsch (*Italia und Vulgata*, 21 ed., Marburg, 1875), from whom the following sketch of its leading characteristics has been mainly derived (comp. also Bernhardt, *Röm. Lit.*, pp. 384, 385). Many of the phenomena are common to the plebeian language generally, and have been already noticed as appearing occasionally in earlier writings.

1 In the formation of substantives there appears a preference for full-sounding forms, constructed by a free use of the suffixes -mentum, -nium, -arium, -orium, -ulum, -ilium, -aneum, -isum, -ura, -udo, -ntia, -itas. e.g. *nugamentum* for *nugas*, *sestionium*, *sestibulum*, or *sestorium* for *sedes*, *calenium* for *calis*, *noctibulum* for *noctes*, *dolentia* for *dolus*.

2. Plebeian terms take the place of their classical equivalents
e.g., *caballus* (=cheval), *mansio* (=maison), *bracca* (=brouche), *testa*
(=tête), *in curram* (=enfuir).

8. Substantives in *-or* and *-io* receive large additions (Ronsch gives more than one hundred and eighty of the first kind, and more than two hundred and seventy of the second kind, found either now for the first time, or previously only in writers like Plautus and Petronius).

4. Adjectives are turned into substantives. From this class are formed many Romance words: e.g., *montana* (= *montagne*), *hibernum* (= *hiver*), *diurnum* (= *giorno*), *volatile* (= *volant*, *volaille*), *matutinum* (= *mattino*, *matin*), *murale* (= *muraille*).

5 Adjectives in *-alis* and *-bilis*, *-urnus*, *-bundus*, *-lentus*, and *-osus* are largely introduced, often replacing simpler forms: e.g., *placidus* = *placens*, *aestivialis* = *aestivus*, *longiturnus*, *amarulentus*, *meticulosus*, *dignissimus*; and verbals in *-or* give rise to participial forms like *expudoratus*, *tatimoratus*, *caloratus*.

6. The terminations *-um* and *-iter* largely replace *e* in adverbs: e.g., *ordinatio*, *pressum*, *avariter*, *improbiter*.

7. Verbs of secondary derivation take the place of simple verbs, thus meeting the love for fuller forms: as *mensurare*, *amareggiare*, *tacitare*, *postulare*, *deteriorare*; an intensive force is given by composition with *ad*, *co*, *cum*, *ex*, *in*, and *ob*: e.g. *admirari*, *conquiescere*, *confortare*, *deplanare*, *elonguare*, *incrassare*, *obdilatare*; and sometimes, in imitation of the Greek, there is a double prefix, as in *admiraresecere*, *perconterere*, *obrelinguere*, *discooperire* (= *discu-*

8. Intensive and frequentative verbs are especially common, and have given rise to many Romance words; e.g., *compréssare, proiettare, raccogliere*.

9. In composition there is great freedom, and the use of the negative *in-* is very common, e.g., *imbonikos*, *discommensidatos*, *radio-audentius*, *quaterdecimus* (= *isetrarchi*), *admanuandus*. Hybrid forms are common, like *thalotheros*, *acoidia* (for *aridia*), *oxiplegatio* (*καταληψή*), *aportari* (*ἀπορρίπειν*). Especially noteworthy is the use of two prepositions or an adverb with a preposition, e.g., *de mane* (= *de mane*), *de foris* (= *de foris*), *de intus*, and *ab intus* (*domus* = *de ab intus*), *de retro* (= *de retro*), *de sursum* (= *de sursum*), *ab ante* (= *ab ante*).

10. In inflexion there are many irregularities, largely due to the reappearance of forms which had long been obsolete in the literary language, but partly produced by the love of fuller forms, often

resulting in both double words. To the first class belong *s-terms* inflected according to the second declension, e.g., *fructus, cibus, streptus*, etc.; masculine for neutors, e.g., *facinus, fignus, lignus*, etc. and, on the other hand, *nocturnus, popularis*, etc.; numerous pronominal forms, such as *alius, suus, alio* and *alio* (dat.), etc. To the second class belong *as-terms* for *as* (comp. August, *Joel* Christ, iii 8. *mallem* *quam ut alio eodem mense apertum, quia magis Labrum est*, *principes* for *princeps*, *praesumption* for *praesep*, *lampada* for *lampas*, *rete* for *rete*, etc. Comparatives and superlatives are largely invented, often with the aid of *magis* and *plus*, sometimes used pleonastically, e.g., *magis magis*. The *as-terms* have often replaced the classical forms by others which seemed more appropriate, e.g., *alio* instead of *alio* like *alio*, verbs are transferred from one conjugation to another, e.g., *florere, fugere, lignum, extergere*; compare perfects like *conatus, porrigi, collati, granditerum*, futures like *augere, porrigere, collaturo, collatus, porre, sub, equo*. Many deponents appear with *as-* forms, as so commonly in archaic Latin, and less frequently in the

[illegible][illegible]

Of Græcisms, which are very numerous in the literal versions of the Bible, the only one requiring notice here is the frequent use of *habes* with the infinitive (not unknown even to Cicero), which has given rise to the Romance future.

The changes of pronunciation which had been effected by this time consisted partly in the vulgar extension given to tondenses previously existing in the popular speech, partly in that gradual disintegration and weakening of sounds always observable in the history of a language. Our knowledge of them has to be derived almost wholly from inscriptions; for, although the conclusions deduced from the study of the popular literature of the Middle Ages afford evidence of numerous, there is usually a double doubt in the latter case whether the forms occurring bear witness to the pronunciation of the author or to that of the copyist in a later age. Interesting evidence is sometimes furnished by the rhymes found in the poets who discarded the classical forms of verse for rhyming metres. For instance, the tendency to drop a final consonant, shown in the popular literature of the Middle Ages, is illustrated by that of Sothius, who had the following rhymes: *gasterio—de, impe—time, videram—præsum, personal—pignora, militum—codicem, fœdore—originem, torridi—obstrui*. The following table (mainly from Schuchardt, *Vocalismus des Vulgarlateins*, I. 104-5) gives the principal facts of the popular pronunciation, with an indication of the periods at which the change can be proved to have taken place. The most important changes which are possible in the popular pronunciation may have been retained side by side with the corruption long after the latter make its first

The assimilation of *ai* commenced in Africa, not before the time of Alexander Severus (232-235 A.D.), and was late in extending to Italy; in Gaul it was common in the 7th century; that of *ti* was generally adopted even by the educated in the 5th century. In the 6th and 7th century *g* was dropped after vowels before *e* or *i* (*unviginti* = *viginti*) in Africa. This phenomenon had been common in Umbrian and Oscan.

The exact date of some of these changes is open to question, but it would be impossible to attempt to determine it without a fuller discussion of the evidence than is here possible. On the whole, it may be asserted with confidence that all these changes have taken place within the last two or three centuries.

The question of the relation of the Latin language to the various Romance tongues which have been derived from it is one which can be discussed in detail only under the head of the several languages. The general character of the relation is all that can be touched upon here. But it is important to notice that the Romance languages have a common origin in the mother and daughter languages "holds good only for literature. From this point of view M. Lettæ writes with justice: "Latin aïtne without doubt towards the end of the empire and after the arrival of the barbarians, and the style of Gregory of Tours is very far removed from the purity of the Latin of the first century. The language of the century of the empire. Then all at once it disappears, and we see arising, as if from under the ground, the various idioms to which it has given birth. It does suddenly and without transformation, so that these secondary languages cannot be considered as the metamorphosis or the evolution of Latin, but as new languages, born of the Latin in the new language; it died without developing itself, but it died leaving children and heirs. Such a breach of continuity is wholly unmovable as an historical procedure. From the popular Latin various dialects were gradually formed, assuming forms differing widely from the Latin of the first century. . . ."

It is true that there was much in the derived languages which cannot be shown to have existed in the popular Latin; but if we set aside what is evidently due to the action of foreign, especially Teutonic idioms—and this is to be found far more in the vocabulary than in the syntax of the Romance languages—we may not be far from the truth in saying that the Romance languages already contain the phenomena by degrees the custom grew up of confining the name *Latine* to the literary language, while the popular speech was known as *lingua Romana*. As early as 660 A. D. Minutolinus was elected bishop of Troyes. "Quia preterea, sed, non tantum in Teutonico, sed et sian in Romano, id est in Latina lingua, nonnulli sunt qui loquuntur, *Sanderum*, speaking of St. Adalard, abbot of Corbey, brings out the distinction still more clearly. "Si quis vulgaris, id est, *Romana* lingue loqueretur, omnium aliarum putaretur insonare; si aut Teutonice, alioquin perfectus, et *Latine*, in nulla omnino absonaret." The same distinction is made by the French writers of the 16th century. The words of the Latin vulgaris in the popular language *populi*, *communi*, *tertili*=*maiores* (*magis*). In the beginning of the 9th century the church ordered the priest to preach, not in literary Latin, but in the popular tongue. The oath of Strasbourg (842 A. D.), happily preserved, is a specimen of the popular Latin of the 9th century, and called with equal justice the latest specimen of the Latin of the earliest; example of the French language.

It is needless to add that assimilation, syncope, and the avoidance of a harsh concurrence of consonants, either by the rejection of one or more of them, or by the insertion of a vowel, have all played a great part in the consonantal system of the Romance languages. A table of the chief changes of consonants in combination will be found in Dies, *Grammaire des Langues Romanes*, vol. 1. p. 282.

In nouns the inflexions denoting case were generally lost and changes in their functions supplied in the genitive, dative, and ablative by the use of prepositions, and thus in two ways. On the one hand French *proposition* and Provençal, following a tendency common in popular Latin, took the accusative as the typical oblique case, and used forms thence derived for the objective case, while forms derived from the nominative constituted the subjective case; e.g., sing. subj. *murs* (= *murus*), obj. *mur* (= *murum*), plur. subj. *murs* (= *muri*), obj.

one of these, Gasparino da Barziza (died 1491), has commonly been assigned the distinction of being the father of the pure and elegant Latinity of the Renaissance. His devotion to the study of Cicero is shown by the plan which he formed to fill up, by conjectural links, the numerous deficiencies in the MSS. of the *De Oratore* then known to scholars, a design happily superseded by the discovery of the famous *Cicero Laurentinae*. Additional material was furnished by the recovery of not a few authors or portions of authors of the best period by the unreversed diligence of Poggio Bracciolini; and from henceforward the study of the Latin classics was pursued with the happiest results. Throughout the 15th century no literary acquisition was more eagerly sought than the Latin language which won for them the enthusiastic admiration of their contemporaries, and, though the learning of these eminent scholars proved not unfrequently injurious to their style by inducing an affectation of obsolete or unfamiliar words, there is no reason to deny that on the whole this acquisition was well deserved. In Germany they had a worthy rival, by some even ranked before them, in Agostino in France and England there was as yet no one who, in the judgment afterwards expressed by Erasmus, could be said to write Latin at all. As far as purity of style went, the highest pitch of excellence was doubtless reached by the Italians towards the beginning of the 16th century. Schiotti, Bembo, Petrus Martyr, and, we need not justise add, Longolius in France, wrote Latin with a grace and finish which place their works in respect of style almost on a level with those of their great model Cicero. But it cannot be denied that their fastidiousness of language often led them to sacrifice the fruits to the flowers of learning, and justly drew down upon them the witty and biting censures of Erasmus in his *Ciceronism*. In the controversy between the men of learning and the men of taste, the best tendencies of the age were decidedly on the side of the former; and the Italian scholars whose object, as Hallam well expresses it, was "to write pure Latin, to glean little morsels of Roman literature, to imitate the phrases in prose, and to leave the world to its own abuses," had little influence on the next generation in comparison with the wider culture and loftier aims of scholars like Erasmus and Melancthon. The rapid extension of a knowledge of Greek literature, especially in England, France, and Germany, from its close connection with the classics, threw themselves into the new world of thought thus revealed with an eager avidity which left little leisure for that elaborate polishing of periods which had been the delight of the Ciceronians. The 16th century saw enormous advances in the knowledge of antiquity; but the most learned were by no means always equally famous for their skill in the use of the Latin language. Even in Italy itself the most eminent writers on classical subjects approach rather to the German than to the Ciceronian type, and are more distinguished for the width of their erudition and the abundance of their quotations than for elegance or purity of style. On this side of the Alps the prevalence of the same type was, as might have been expected, all but universal. Moretus alone perhaps maintained in this generation the best traditions of style, and was pronounced, even by the judgment of the censorious Scaliger, to have written better Latin than any one since Cicero; in Italy, however, he had a formidable rival in the poet of the Ciceronians, Petrus Marsus. It shows how little Latin was now a living language that the latter, like all his school, refused to speak in Latin, for fear that the necessities of daily conversation should make him familiar with barbarous phrases, which would hardly fail to taint his written style. Others for a similar reason always resorted to the literary Greek, just as in later days some have refused to read the New Testament in the original language for fear of spoiling the purity of their Italian prose. In Germany especially the influence of Lysius founded a new school of Latinitas, based on the imitation of the silver Latinity of Tacitus and Seneca, and conspicuous for some of the merits, and more than all the faults, which have been noticed above as marking those authors. In Britain the only scholar whose style merits especial notice is George Buchanan, whose prose is hardly less admirable than his famous poetical version of the Psalms. On the whole it must be said that, while the improvement in works of reference, and in subjects of education generally (especially through the activity of the Jesuits), raised the average of correctness and purity, there is less grace and power than may be found among the best of the writers of an earlier time. As yet the use of Latin as a means of literary expression and of public business showed no signs of decline, except perhaps in Germany, where the version of the Bible by Luther and his popular works in the vernacular had given a model for literary German, and in England, where some of the great works of controversial theology, notably Hooker's *Ecclesiastical Polity*, were already published in English, doing thereby incontestable service to the dignity and the enrichment of the native tongue. But during the 17th century, as a consequence of the steady develop-

ment of the various national literatures, Latin came to be more and more merely the language of the learned. Some of the most eminent scholars belong to this period, and among them Heinsius, Grotius, Salmasius, and his more illustrious antagonist Milton are all famous for the elegance of their diction, while Scapellato and Vossius contributed largely to the scientific knowledge of grammar. But towards the end of the century complaints as to the general decay of learning frequently occur. In Germany it was almost extinct. In France the Jesuit colleges maintained the traditions of a pure Latinity with some success, and were noted for the polished though sometimes too rhetorical style in which their exercises were conducted. In England the decay of Latin was never so complete as that of Greek; and the great name of Bentley shines out conspicuous, set off, it must be admitted, by the school-boy dullness of most of his rivals. Even he did not escape the ferule of the schoolmasters; Richard Johnson of Nottingham, who claims in his *Anti-Groterius* due to have pointed out more than ninety errors in the great scholar's Latinity. In the 18th century we still find Latin used for works on science and philosophy, which appealed to the learned in all countries; to say nothing of Newton's *Principia* (1689), Burnet's *History of the Reformation* (1684), and Ray's *Synopsis* (1685), and in natural and botanical works, we find even Linnaeus in 1760 securing his *Systema Naturae* in Latin. But as an organ of general literature it may be said to have expired in the course of the 17th century. The last great philosopher who habitually employed Latin for his works was Leibnitz (1646-1716), perhaps the last important work in English theology written in Latin was Baillet's *Defence d'Adam* (1685).

The use of Latin in diplomacy did not towards the end of the 17th century. The Spanish embassy sent to the court of James I. in 1605 used sometimes Latin and sometimes French, the Latin state-papers written by Milton during the Commonwealth are well known, and in the negotiations at Münster (1648) even the French representative, M. d'Avaux, prided himself on his skill in writing Latin. But at Nymegen (1677) the Danish ambassador's claim that the Latin language should be used between the French representative and himself was rejected as an impertinence, and he was obliged to agree that, while he might employ Latin himself, French was to be the only language. At Vienna, too, the opening of the proceedings in French, he was answered by the bishop of Gurk in Latin, but the French envoy pleaded that they had forgotten their Latin, and the subsequent proceedings were conducted in French (cf. Bernard's *Lectures on Diplomacy*, pp. 158-165). Long after this time the German ambassador insisted that all negotiation should be conducted in Latin, and, although Joseph II. attempted to make German the official language of Hungary in its place, he was compelled to give way, and it was only in 1826 that Latin was for the first time displaced by Magyar in the debates of the Diet (p. 87). It may be said that the universal practice of that written communications from any European power should be made in the language of that power, but oral intercourse is carried on in French, with rare exceptions.

Authorities.—For the earliest stage of the Latin language the *Corpus Inscriptionum Latinarum*, vol. 1, of Gruenert's *Syllabus Inscriptionum Latinarum*, is indispensable. Wodeworth's *Diagnosia and Specimens of Early Latin* is very useful. Hubner's *Grundriss zu Vorlesungen über die Lateinische Grammatik* (Berlin, 1860, p. 104) contains a very complete list of all works of value upon the language. Corssen's *Ausprache Vokalismus und Betonung der Lateinischen Sprache* (2 vols., Leipzig, 1870) contains a valuable collection of the evidence as to the history of the pronunciation. Neue's *Formelnreihe* (2 vols., Berlin, 1877) is a complete storehouse of the inflexional forms. Dräger's *Historische Syntax* (2 vols., Leipzig, 1880) is extremely valuable, especially for the classical writers. Kühner's *Ausführliche Grammatik der Lateinischen Sprache* (2 vols., Hanover, 1877-78) is the most complete of recent grammars. In English the best grammars are those of Madrig, Dr Kenney, and Mr Roby. The first is excellent in the syntax, and well represents the most complete knowledge of the Latin language in its classical form to be gained without the aid of comparative philology; the second in respect of etymology too frequently adopts not only the facts but the less trustworthy theories of Corssen, while in syntax the full collection of examples is sometimes encumbered by an awkward terminology; the last is equally admirable for the clearness and fulness of its discussion of phonetics, the careful historical treatment of inflections, and the freedom and precision of its syntax. For later Latin and its connection with the Romance languages, Schuchardt's *Vokalismus des vulgärlateinischen, Ronsch's Italia und Palägia*, and Dietz's *Grammatik der Lateinischen Romanen* are the chief text-books. The diction of the most important writers can best be studied in the numerous editions of the classical authors and grammars devoted to them severally, most of which will be found mentioned in the *Index*. For the study of the Germanic languages, see the edition of Hubner's *Guida to Latin Literature*, Bernhardy's *Grundriss der Römischen Literatur* and Teuffel's *History of Roman Literature* have many useful hints as to the growth of the language. (A. S. W.)

LATIN LITERATURE. See *ROMA*.

LATITUDE. See *ASTRONOMY*, *GEODESY*, and *GEOGRAPHY* (*MATHEMATICAL*).

LATIUM, in ancient geography, was the name given to the portion of central Italy which adjoined the Tyrrhenian Sea on the west, and was situated between Etruria and Campania. The name was, however, applied in a very different sense at different times, and the extent of country comprised under this appellation varied materially. Latium originally means the land of the Latini, and in this sense, which is that alone in use historically, it was a tract of comparatively limited extent, but after the overthrow of the Latin confederacy, when the neighbouring tribes of the Hemicans, Volscians, and Auruncans, as well as the Latins properly so called, were reduced to the condition of subjects and citizens of Rome, the name of Latium was extended so as to comprise them all, and include the whole country from the Tiber to the Liris. The change thus introduced was not formally established till the reign of Augustus; but it is already recognized by Strabo (v. p. 228), as well as by Pliny, who terms the additional territory thus incorporated Latium Adjacent, while he designates the original Latium, extending from the Tiber to Circei, as Latium Antiquum. We shall confine ourselves in the first instance to the description of Latium in this limited sense, in which it figures in Roman history from the foundation of the city to the days of Cicero.

I. LATIUM ANTIQVVM. In this original sense Latium was a country of but small extent, and consisted principally of an extensive plain, now known as the Campagna di Roma, bounded towards the interior by the lofty range of the Apennines, which rise very abruptly from the plains at their foot to a height of between 4000 and 5000 feet. Several of the Latin cities, including Tibur and Praeneste, were, however, situated on the terrace-like underfalls of these mountains, while Cora, Norba, and Setia were placed in like manner on the slopes of the Volscian mountains or Monti Lepini, a rugged and lofty range, which branches off from the Apennines near Praeneste, and forms a continuous mountain barrier from thence to Terracina. In the midst of the plain thus limited rises a group of volcanic mountains, of about 30 miles in circuit, and attaining to a height of over 3000 feet, now commonly known as the Alban hills, though the designation of Albani Montes is not found in any ancient writer. But the highest summit, now called Monte Cavo, on which stood the temple of Jupiter Latiaris, was known as Mons Albanus; while the north-east summit, which almost equalled it in height, bore the name of Mount Algidus, celebrated in all ages for the dark forests of ilex with which it was covered. No volcanic eruptions are known to have taken place in these mountains within the historic period, but the remains of a crater are distinctly seen near the summit of the Mons Albanus, forming the basin now known as the Campo di Annibale, while the cup-shaped lakes known as the Alban Lake and the Lake of Nemi unquestionably occupy the basins of similar craters at a lower level on the southern slope of the mountain, and the adjacent Lacus Aricinus, now drained, was another vent of a similar character.

But, besides this distinctly volcanic group, by far the greater part of the plain now called the Campagna di Roma was formed by volcanic deposits, consisting for the most part of the rock called *tuffi*, an aggregate of volcanic sand, pebbles, and clinders or scoria, varying greatly in hardness and consistency, from a compact rock well adapted for building stone to a loose disintegrating sand known by the local name of *puzzolana*. In a few places only beds of lava are found, the most distinct of which is a continuous stream extending from the foot of the Alban hills to within 2 miles from Rome, along which the line of the

Appian Way was carried. These deposits have been formed upon previously existing beds of Tertiary formation, which here and there rise to the surface, and in the Monte Mario, a few miles north of Rome, attain to the height of 400 feet. The surface is by no means an uniform plain, like that of the Terra di Lavoro (the ancient Campania), but is a broad undulating tract, furrowed throughout by numerous depressions, with precipitous banks, serving as water-courses, though rarely traversed by any considerable stream. As the general level of the plain rises gradually, though almost imperceptibly, to the foot of the Apennines, these channels by degrees assume the character of ravines of a formidable description.

Between the volcanic tract of the Campagna and the sea there intervenes a broad strip of sandy plain, evidently formed merely by the accumulation of sand from the sea, and constituting a barren tract, still covered, as it was in ancient times, almost entirely with wood. This long belt of sandy shore extends without a break for a distance of above 30 miles from the mouth of the Tiber to the promontory of Antium (Porto d'Anzo), which is formed by a low but rocky headland, projecting out into the sea, and giving rise to the only considerable angle in this line of coast. Thence again a low sandy shore of similar character extends for about 24 miles to the foot of the Monte Circeo, an isolated mountain mass of limestone of about 9 miles in circumference, and rising to a height of 2000 feet. From the almost insulated character of this remarkable promontory, which is united to the Apennines at Terracina by a similar strip of sandy coast, between the Pontine Marshes and the sea, there can be no doubt that it was once an island, which has been gradually united to the mainland by alluvial deposits. But it is certain that these deposits must have commenced long before the historical period, and the assertion strangely ascribed by Pliny to Theophrastus, that the Circean promontory was in the days of that philosopher still an island, is certainly erroneous. The region of the Pontine Marshes, which occupies almost the whole tract between the sandy belt on the sea-shore and the Volscian mountains, extending from the southern foot of the Alban hills below Velletri to the sea near Terracina, a distance of about 30 miles, is a perfectly level plain, rendered pestilential by the stagnation of numerous streams that descend from the neighbouring mountains, and are unable to find their way through this extremely low and level tract, while their outlet to the sea is barred by the sands of the coast between Monte Circeo and Terracina.

At the earliest period of which we have any historical record the whole of the country that we have thus described, or Latium in the proper sense of the term, was inhabited by the people known to the Romans as Latini. Of their origin or ethnical affinities we have very little information, except that they belonged to the same branch of the Italian races with the Umbrians, Oscans, and Sabellians (see *ITALY*). At the same time they constituted, according to the general testimony of ancient writers, a distinct people from their neighbours the Sabines and the Volscians, who held the mountain districts adjoining their territory, as well as (in a much higher degree) from the Etruscans on the other side of the Tiber. There was once, however, a people called the Rutuli, who occupied a small portion of the Latin territory adjoining the sea-coast, and are described as a separate people under their own king,—a tradition familiar to all modern readers from its having been adopted by Virgil. But the name of the Rutuli, as that of an independent people, disappears from history at a very early period, and their capital city of Ardea was certainly one of the thirty cities that in historical times constituted the Latin league. The list of these cities given us by Dionysius of Halicarnassus, which has every appearance of

being derived from an authentic document (see Niebuhr's *Roman History*, vol. ii. p. 25), enumerates them as follows:—Aides, Aricia, Bovillae, Bubentum, Corniculum, Carventum, Cereii, Corioli, Corbio, Cora, Fontani (?), Gabii, Laurentum, Lavinium, Labicum, Lanuvium, Nomentum, Norba, Praeneste, Padum, Querquetulum, Satricum, Scaptia, Setia, Tellese, Tibur, Tussulum, Toleia, Tricrinum (?), Veitiae.

The list thus given by Dionysius is arranged in an order approximately alphabetical. Omitting the two names which are probably corrupt, and a few of which the site cannot be determined with any certainty, the others may be described according to their geographical arrangement. Laurentum and Lavinium, names so conspicuous in the legendary history of Aeneas, were situated in the sandy strip near the sea-coast, the former only 8 miles east of Ostia, which was from the first merely the port of Rome, and never figured as an independent city. Tibur extended again by Ardea, the ancient capital of the Rutuli, and some distance beyond that Antium, situated on the sea-coast, which, though not in the list of Dionysius, was certainly a Latin city. On the southern underfalls of the Alban mountains, commanding the plain at the foot, stood Lanuvium and Veitiae; Ardea rose on a neighbouring hill, and Corioli was probably situated in the plain beneath. The more important city of Tuscolum occupied one of the northern summits of the same group; while opposite to it, in a commanding situation on a lofty outlier of the Apennines, rose Praeneste, now Palestrina. Bola and Padum were in the same neighbourhood, Labicum on the slope of the Alban hills below Tuscolum, and Corbano on a rocky summit east of the same city. Tiber (Tyrol) occupied a height commanding the outlet of the river Anio. Corniculum, farther west, stood on the summit of one of three conical hills that rose abruptly out of the plain at the distance of a few miles from Monte Genaro, the nearest of the Apennines, and which were then known as the Montes Corniculani. Nomentum was a few miles farther north, between the Apennines and the Tiber, and close to the Sabias frontier. The boundary between the two nations was indeed in this part very fluctuating. Nearly in the centre of the plain of the Campagna stood Gaius; Bovillae was also in the plain, but close to the Arpin Way, where it begins to ascend the Alban hills. Several other cities—Tellese, Scaptia, and Querquetulum—mentioned in the list of Dionysius were probably situated in the Campagna, but their site cannot be determined. Satricum, on the other hand, was south of the Alban hills, apparently between Veitiae and Antium; while Cora, Norba, and Setia (all of which retain their ancient names with little modification) crowded the rocky heights which form advanced posts from the Volcanic mountains towards the Pontine Marshes.

It must be borne in mind that the list given by Dionysius belonged to a date about 490 B.C., and a considerable number of the Latin cities had before that time either been utterly destroyed or reduced to subjection by Rome, and had thus lost their independent existence. Such were Antenne and Cennina, both of them situated within a few miles of Rome, and the conquest of which was ascribed to Romulus; Fidene, about 5 miles north of the city, and close to the Tiber; and Ostium Tiberis, in the hilly tract farther north towards the Sabine frontier. Pometia also, on the borders of the Pontine Marshes, to which it was said to have given name, was a city of importance, the destruction of which was ascribed to Targuinius Superbus. But by far the most important of these extinct cities was Alba, on the lake to which it gave its name, which was, according to the tradition universally received, the parent of Rome, as well as of numerous other cities within the limits of Latium, including Gabii, Fidene, Collatia, Nomentum, and other well-known towns. Whether or not this tradition deserves to rank as historical, it appears certain that at an early period there existed a confederacy of thirty towns, of which Alba was the supreme head. A list of these is given us by Pliny (iii. 5, 968) under the name of "populi Albenses," which includes only six of those found in the list of Dionysius; and these for the most part among the more obscure and least known of the names there given; while the more powerful cities of Aricia, Lanuvium, and Tuscolum, though situated immediately on the Alban hills, are not included, and appear to have maintained a wholly independent position. This earlier

league was doubtless broken up by the fall of Alba; it was probably the increasing power of the Volsci and Aequi that led to the formation of the later league, including all the more powerful cities of Latium, as well as to the alliance concluded by them with the Romans in the consulship of Sp. Cessius (493 A.C.).

The cities of the Latin league continued to hold general meetings or assemblies from time to time at the Grove of Ferentina, a sanctuary at the foot of the Alban hills in a valley below Marino, while they had also a common place of worship on the summit of the Alban Mount (the Monte Cavo), where stood the celebrated temple of Jupiter Latiaris. The participation in the annual sacrifices at this sanctuary was regarded as typical of a Latin city, and they continued to be celebrated long after the Latins had lost their independence and been incorporated in the Roman state. This change took place in 338 B.C. During the centuries that followed down to the end of the Roman republic many of the Latin towns sank into a very decayed condition. Cicero speaks of Gabii, Labicum, and Bovillae as places that had fallen into abject poverty, while Horace refers to Gabii and Fidene as mere "deserted villages." Many of the smaller places mentioned in the list of Dionysius, or the early wars of the Romans, had altogether ceased to exist, but the statement of Pliny that fifty-three communities (*populi*) had thus perished within the boundaries of Old Latium is certainly exaggerated, and his list of the "illustrations cities" (*clara oppida*) that had thus disappeared is very confused and unintelligible. Still more erroneous is his statement that there were once twenty-four cities on the site occupied in his time by the Pontine Marshes,—an assertion not confirmed by any other authority, and utterly at variance with the physical conditions of the tract in question.

II. LATIUM NOVUM, or ADJECTIVUM, as it is termed by Pliny, comprised the territories occupied in earlier times by the Volscians, Hernicans, and Auruncans. It was for the most part a rugged and mountainous country, extending at the back of Latium proper, from the frontier of the Sabines to the sea-coast between Terracina and Sinuessa. But it was not separated from the adjacent territories by any natural feature or physical boundary, and is only by the enumeration of the towns in Pliny according to the division of Italy by Augustus that we can determine its limits. It included the upper valley of the Anio, with the towns of Sublaqueum and Trebe, the Hernican cities of Anagnin, Ferentinum, Alatrium, and Verulanum—a group of mountain strongholds on the north side of the valley of the Trebia or Sacco; together with the Volcanic cities on the south of the same valley, and in that of the Liris, the whole of which, with the exception of its extreme upper end, was included in the Volcanic territory. Here were situated Signa, Praeneste, Fabiara, Regillae, Sorae, Arpinum, Atina, Aquinum, Cassinum, and Interamnia; Arxur, or Terracina, was the only seaport that properly belonged to the Volscians, the coast from thence to the mouth of the Liris being included in the territory of the Auruncans, or Ausonians as they were termed by Greek writers, who possessed the maritime towns of Fundi, Formiae, Cereia, and Minturnae, together with Suessa in the interior, which had replaced their more ancient capital of Arundina. Sinuessa, on the sea-coast between the Liris (Gerigliano) and the Volturnus, was the last town in Latium according to the official use of the term.

Though the Apennines comprised within the boundaries of Latium do not rise to a height approaching that of the loftiest summits of the central range, they attain to a considerable altitude, and form steep and rugged mountain masses from 4000 to 6000 feet high. They are traversed by three principal valleys:—(1) that of the Anio, now called Teverone, which descends from above Sublaqueum to Tivoli, where it enters the plain of the Campagna; (2) that of the Trebia or Sacco, which has its source below Palestrina (Praeneste), and flows through a comparatively broad valley that separates the main mass of the Apennines from the Volcanic mountains or Monti Lepini, till it joins the Liris below Capranza; (3) that of the Liris or Gerigliano, which enters the confines of New Latium about 20 miles from its source, flows under the walls of Sorae, and has a very tortuous course from thence to the sea at Minturnae; its lower valley is for the most part of considerable width, and forms a fertile tract of considerable extent, bordered on both sides by hills covered with vines, olives, and fruit trees, and thickly studded with towns and villages.

It may be observed that, long after the Latins had ceased to exist

as a separate people, we meet in Roman writers with the phrase of "nomen Latinum," used not in an etymological but a purely political sense, to designate the inhabitants of all those cities on which the Romans had conferred "Latin rights" (*ius Latium*),—an inferior form of the Roman franchise, which had been granted in the first instance to certain cities of the Latium, when they became subjects of Rome, and was afterwards bestowed upon many other cities of Italy, especially the so-called Latin colonies. At a later period the same privileges were extended to places in other countries also,—as for instance to most of the cities in Sicily and Spain. All persons enjoying these rights were termed in legal phraseology "Latini" or "Latini conditionis."

For the topography of Latium, and the local history of its more important cities, the reader may consult Sir W. Gell's *Topography of Rome and its Vicinity*, 2 vols 8vo, Lond., 1834, 2d ed., 1 vol., 1846, with a valuable map; Nibby, *Anales Storico-Topografico-Antiquarie della Città del Dominio di Roma*, 3 vols 8vo, 1837, 2d ed. 1843; Westphal, *Die Römische Campagna*, 4to, Berlin, 1829; Bormann, *Alt-Latrische Choronographie und Städte-Geschichte*, 8vo, Halle, 1852; Burn's *Rome and the Campagna*, 4to, Lond., 1871; Hare's *Walks around Rome*, 2 vols 8vo, Lond., 1873. An elaborate antiquarian map of Old Latium has been long in preparation by the Cavaliere De Rosa, but has not yet made its appearance.

(H. B.)

LATONA is the Latin name of the Greek Leto, mother of Apollo and Artemis. In Greece she belongs rather to the sphere of mythology than of religion; she forms part of the surroundings of these two great deities, but is not usually a goddess to whom worship is paid or temples built. Different forms of the Latona legend are found in the various seats of Apolline religion, and the tradition which has obtained the widest literary currency is a union of the legends of these two places, formed doubtless under the unifying influence of the Delphic oracle. Latona, pregnant by Zeus, long seeks in vain for a place of refuge to be delivered. She wanders from Crete over Athens, the coasts of Thraee and Asia Minor, and the islands; at last the barren desolate isle of Delos offers itself. Pindar and later poets tell that Delos was a wandering rock borne about by the waves, till it was fixed to the bottom of the sea to serve for the birth of Apollo. Hence arose the belief that Delos could not be shaken by earthquakes,—a belief that was disproved by several shocks in historical times (Herod., vi. 98, Plin., iv. 66). In the oldest forms of the legend Hera is not mentioned, but afterwards the wanderings of Leto are ascribed to the jealousy of Hera, enraged at her amour with Zeus. In the legend the foundation of Delphi follows immediately on the birth of the god, and on the sacred way between Tempe and Delphi the giant Tityos offers violence to Leto, and is immediately slain by the arrows of Apollo and Artemis. Such are the main facts of the Leto legend in its common literary form, which is due especially to the two Homeric hymns to Apollo. We must turn from mythology to actual religion in order to discover the true character of the myth. Then we shall find that Leto is a real goddess, and not a mere mythological figure. The honour paid to her in Delphi and Delos might be explained as part of the cultus of her son Apollo, but temples to her existed in Argos, in Mantinea, and in Xanthos of Iydia, her sacred grove was on the coast of Crete. In Iydia graves are frequently placed under her protection (see *Corpus Inscr. Græc.* No. 4259, 4300, 4303, &c.), and she is also known as a goddess of fertility and as *καυροπόδος*. In these attributes we recognise the earth-goddess. Now, although in the common legends Apollo and Artemis are called the twin children of Leto, yet she appears far more conspicuously in the Apolline myths than in those which grew round the great centres of Artemis worship; moreover, in the older forms of the Apolline myths Artemis is hardly mentioned except as an after-thought, and the Homeric hymn makes them both in different places (*ἥνυ μὲν δ' Ὀρρεγὼν, τὸν δὲ κρηναὶ ἐν Δελφῇ*). Facts such as these will be readily explained

if one recognizes that the idea of Apollo and Artemis as twins is one of later growth on Greek soil, and that the two religions come from different origins in Asia Minor. Again Iydia, one of the chief homes of the Apolline religion, is precisely the country where most frequent traces are found of the worship of Leto as the great goddess. Etymological considerations point in the same direction. The Greeks always connected the word Leto with the root seen in *λαθῆναι*, *λῆθη*, &c.; but it is more probable that the resemblance is delusive, and that the origin is to be found in words which are not so distinctively Greek. Leto and Leda are both probably forms of the Lycian word *Ladu*, which means woman or lady, and the island of Lade or Late (Plin., v. 35), the town Leto, the rivers Ladon and Lethæus, were all named from the goddess.

It is clear then that Latona or Leto was the great goddess of a religion which found its way into Greece, where its mythology was harmonized to a certain extent with that of the other religious systems of the country. Everything points to Iydia as the earlier home of this religion. Zeus, by whatever name he was called, and Leto are heaven and earth, their offspring is Apollo, the ever young god of light and of the sun, born afresh every spring. The myth is the same that occurs over and over again with different names in every district of Greece and Asia Minor. But in Greece Hera was recognized as the supreme consort of Zeus, and Latona could only rank with many other goddesses of antique religions as his concubine; though even in Greece the oldest forms of the tradition recognise her as the goddess-consort, *καθ' ἡμετέρας*, of Zeus. Sappho calls her and Niobe "loving companions." The father of Leto, Coeus, must be a god in the almost forgotten religion to which she belongs.

In Greek art Leto appears usually in company with her children; in vase paintings especially she is often represented with Apollo and Artemis. The statue of Leto in the Letoon at Argos was the work of Praxiteles.

See *Atlas*, *tab. 240*, 183; Hesiod., *Theog.* 184; Coeus, *Erasm. vof den Græck. Inschr.* p. 91.

LATREILLE, PIERRE-ANDRÉ (1762-1835), French naturalist, was born in humble circumstances at Brives-la-Gaillarde, now in the department of Corrèze, France, on November 29, 1762. His abilities attracted the attention of the Baron d'Espagnac, who in 1778 placed him at the Collège Lemoine at Paris, where the Abbé Hahy was at that time a teacher. Having chosen the ecclesiastical career, he was admitted to priestly orders in 1786, and in the same year retired to Brives, devoting all the leisure which the discharge of his professional duties allowed to the study of entomology. In 1788 he returned to Paris and found means of making himself known to the leading naturalists there,—Fabricius, Olivier, Bosc, Lamarck; his first important contribution to his special sciences, a "Mémoire sur les Mutilles découvertes en France," contributed to the *Proceedings of the Society of Natural History in Paris*, procured for him the honour of admission to that body, and of being made a corresponding member of the Linnean Society of London. At the Revolution he was compelled to quit Paris, and as a priest of conservative sympathies suffered considerable hardship, he lay for some time in prison at Bordeaux, and gained his liberty at last only through the intervention of the naturalist Bory de Saint-Vincent and Dargelas. His *Précis des Caractères génériques des insectes, disposés dans un ordre naturel*, appeared at Brives in 1796. In 1798 he became a corresponding member of the Institute, and at the same time was entrusted with the task of arranging the entomological collection at the recently organized "Muséum d'Histoire Naturelle" (Jardin des Plantes); in 1814 he succeeded Olivier as member of the Académie des Sciences, and in

1831 he was made a chevalier of the Legion of Honour. For some time he acted as professor of zoology in the veterinary school at Alfort near Paris, and in 1830, when the chair of zoology of invertebrates at the Muséum was divided after the death of Lamarck, Latreille was appointed professor of zoology of crustaceans, arachnids, and insects, that of molluscs, worms, and zoophytes being assigned to De Blainville. "On me donne du pain quand je n'ai plus de dents," said Latreille, who was then in his sixty-eighth year. He died on February 6, 1833.

In addition to the works already mentioned, the numerous works of Latreille include—*Histoire naturelle générale et particulière des Crustacés et Insectes* (14 vols., 1802-5), forming part of Bonaparte's edition of Buffon; *Genera Crustaceorum et Insectorum, secundum ordinem naturalem in familias disposita*, 4 vols., 1808-7; *Considerations générales sur l'ordre et la nature des animaux composant les classes des Crustacés, des Arachnides, et des Insectes*, 1810; *Familles naturelles du règne animal, exposées méthodiquement et dans un ordre analytique*, 1825; *Cours d'Entomologie* (of which only the first volume appeared, 1831), the whole of the section "Crustacés, Arachnides, Insectes," in Cuvier's *Régne Animal*, besides many papers in the *Annales du Muséum*, the *Encyclopédie Méthodique*, the *Dictionnaire Classique d'Histoire Naturelle*, and elsewhere.

LAUBAN, chief town of a circle of the same name in the government of Lëgnitz and province of Prussian Silesia, is situated in a picturesque valley, at the junction of the lines of railway from Goritz and Sorau, 39 miles west-south-west from Liegnitz, in 51° 7' N. lat., 16° 17' E. long. Lauban is the seat of a chamber of commerce, and has a Roman Catholic and three Lutheran churches, a conventual house of the order of St. Magdalene, dating from the 14th century, a municipal library and museum, two hospitals, an orphanage, a gymnasium, and a collegiate institute for girls. The industrial establishments comprise tobacco, yarn, thread, and linen and woollen cloth manufactories, bleaching, calendering, and dyeing works, a bell-foundry, tile kilns, breweries, and oil and flour mills. In 1880 the population was 10,779.

Lauban was founded in the 10th and fortified in the 13th century. In 1487 and 1488 it was devastated by the Hussites, and in 1640 by the Swedes. In 1761 it was the headquarters of Frederick the Great. In 1816 it was the last Saxon town that made its submission to Prussia.

LAUD, WILLIAM (1573-1644), archbishop of Canterbury, was born at Reading on October 7, 1573. In 1590 he became a scholar of St John's, Oxford, and a fellow in 1593. In 1601 he entered the ministry of the church. In 1605 he married the earl of Devonshire to the divorced Lady Rich, an act which he never ceased to regret. In 1611 he became president of St John's. His career at Oxford brought him into collision with the authorities of the university. He was one of those who were revolted by the Calvinistic Puritanism which prevailed, and he upheld in a sharp irritating way the doctrines on the divine right of Episcopacy, and of the permanent existence of the church during the Middle Ages, which was regarded as rank heresy by the Puritans. In 1616 he was appointed to the deanery of Gloucester, and, with the king's approbation, removed the communion table in the cathedral to the east end. In 1621 James made him bishop of St David's, though, if a commonly received story is to be believed, he entertained grave doubts whether Laud would exercise the episcopal authority with wisdom. In 1622 the new bishop took part in a controversy with Fisher the Jesuit, on the claims of the Papal Church. His argument, which was afterwards published, was not only a serious contribution to controversial literature, but marks a distinct advance in the direction which was afterwards taken by Chillingworth.

The controversy with Fisher had been entered on in order to save Buckingham's mother from conversion to the Church of Rome. It failed in this object, but it gained for Laud considerable influence over Buckingham himself,

and through Buckingham over Prince Charles, who when he became king in 1625 was attracted to an ecclesiastical adviser whose opinions so closely resembled his own, and whose firmness of character supplied a contrast to the irresoluteness of which he could scarcely be unconscious. During the first years of the reign Laud was frequently consulted in matters relating to the church. He is found favouring the promotion of anti-Puritan divines, approving Montague's *Appello Cæsarem*, and generally throwing his weight into the scale against the assumption of the House of Commons to lay down the law in politics and religion.

In 1628 Laud was made bishop of London, and when the ecclesiastical controversy came to a head in the session of 1629, his biography became identified, till the meeting of the Long Parliament, with the history of the Church of England.

Intellectually Laud's position was that of a man opposed to the dogmatism of the Calvinists. "The wisdom of the church," he wrote, "hath been in all ages, or the most, to require consent to articles in general as much as may be, because that is the way of unity, and the church in high points requiring assent to particulars hath been rent." Laud's love of peace unhappily led him to shrink from the free exuberance of spiritual life. Perhaps it could hardly be expected, in an age when each ecclesiastical party was longing to persecute all others, that any man placed in authority should think it possible to allow the struggling parties to grow up side by side, in what must have seemed the vain hope that liberty would bring a larger harmony. Laud, at least, had no conception of the kind. He was by nature a lover of order and discipline, devoid of the higher spiritual enthusiasm or breadth of judgment which characterizes the highest order of intellect. He spoke of Aristotle, the philosopher who lays such stress on the formation of habits, as his great master in *humana*. All Laud's work in life was to attempt to form habits, to make men learn to be decent by acting decently, and to be religious by acting religiously. "Since I came to this place," he said of himself, "I laboured nothing more than that the external public worship of God—too much alighted in most parts of this kingdom—might be preserved, and that with as much decency and uniformity as might be, being still of opinion that unity cannot long continue in the church when uniformity is shut out at the church doors. And I evidently saw that the public neglect of God's service in the outward face of it, and the nasty lying of many places dedicated to that service, had almost cast a damp upon the true and inward worship of God,—which, while we live in the body, needs external helps, and all little enough to keep it in any vigour."

Upon these principles he acted, more especially after his promotion in 1633 to the archbishopric of Canterbury. His metropolitanical visitation of the province enforced his system of uniformity in every parish contained in it. He had no sympathy with the special doctrines of the Papal Church, still less with its ceremonial; but he held that conformity to the prayer book was to be the universal rule. He gave great offence to the Puritans by insisting upon the removal of the communion table to the east end of the church, while the communicants were to receive the sacrament on their knees. For this and for the enforcement of other observances he was stigmatized as an innovator, but he repelled the charge in the speech which he delivered at the trial in the Star Chamber of Prynne, Bastwick, and Burton in 1637, declaring that the Puritan usages were themselves innovations on the practice inculcated at the Reformation.

Nor did Laud confine himself to imposing ceremonies upon the clergy. The church courts undertook in those days to reform the morals of the laity, and Laud excited

much ill-feeling by insisting that the powerful and the wealthy should submit to punishment as well as the poor. As a privy councillor he took part in affairs of state, and upon the death of Portland in 1685 he became a commissioner of the treasury till he procured for Bishop Juxon the appointment of lord treasurer in 1687. The advice which he gave to the king with respect to the introduction of a new prayer book into Scotland proved ultimately fatal to him. Of this prayer book, in the amendment of which he had had a considerable share, he was not unnaturally regarded as the author; and, when in 1640 the Scots triumphantly occupied the northern counties, and sent commissioners to London to negotiate a peace, they called for the punishment of the archbishop as the great incendiary. One of the first acts of the Commons after the meeting of the Long Parliament was to impeach him. For some time he remained in prison, apparently overlooked. But in 1643 there was fresh need of conciliating the Scots, and his impeachment was proceeded with. He made an able and in many respects a satisfactory defence, but his condemnation was a foregone conclusion, and he was executed on January 10, 1644, at the age of seventy-two.

The best source of the biography of Laud is to be found in his own *Works*, edited by Dr Bliss, in the Anglo-Catholic Library. The adverse view of his character will be found in Prynne's *Cantuarv's Doom*. (S. R. G.)

LAUDANUM. See OPIUM.

LAUDER, SIR THOMAS DICK, BART. (1784-1848), was the only son of Sir Andrew Lauder, the sixth baronet, and was born at Edinburgh in 1784. He succeeded to the baronetcy in 1830. In early life he published two romances, *Lothian and the Wolf of Badenoch*; and such were the merits of his style that his first contribution to *Blackwood's Magazine* in 1817, entitled "Simon Roy, Gardener at Dunphail," was by some ascribed to the author of *Waverley*. He was afterwards a frequent contributor to *Blackwood* and also to *Tait's Magazine*, and in 1830 he published the book by which his name is now best known, *An Account of the Great Floods of August 1829 in the Province of Moray and adjoining Districts*. Subsequent works were *Highland Rambles, with Long Tales to shorten the Way* (2 vols. 8vo, 1837), *Legendary Tales of the Highlands* (3 vols. 12mo, 1841), *Tour Round the Coasts of Scotland, and Memorial of the Royal Progress in Scotland* (1843). Lauder's paper on "The Parallel Roads of Glenroy," printed in vol. ix. of the *Transactions of the Royal Society of Edinburgh*, first drew attention to the phenomenon in question. Vol. i. of a *Miscellany of Natural History*, published in 1833, was also partly prepared by Lauder. He died on May 29, 1848. An unfinished series of papers, written for *Tait's Magazine* shortly before his death, was published under the title *Scottish Rivers*, with a preface by John Brown, M.D., in 1874.

LAUBENBURG, formerly a duchy belonging with Holstein to Denmark, but from 1865 to Prussia, was in July 1875 incorporated as a circle in the Prussian province of Schleswig-Holstein. It lies on the right bank of the Elbe, between 53° 21' and 53° 48' N. lat., 10° 13' and 11° 3' E. long., is bounded by the territories of Hamburg, Lubeck, and Mecklenburg, the province of Hanover, and the circle of Oldesloe, and comprises an area of 463 square miles. The surface of the country is a slightly undulating plain. The soil, chiefly alluvial, though in some places arenaceous, is generally fertile and well cultivated, but a great portion is covered with forests, and interspersed with lakes. By means of the Stecknitz Canal, the Elbe, the principal river, is connected with the Trave. The chief agricultural products of the circle are timber, fruit, grain, hemp, flax, and vegetables. Cattle breeding affords

employment for many of the inhabitants. The railroad from Hamburg to Berlin traverses the country. The judicial administration is divided among five courts of law, over which is a superior court for the whole circle, the supreme court of appeal being at Berlin. The capital is Ratzeburg, and there are two other towns, Molin and Lauenburg. In 1880 the population amounted to 49,186, Low Saxons by descent, and with few exceptions Lutherans by confession.

The earlier inhabitants of Lauenburg were a Slavic tribe known by the name of Polabes (i. e., dwellers on the Elbe, Slavic, *Leba*). They were gradually replaced by colonists from Lower Saxony, and about the middle of the 12th century the country was conquered by Henry the Lion, and thus came under the yoke of the dukes of Saxony. Lauenburg subsequently passed into the hands of Valdemar II. of Denmark, but, having in 1227 reverted to the Saxons, it remained in their possession for over four hundred years,—from 1260, however, in the separate line of Saxe-Lauenburg. After the death of Duke Julius Francis in 1589, the line of succession having become extinct, the emperor ordered the sequestration of the duchy, but Duke George William of Brunswick-Lüneburg-Celle forcibly occupied it, paid a money indemnity to Saxony, and was recognized by the inhabitants (1614, September 1702). Upon his death in 1705, Lauenburg fell to his nephew, George I., elector of Hanover, and afterwards king of England, whose claim was eventually recognized in 1728 by imperial decree. In 1806 Lauenburg was occupied by the French, and in 1810 it was incorporated with the department of Bouches de l'Elbe. After the battle of Leipzig in 1813 it reverted to Hanover, and on the 29th May 1815 was ceded to Prussia, which on the 4th June transferred it to Denmark. After the death of Frederick VII. of Denmark (1863) there were various claimants to the duchy, but at the peace of Vienna (20th October 1864) it was ceded by Christian IX. of Denmark to Austria and Prussia. By the convention of Gastein (14th August 1865) Austria surrendered her claims to Prussia upon the payment of 2,500,000 Danish thalers (about £280,000). On the 15th September William I. of Prussia took formal possession of the duchy, but it still retained its constitution and special privileges, and was not completely and incorporated with the kingdom of Prussia until the 1st of July 1878.

LAUNCESTON, a municipal and parliamentary borough and market-town of England, in the eastern division of the county of Cornwall, is situated on a branch railway line from Plymouth, on an eminence near the Kinsey, an affluent of the Tamar, 213 miles west-south-west from London. The streets are narrow and irregular, but of late years have been considerably improved. The parish church, dedicated to St Mary Magdalene, and built of curiously carved blocks of granite, was erected in the beginning of the 16th century, but possesses a detached tower of the date 1830. There are important remains of the old castle, which was the ancient seat of the earls of Cornwall, and was frequently besieged during the wars of Charles I. For the grammar school originally established in the reign of Edward VI. a new building was erected in 1862. The trade of the town is chiefly in agricultural produce. The population of the municipal borough (area 1604 acres) increased between 1871 and 1881 from 2936 to 3217, and that of the parliamentary borough (area 14,707 acres) from 5468 to 6675.

The ancient name of Launceston was *Dunchechael*, the swelling hill. The name Launceston, originally *Launeston*, derived from an old monastery dedicated to St Stephen. From the time of the Conqueror the place has belonged to the earls of Cornwall. It was made a free borough in the reign of Henry III., and received a charter of incorporation from Queen Mary in 1566. From 1294 it returned two members to parliament until 1832, when it was deprived of one of its members, and the disfranchised borough of Newport, comprising the parish of St Stephens, was included in its boundaries. The assizes of the county were transferred to Bodmin in 1838.

LAUNCESTON, the second town of Tasmania, is situated in the north of the island, at the point where the North and South Esk unite to form the river Tamar. It is the northern terminus of the railway from Hobart Town (120 miles distant), and has regular communication by steamer with Melbourne. Among the places of note are

the Government buildings, the town-hall, a theatre, two hospitals, a public library, and a convent of the Presentation Order. The population was 10,100 in 1847, 10,668 in 1870, and 12,753 in 1881. Launceston began to be an important settlement not long after the first colonization of Tasmania. St John's Church (Episcopal) dates from 1824. The town was incorporated in 1858.

LAUREATE. See ROYAL HOUSEHOLD.

LAUREL. There are at least four shrubs or small trees which are called by this name in Great Britain, viz., the common or cherry laurel (*Cerasus Laurocerasus*, Lois.), the Portugal laurel (*C. lusitanica*, Loia.), the bay or sweet laurel (*Laurus nobilis*, L.), and the spurge laurel (*Daphne Laureola*, L.). The first two belong to the rose family (*Rosaceae*), and are regarded by Bentham and Hooker as a subgenus of *Prunus*, L. (*Genera Plantarum*, i. p. 610), to which genus Linnaeus referred them.

The common laurel is a native of the woody and sub-alpine regions of the Caucasus, of the mountains of northern Persia, of north-western Asia Minor, and of the Crimea. It was received into Europe in 1576 (De Candolle, *Prod.*, ii. p. 540), and flowered for the first time in 1583. Ray in 1688 relates that it was first brought from Trebizonde to Constantinople, thence to Italy, France, Germany, and England. Parkinson in his *Paradysus* records it as growing in a garden at Highgate in 1629; and in Johnson's edition of Gerard's *Herbal*, published in 1833, it is recorded that the plant "is now got into many of our choice English gardens, where it is well respected for the beauty of the leaves and their lasting or continual greenness" (see Loudon's *Arboretum*, ii. p. 717). The leaves of this plant are rather large, broadly lance-shaped, and of a leathery consistence, the margin being somewhat serrated. They are remarkable for their poisonous properties, giving off the odour of bitter almonds when bruised, the vapour thus issuing is sufficient to kill small insects. Cherry laurel water is a solution of the volatile oil. The leaves when cut up finely and distilled yield the oil of bitter almonds and hydrocyanic (prussic) acid. Sweetmeats, custards, cream, &c., are often flavoured with laurel-leaf water, as it imparts the same flavour as bitter almonds, but it should be used sparingly, as it is a dangerous poison, having several times proved fatal. The first case occurred in 1731, which induced a careful investigation to be made of its nature, which was discovered by Schrader in 1802 to be hydrocyanic acid. The effects of the distilled laurel-leaf water on living vegetables is to destroy them like ordinary prussic acid; while a few drops act on animals as a powerful poison. It was introduced into the British pharmacopoeia in 1839, but is more generally superseded by the use of hydrocyanic acid. The following varieties of the common laurel are in cultivation:—the Caucasian (*Prunus Laurocerasus caucasica*), which is hardier and bears very rich dark-green glossy foliage; the Versailles laurel (*P. L. latifolia*), which has larger leaves; the Colchican (*P. L. colchica*), which is a dwarf-spreading bush with narrow sharply serrated pale green leaves. There is also the variety *rotundifolia* with short broad leaves, the Grecian with narrow leaves, and the Alexandrian with very small leaves. See Hemsley's *Handbook of Hardy Trees*, &c., p. 141.

The Portugal laurel is believed to be a native of Portugal and Madeira. This tree, together with a variety called *Huxa*, Ser., which bears larger leaves and has the flowers more loosely disposed, were found growing together in 1837 on the Serra de Geres in Portugal, the former being 20 feet high while the latter attained to 70 feet. It was introduced into England about the year 1648, when it was cultivated in the Oxford Botanic Gardens. During the first half of the 18th century this plant, the common

laurel, and the holly were almost the only hardy evergreen shrubs procurable in British nurseries. They are all three tender about Paris, and consequently much less seen in the neighbourhood of that city than in England, where they stand the ordinary winters but not very severe ones. There is a variety (*myrtilifolia*) of compact habit with smaller narrow leaves, a variegated variety, and one of recent introduction (*azorica*), probably not so hardy as the Continental form. See *Handbook of Hardy Trees*, &c., p. 141.

The evergreen glossy foliage of the common and Portugal laurels render them well adapted for shrubberies, while the racemes of white flowers are not devoid of beauty. The former often ripens its insipid drupes, but the Portugal rarely does so. It appears to be less able to accommodate itself to the English climate, as the wood does not usually "ripen" so satisfactorily. Hence it is rather more liable to be cut by the frost. According to Prof. A. Gray neither the common nor the Portugal laurel stands either the summer or the winter climate of the United States.

The bay or sweet laurel (*Laurus nobilis*, L.), belongs to the family *Lauraceae*, which contains *assafras*, *benzoin*, *camphor*, and other trees remarkable for their aromatic properties. It is a large evergreen shrub, sometimes reaching the height of 60 feet, but rarely assuming a truly tree-like character. The leaves are smaller than those of the preceding laurels, possessing an aromatic and slightly bitter flavour, and are quite devoid of the poisonous properties of the cherry laurel. The small yellowish-green flowers are produced in axillary clusters, and consist of a calyx only, which encloses nine stamens in the male, the anthers of which dehisce by valves which lift upwards as in the common barberry, and carry glandular processes at the base of the filament. The fruit consists of a succulent berry surrounded by the persistent base of the calyx. The bay laurel is a native of Italy, Greece, and North Africa, and is abundantly grown in the British Isles as an evergreen shrub, as it stands most winters. The date of its introduction is unknown, but must have been previous to 1562, as it is mentioned in Turner's *Herbal* published in that year. A full description also occurs in Gerard's *Herbal*, 1597, p. 1222. It was used for strewing the floors of houses of distinguished persons in the reign of Elizabeth. Several varieties have been cultivated, differing in the character of their foliage, as the *undulata* or wave-leaved, *salsifolia* or willow-leaved, the variegated, the broad-leaved, and the curled, there is also the double-flowered variety. The bay laurel was carried to North America by the early colonists, but, like the others, apparently does not thrive there.

This laurel is generally held to be the *Daphne* of the ancients, though at least Dr Lindley, following Gerard (*Herbal*, 1768, p. 761), asserts that the Greek *Daphne* was *Zunera racemosa*. Among the Greeks the laurel was sacred to Apollo, especially in connexion with Tempe, in whose laurel grove the god himself obtained purification from the blood of the Pythian. This legend was dramatically represented at the Pythian festival once in eight years, a boy fleeing from Delphi to Tempe, and after a time being led back with song, crowned and adorned with laurel. Similar *Daphnephoria* were known elsewhere in Greece. Apollo, himself purified, was the author of purification and atonement to other penitents, and the laurel was the symbol of this power, which came to be generally associated with his person and sanctuaries. The relation of Apollo to the laurel was expressed in the legend of DAPHNE (*q.v.*). The victors in the Pythian games were crowned with the laurels of Apollo, and thus the laurel became the symbol of triumph in Rome as well as in Greece. As Apollo was the god of poets, the *Laurus Apolloarum* naturally belonged to poetic merit, and so we still have a poet laureate. The various prerogatives of the laurel among the ancients are collected by Phleg (*Hist. Nat.*, xv. 80). It was a sign of truth, like the olive branch; letters announcing victory and the arms of the victorious soldiery were garished with it; it was thought that lightning could not strike it, and the

emperor Tiberius always wore a laurel wreath during thunderstorms.¹ From its association with the divine power of purification and protection, it was often set before the door of Greek houses, and among the Romans it was the guardian of the gates of the Caesars (Ovid, *Met.*, i. 582 sq.). The laurel worn by Augustus and his successors had a miraculous history: the laurel grove at the imperial villa by the ninth milestone on the Flaminian way sprang from a shoot sent from heaven to Livus Dencilis (Sueton., *Julius*, ii.). Like the olive, the laurel was forbidden to profane use. It was employed in divination; the cracking of its leaves in the sacred flame was a good omen (Tibull., ii. 5, 81), and their silence unlucky (Propert., ii. 21), and the leaves when chewed excited a prophetic afflatus (*Ecceprædix*, comp. Tibull., *id. supra*, line 65). There is a poem enumerating the ancient virtues of the laurel by J. Passeratius, 1594.

The last of the plants mentioned above under the name of laurel is the so-called spurge laurel (*Daphne Laureola*, L.). This and one other species (*D. mezereum*, L.), the mezeuron, are the sole representatives of the family *Thymelæaceæ* in Great Britain. The spurge laurel is a small evergreen shrub, with alternate somewhat lanceolate leaves with entire margins. The green flowers are produced in early spring, and form drooping clusters at the base of the leaves. The calyx is four-cleft, and carries eight stamens in two circles of four each within the tube. The pistil forms a berry, green at first, but finally black. De Candolle says they are poisonous to all animals except singing birds. The mezeuron differs from it in blossoming before the leaves are produced, while the flowers are lilac instead of green. The bark furnishes the drug *Cortex Meseret*, for which that of the spurge laurel is often substituted. Both are powerfully astringent, but the latter is less so than the bark of mezeuron. It is now only used as an ingredient of the compound decoction of sarsaparilla (*Pharmacographia*, p. 487). Of other species in cultivation there are *D. Portuensis* from China, which has lilac flowers; *D. pontica*, a native of Asia Minor; *D. alpina*, from the Italian alps; *D. collina*, South European; and *D. Oncorubra*, the garland flower or trailing daphne, the handsomest of the hardy species. See Hemslay's *Handbook of Hardy Trees*, &c., p. 394; Loudon's *Arboretum*, iii. p. 1307 sq. (H. N.)

LAURENS, HENRY (1724-1789), American statesman, was born at Charleston, South Carolina, in 1724, of Huguenot ancestry. After receiving a good education, he entered a counting-house in London by way of preparation for commercial pursuits, in which he engaged, after his return to Charleston, with such success as to amass rapidly a large fortune. He accepted ardently the advanced views of individual rights then prevalent in the colony, and was several times engaged in stubborn contests with the crown judges, in which he resisted their alleged arbitrary and oppressive rulings, not only by all legal means at his command, but in occasional pamphlets, the vigour and legal acumen of which attracted much attention. He retired from active business in 1771, and spent the next three years in Europe in travel, and in superintending the education of his sons in England. In 1774 he united with thirty-seven other Americans in a petition to parliament against the passing of the Boston Port Bill, in the hope of averting war. Becoming convinced that a peaceful settlement was impracticable, he returned to Charleston at the close of 1774, to take part with his fellow colonists in the impending struggle. He was soon made president of the South Carolina council of safety, and in 1776 a delegate from that colony to the general continental congress at Philadelphia, of which body he was president during 1777-78. Throughout these years he was a steadfast and influential promoter of the colonial cause, and a trusted friend of Washington. In 1778 he undertook a mission as minister plenipotentiary to Holland, in furtherance of

secret negotiations for a commercial treaty which had been some time in progress, but, while on the way, he was captured by a British frigate, and taken to London. On the evidence of his papers, which he had vainly attempted to destroy, war was declared upon Holland by Great Britain, and Laurens was closely imprisoned in the Tower. During his imprisonment of nearly fifteen months, his health became greatly enfeebled, yet he steadily refused opportunities for procuring release by abandoning his patriotic principles. Having been set free late in 1781, he was appointed by congress one of the commissioners for negotiating the peace; and, proceeding to Paris with Franklin and Jay, he signed with them, on November 30, 1783, the preliminaries of the treaty. Failing health obliged him to return to Charleston, South Carolina, where he passed his remaining years in retirement, much respected and beloved by his countrymen. He died in December 1792, and, in accordance with the directions of his will, his body was burned, and the bones and ashes were carefully collected and buried. The most valuable of his papers and pamphlets have been published by the South Carolina Historical Society.

LAURENS, JOHN (1756-1782), an American revolutionary officer of distinguished bravery, son of Henry Laurens noticed above, was born at Charleston, South Carolina, in 1756. He was educated in England, and on his return to America in 1777, in the height of the revolutionary struggle, he joined Washington's staff. He soon gained his commander's confidence, which he reciprocated with the most devoted attachment, and was entrusted with the delicate duties of a confidential secretary, which he performed with much tact and skill. He was present in all Washington's battles, from that of the Brandywine to Yorktown, and his gallantry on every occasion has gained him the title of "the Bayard of the Revolution." Laurens displayed bravery even to rashness in the storming of the Chew mansion at Germantown; at Monmouth, where he saved Washington's life by rushing between him and danger, and was himself severely wounded; and at Coosahatchie, where, with a handful of men, he defeated a pass against a large English force under General Prevost, and where he was again wounded. In command of a body of light infantry at the storming of Savannah, he was among the first to penetrate the English lines, and again distinguished himself at the siege of Charleston in 1780. After the capture of Charleston by the English, he rejoined Washington, and was selected by him as a special envoy to appeal to the king of France for supplies for the relief of the American armies, which had been brought by prolonged service and scanty pay to the verge of dissolution. The more active co-operation of the French fleets with the land forces in Virginia, which was one result of his mission, brought about the unexpected overwhelming of Cornwallis at Yorktown. Laurens lost no time in rejoining the army, and at Yorktown was at the head of the American storming party which captured the first redoubt, and received the sword of Colonel Campbell, its commander. Laurens was designated with Count de Noailles to arrange the terms of a surrender, which occurred October 19, 1781, and virtually ended the war, although desultory skirmishing, especially in the south, attended the months of delay before peace was formally concluded. In one of these trifling affairs in July 1782, on the Combahee Ferry, Laurens exposed himself needlessly and was killed. Washington lamented deeply the death of Laurens, then in his twenty-seventh year, saying of him, "He had not a fault that I could discover, unless it were intrepidity bordering upon rashness."

LAURIA, or LOMIA, a city of Italy in the province of Potenza, 13 miles south of Lagonegro, consisting of a walled town on the steep side of a hill and another portion in the

¹ A similar superstition still exists among the peasants of the Pyrenees.

old feudal city, with its ancient castle, and its irregularly built houses whose slate roofs and pointed gables peep from the groves of trees which clothe the hill. On the left bank the regularly built new town extends far into the plain. The river, here 80 yards broad, is crossed by the handsome railway viaduct, a beautiful stone bridge called "Pont Neuf," and the Mayenne bridge of three pointed arches, built in the 16th century. There is communication by steamer as far as to Angers. Laval may justly claim to be one of the loveliest of French towns. Its most curious and interesting monument is the sombre-looking old castle of the counts, now transformed into a prison. The new castle, dating from the Renaissance, is now the court house. Laval possesses several churches of different periods, in that of the Trinity, which serves as the cathedral, the transept is of the 12th century while the choir is of the 16th, the chapel of the Carmelites is an imitation of the Sainte Chapelle at Paris, Notre Dame des Cordeliers, which dates from the end of the 14th century or beginning of the 15th, has some fine marble altars. Half a mile below the Mayenne bridge is the beautiful 12th century church of Avenières, with an ornamental spire of 1534 and a handsome modern pulpit. The finest remaining relic of the ancient fortifications is the Becheresse gate near the cathedral. There is a scientific museum, and a library containing 25,000 volumes. The town is embellished by fine promenades, at the entrance of one of which, facing the mairie, stands the statue of the celebrated surgeon Ambrose Paré. On the Place de Cheverus is a statue to the cardinal of that name, archbishop of Bordeaux. The principal industry of the town is the linen manufacture, introduced from Flanders in the 14th century. A large cloth hall (Halle-aux-toiles), built in last century is used now for industrial, artistic, and agricultural exhibitions. At present tickings are chiefly made. This industry occupies ten thousand workmen, who are not gathered together in great factories, but scattered all over the town. Cotton spinning is also carried on, and there are tanneries, flour-mills, foundries, paper-works, and dye-works. Here also the marbles of the neighbourhood are sawn, the greater part being converted into lime. Laval is the seat of a bishop, and has a lyceum. Population 27,000.

The history of Laval goes back only to the beginning of the 11th century, but from an early date in the feudal period the barons of Laval were distinguished by their valour and power, and by their alliances. One of them followed William the Conqueror into England. After having assumed the cross they allied themselves with the Montmorencys and Montforts, and their barony passed on later to the Colignys and the La Trémouilles. Laval was taken by Talbot in 1428. It changed hands several times during the wars of the League and the war of La Vendée in 1798.

LAVATER, JOHANN KASPAR (1741-1801), is a remarkable instance of a man who has obtained celebrity by following a bypath apart from the proper work of his life. As a preacher, theological writer, and spiritual director he occupied during his lifetime a position not very dissimilar to that held by Kable in our own day, but he survives for posterity chiefly as the author of a work on physiognomy. He was born at Zurich, November 16, 1741. Consistent with himself from the first, he manifested little application to study, but great depth of feeling, especially on religious themes, and a remarkable fluency of fervent and persuasive discourse. When barely one and twenty he greatly distinguished himself by denouncing, in conjunction with his friend the painter Fuseli, an iniquitous magistrate, who was compelled to make restitution of his ill-gotten gains. In 1769 Lavater took orders, and officiated till his death as deacon or pastor in various churches in his native city. The advantages of his manner and address, as well as his oratorical fervour and genuine

depth of conviction, gave him great personal influence, especially with women, he was extensively consulted as a casuist, and was welcomed with demonstrative enthusiasm in his numerous journeys through Germany. His mystical writings were also widely popular. Scarcely a trace however, of this influence has remained, and Lavater's name would be forgotten but for his work on physiognomy, *Physiognomische Fragmente zur Beförderung der Menschenkenntnis und Menschenliebe*, Leipzig, 1775-78, republished in French with extensive additions by the author. The fame even of this universally known book rests to a great extent upon the handsome style of publication and the accompanying illustrations. It is not to be compared with the subsequent labours of Cuvier for scientific value, and leaves the study of physiognomy as desultory and unsystematic as it found it. The author's remarks, nevertheless, frequently display remarkable acuteness and insight into character, and the illustrations render it very valuable to artists. Next to his physiognomy, Lavater is perhaps chiefly remembered for his acquaintance with Goethe, and the lively portrait of him in *Wahrheit und Dichtung*. The impression he produced upon one so dissimilar to himself shows that the man was greater than his works. At a later period Goethe became estranged from him, somewhat abruptly accusing him of superstition and hypocrisy. Of the former charge he cannot be acquitted, seeing that he had manifested a tendency to run after Cagliostro; but he seems to have been no more open to the latter than every man whose ideal of creed and conduct is too exalted to be maintained with unvarying consistency. A more cogent reason for Lavater's discredit with Goethe was his intellectual intolerance. No man was more bigoted upon paper, while in truth his heart was open to all. He was continually propounding the alternative of his own form of Christianity or atheism; and it is indeed true that, if passages in his own writings are to be taken literally, he was himself incapable of conceiving a Deity apart from the person of the Redeemer. Much that he has written might be expressed in the language of Feuerbach with but slight alteration. He had a mystic's indifference to historical Christianity, and, although esteemed by himself and others a champion of orthodoxy, was in fact only an antagonist of rationalism. During the latter years of his life his influence waned, and he incurred ridicule by some exhibitions of vanity, pardonable in the recipient of so much incense. He redeemed himself by his patriotic conduct during the troubles occasioned by the French occupation of Switzerland, which brought about his tragical death. On the taking of Zurich by the French in 1799, Lavater, while endeavouring to appease the soldiery, was shot through the body by an infuriated grenadier, and died after long sufferings borne with great fortitude, on January 2, 1801. His life was written in the following year by his son-in-law Georg Gessner, with natural partiality and unavoidable reticences, but faithfully in the main. There are more recent biographies by Hegner and Bodemann, the latter entirely from the religious point of view.

LAVAUUR, chief town of an arrondissement in the department of Tarn, France, 26 miles E.N.E. of Toulouse, stands at a height of 460 feet on the left bank of the Agout (a tributary of the Tarn), which is here crossed by a bold bridge of a single arch of 160 feet span. The most interesting monument of Lavaur is its cathedral, which dates from the 14th and 15th centuries. In front of it is an octagonal bell-tower, without a spire, 131 feet high; a second smaller square tower contains a *jaquemart* (a metal statue which strikes the hours with a hammer) of the 16th century. In the bishop's garden is the statue of Las Cases. The chief industry of Lavaur is sericulture, but wool-spinning and tanning occupy some of the people.

The town has 7500 inhabitants. It was taken by Simon de Montfort during the war of the Albigenes, and several times during the religious wars of the 16th century.

LA VENDER, botanically *Lavandula*, a genus of *Labiate* distinguished by an ovate tubular calyx, a two-lipped corolla, of which the upper lip has two and the lower three lobes, and four stamens bent downwards.

The plant to which the name of lavender is commonly applied, *Lavandula vera*, D.C., is a native of the mountainous districts of the countries bordering on the western half of the Mediterranean, extending from the eastern coast of Spain to Calabria and northern Africa, growing in some places at a height of 4500 feet above the sea-level, and preferring stony declivities in open sunny situations. It is cultivated in the open air as far north as Norway and Livonia. Lavender forms an evergreen undershrub about 2 feet high, with greyish green hoary linear leaves, rolled under at the edges when young; the branches are erect, and give a bushy appearance to the plant. The flowers are borne on a terminal spike at the summit of a long naked stalk, the spike being composed of 6-10 verticillasters or dense cymes in the axils of small, brownish, rhomboidal, tapering, opposite bracts, the verticillasters being more widely separated towards the base of the spike. The calyx is tubular, contracted towards the mouth, marked with 13 ribs and 5-toothed, the posterior tooth being the largest. The corolla is of a pale violet colour, but darker on its inner surface, tubular, two-lipped, the upper lip with two and the lower with three lobes. Both corolla and calyx are covered with stellate hairs, amongst which are imbedded shining oil glands to which the fragrance of the plant is due. The leaves and flowers of lavender are said to have been used by the ancients to perfume their baths; hence the name *Lavandula* is supposed to have been derived from *lavare*, to wash. But, although *S. Stoechas* was well known to the ancients, no allusion unquestionably referring to *L. vera* has been found in the writings of classical authors, the earliest mention of the latter plant being in the 12th century by the abbess Hildegard, who lived near Bingen on the Rhine. Under the name of *lilafant* or *lilafant* it was known to the Welsh physicians as a medicine in the 13th century. In England lavender is cultivated chiefly for the distillation of its essential oil, of which it yields on an average $\frac{1}{4}$ per cent. when freed from the stalks, but in the south of Europe the flowers form an object of trade, being exported to the Barbary states, Turkey, and America.

In Great Britain lavender is grown in the parishes of Mitham, Carshalton, and Beddington in Surrey, where about 300 acres are under cultivation, and in Hertfordshire, in the parish of Hitchin, to the extent of 50 acres. The most suitable soil seems to be a sandy loam with a calcareous substratum, and the most favourable position a sunny slope in localities elevated above the level of fog, where the plant is not in danger of early frost and is freely exposed to air and light. At Hitchin lavender is said to have been grown as early as 1668, but as a commercial speculation its cultivation dates back only to 1828. The plants at present in cultivation do not produce seed, and the propagation is always made by slips or by dividing the roots. The latter plant has only been followed since 1860, when a large number of lavender plants were killed by a severe frost. Since that date the plants have been subject to the attack of a fungus, in consequence of which the price of the oil has been considerably enhanced, and the disease is likely, if it continues, to affect seriously the cultivation of the herb. At Market Deeping in Lincolnshire, where lavender was formerly grown, its cultivation has been discontinued on this account.

The flowers are collected in the beginning of August, and taken direct to the still. The yield of oil depends in great measure upon the weather. After a wet and dull June and July the yield is sometimes only half as much as when the weather has been bright and sunshiny. From 12 to 80 lb of oil per acre is the average amount obtained. The oil contained in the stem has a more rank odour and is less volatile than that of the flowers; consequently the portion that distils over after the first hour and a half is collected separately.

The finest oil is obtained by the distillation of the flowers with out the stalks, but the labour spent upon this adds about 10s. per lb to the expense of the oil, and the same end is practically attained by the fractional distillation. The oil mellow by keeping three years, after which it deteriorates unless mixed with alcohol, it is also improved by redistillation. Oil of lavender is distilled from the wild plants in Piedmont and the South of France, especially in the village about Mont Ventoux near Avignon, and in those some leagues west of Montpellier. The best French oil realizes scarcely one-sixth of the price of the English oil. Cheaper varieties are made by distilling the entire plant.

Oil of lavender is a mobile liquid having a specific gravity from 0.78 to 0.86 (Zeller). It appears to be a simple true in variable proportion of oxygenated oils and a stearoptene, the latter being identical, according to Dumas, with common camphor. Its adulteration with alcohol may be detected by chloride of calcium dissolving in it and forming a separate layer of liquid at the bottom of the vessel. Glycerin sets in the same way. If it contain turpentine it will not dissolve in three volumes of alcohol, in which quantity the pure oil is perfectly soluble.

Lavender flowers were formerly considered good for "all disorders of the head and nerves"; a spirit prepared with them was known under the name of palmy drops. At the present day a compound spirit in the form of a lavender oil, the latter being sometimes given in conjunction with other stimulants to nervous and hysterical persons suffering from depression of spirits, or is used to give a colour and flavour to medicines.

Lavender water consists of a solution of the volatile oil in spirit of wine with the addition of the essences of musk, rose, bergamot, and ambergris, but is very rarely prepared by distillation of the flowers with spirit.

In the climate of New York lavender is scarcely hardy, but in the vicinity of Philadelphia considerable quantities are grown for the market, the dried flowers being used for sachets or scent bags and for perfuming linens, &c. In American gardens sweet basil (*Ocimum basilicum*) is frequently called lavender.

Lavandula Spica (D.C.), a species which differs from *L. vera* chiefly in its smaller size, more crowded leaves, and linear bracts, is also used for the distillation of an essential oil, which is known in England as oil of spike and in France under the name of essence d'aspic. It is used in painting on porcelain and in veterinary medicine. The oil as met with in commerce is less fragrant than that of *L. vera*,—probably because the whole plant is distilled, for the flowers of the two species are scarcely distinguishable in fragrance. *L. Spica* does not extend so far north as *L. vera*; beyond the mountains beyond 2000 feet. It cannot be cultivated in Britain except in sheltered situations. A nearly allied species, *L. lanata* (Boiss.), a native of Spain, with broader leaves, is also very fragrant, but does not appear to be distilled for oil.

Lavandula Stoechas (L.), a species extending from the Canaries to Anna Minor, is distinguished from the above plants by its blackish purple flowers, and shortly-stalked spikes crowned by conspicuous purplish sterile bracts. The flowers were official in the London pharmacopoeia as late as 1746. They are still used by the Arabs as an expectorant and antispasmodic. The Stoehades (now called the Isles of Hyères near Toulon) owe their name to the abundance of the plant growing there.

Several other species of lavender (twenty in all) are known, some of which extend as far east as to India. A few which differ from the above in having divided leaves, as *L. dentata*, *L. abrotanoides*, *L. multifida*, *L. pinnatifida*, and *L. verticillata*, have been cultivated in greenhouses, &c., in England.

Sea lavender is a name applied in England to several species of *Statice*, a genus of littoral Plumbaginaceae plants. Lavender cotton is a species of the genus *Santolina*, small, yellow-flowered, evergreen undershrub of the Composite order.

LAVOISIER, ANTOINE LAURENT (1743-1794), one of the founders of modern chemistry, was born in Paris, August 26, 1743. His father, a wealthy tradesman, gave him an excellent education at the Collège Mazarin, and encouraged his desire to adopt the career of science. On quitting college, he devoted himself to study with extraordinary ardour: he followed the astronomical and mathematical courses of Lacaille, worked in the laboratory of Rouelle, and took lessons in botany from Jussieu; he renounced all frivolous society, and even restricted himself to a diet of milk in order to repair the damage to his constitution caused by excessive application. His first public distinction was gained on the occasion of a prize offered by the Academy of Sciences for an essay on the best mode of

lighting the streets of Paris. To increase the sensitiveness of his eyes, he immersed himself for six weeks in a room hung with black, from which all light was excluded except that of the lamps experimented upon. His zeal was a pledge of success, and was rewarded with the gold medal, April 9, 1766. A multitude of subjects now engaged his attention. He presented to the Academy a masterly analysis of gypsum, travelled through France with Guettard, who was occupied in constructing the first geological map of the country, and composed a work, of which a fragment entitled *Mémoire sur les couches des montagnes* found a place in the Academy collection for 1789; refuted the prevalent error as to the conversion of water into silica by repeated distillation, and studied the phenomena of thunder and aurora, of crystallization and congelation. He became an associate of the Academy in 1768, and in 1769 obtained the lucrative post of farmer-general of the revenue, with a view to increase the resources at his command for the advancement of science.

It was about the year 1770 that the vast possibilities of the new field opened to the researches of chemists by the pneumatic discoveries of Black, Cavendish, and Priestley were recognized by Lavoisier, and the perception gave to his genius the definitive impulse hitherto wanting to it. He repeated and verified experiments which became, in his hands, the means of invalidating their authors' conclusions, and prepared to import the clear-cut precision of his own ideas into a science as yet illogical in form and incoherent in expression. His wealth and position, as well as his enthusiasm, eminently qualified him to lead a successful reform. He lived in the midst of the most stimulating society of his time. Between him and such men as Laplace, Monge, Berthollet, and Fourcroy the constant interchange of ideas established a community of opinion in physical matters so close that the separate intellectual property of each was all but completely merged in the general stock.¹ On one day in each week Lavoisier threw open his laboratory to a select few of his friends, communicated the results of his labours, and invited their criticism and advice. By this consultative system his work gained in solidity, and lost nothing in originality. On the 1st of November 1772 Lavoisier, eager to secure the credit of priority, deposited at the Academy a sealed packet containing the record of his earliest conclusions on the crucial point of metallic oxidation. The discovery by Priestley in 1774 of "dephlogisticated air" materially assisted the development of the innovating doctrine, which took the form of a fully fledged theory when Lavoisier in 1778 assigned to the new substance, with the name of "oxygen," the important functions of the universal "acidifying principle." His analysis of water in 1784, and synthesis of "fixed air" (called by him "carbonic acid," *Academy Memoirs*, 1781), opened the way for an extended view of the composition of organic as well as inorganic substances, and the anti-phlogistic chemistry was completed by the publication, in 1787, of the *Méthode de nomenclature chimique*. The reform of language effected by Lavoisier in conjunction with Guyton de Morveau, Berthollet, and Fourcroy was an indispensable prelude to the reform of thought. With the current alchemical jargon science, properly so-called, could have no fellowship. The new terminology prevailed without change for fifty years, and has been fitted, by trifling modifications, to meet the exigencies of recent progress. The acceptance of the "oxygen theory" was enormously facilitated by the defined and logical form given to it in Lavoisier's *Traité Élémentaire de chimie* (Paris, 1789). Indeed, the history of science scarcely presents a second instance of a change

so fundamental accomplished with such ease. The partitions of phlogiston did not, it is true, abandon the field without a struggle. In Berlin they met Lavoisier's demonstrations by burning him in effigy, and in Paris Lavoisier conducted, in the *Journal de Physique*, a fierce polemic against the party of innovation. The controversy was, however, brief, and its issue visibly certain. Before the end of the century the reformed chemistry was everywhere in a position of uncontested triumph.

The enlightened activity of Lavoisier was no less conspicuous in his administrative than in his scientific capacity. A prominent member of the body of farmers-general during twenty-ous years, he obtained the abolition of certain taxes equally onerous and unproductive, and earned the gratitude of the Jews of Metz by relieving them from an oppressive impost. Appointed director of the powder-works by Turgot in 1776, he not only suppressed the vexatious searches for saltpetre in the cellars of private houses, but succeeded in quadrupling the produce of the commodity. He, moreover, improved the manufacture of gunpowder so as to add one-third to its explosive force, thereby reversing the previous superiority of English over French ordnance. His philanthropic zeal was displayed in the provincial assembly of the Orléanais in 1787. In the year following he was attached to the Caisse d'escompte, and presented a report of its operations, November 21, 1788, to the Constituent Assembly. In 1790 he sat on the commission of weights and measures. In 1791 he became commissary to the treasury, where he established a system of accounts of unexampled punctuality. Requested by the National Assembly to set forth a new scheme of taxation, he composed a *tratté De la richesse territoriale de la France*, of which an extract, printed at the public expense, shows him to have been possessed of sound and liberal views on political economy. In short, to quote the words of Lalande, "Lavoisier was to be found everywhere." But those were times when to be conspicuous was to be in peril. On the 2d of May 1794, Dupin, a member of the Convention, presented a frivolous accusation against the whole of the ex-farmers-general, whose wealth constituted in itself an inexplicable crime. Lavoisier found a hiding-place for a day or two in the deserted apartments of the Academy, but, hearing that his absence was likely to prejudice the cause of his colleagues, he voluntarily gave himself up. He thought it impossible that his life could be taken, but expected the confiscation of his property, when, as he told Lalande, he proposed to earn his bread as an apothecary. Half measures, however, were not in favour with the revolutionary tribunal. On the 6th of May, he, with twenty-seven others of the same profession, was condemned to the guillotine, and two days later, the sentence was carried into execution. "Il ne leur a fallu," Lagrange remarked, "qu'un moment pour faire tomber cette tête, et cent années peut-être ne suffiront pas pour en reproduire une semblable." It is said that a petition presented in his favour met with the brutal reply: "The republic has no need of *savants*." He was propped on the scaffold by M. Paulze, whose gifted daughter he had married in 1771. He left no posterity.

To the gift of a transcendent intellect Lavoisier joined the charms of a noble person and winning manners. He was faithful to his friends, charitable to the poor, a model husband, and a patriotic public servant. His fame as the reformer of chemistry rests on no single discovery, but is involved in the first principles of the science (see CHEMISTRY, p. 463). It was his great merit to have made the balance the *ultima ratio* of the laboratory. Quantitative analysis thus became for the first time possible, and a chemical reaction took in his hands the rigid form of an algebraical equation.² His latest studies were of a physiological character, and M. Dumas³ found among his papers a piece showing that he had arrived at a remarkable anticipation of modern views concerning the relations

¹ *Œuvres de Lavoisier*, tom. i. p. 18.

² *Œuvres*, tom. i. p. 108.

³ *Leçons de Chimie*, 1861.

of organs to inorganic nature. He was probably the first to devote systematic attention to agricultural chemistry, and obtained the practical success of doubling the produce of a large farm owned by him near Blois. A striking proof of his disinterested humanity is afforded by a long and painful investigation of putrefying substances carried out solely with a view to averting accidents in sewers. Not the least notable of his achievements is that of having first formed a clear idea as to the nature of gases, and of matter generally in its relation to heat. He held that bodies exist in the solid, liquid, or gaseous states according as the attractive force of their particles is superior, equal, or inferior to the repulsive action of an universally diffused, imponderable fluid which he called "caloric." Differences of specific heat he attributed to differences of inter-molecular space. The theory, put forward by him with due reserve, formed a useful if not indispensable preliminary to further progress. He was the inventor of the gasometer, and, jointly with Laplace, his coadjutor in a series of experiments on specific heat, of the calorimeter.

A complete edition of the writings of Lavoisier was issued in four vols. 4to by the Government of Napoleon III., under the title *Œuvres de Lavoisier publiées par les soins de son Excellence le Ministre de l'Instruction publique*, Paris, 1864-68. This publication comprises, besides the works already mentioned, *Omniscience physique et chimique* (1774), a large number of memoirs from the Academy volumes (during the twenty years 1770-90 he contributed no less than fifty-eight), and numerous letters, notes, and reports relating to the various affairs in which he was engaged. At the time of his death he was preparing an edition of his collected works, and the portions ready for the press were published by his widow in 1805, in two 8vo vols. entitled *Mémoires de Chimie*. The plates in the *Traité élémentaire* were drawn and engraved by Malane Lavoisier. Biographical notices of Lavoisier are given in Fourcroy's *Notion*, and by Lalonde in Scherer's *Néologie*, Jena, 1798. For an account of his discoveries see Dumas, *Leçons sur la Philosophie Chimique*, and Béchamp, *Leçons Historiques sur la Chimie*. (A. M. C.)

L A W

THE present article will be limited to the consideration of the phenomena presented for study by positive laws. The objects which laws ought to subserve, the principles of legislation, the sphere of law, the province of government, and other topics of a similar nature which are generally to be found in writings professing to treat of law in the abstract have been discussed under the heading GOVERNMENT and elsewhere. It will be convenient, and it will be following the lines of a very remarkable development of English thought, to take actual laws as positive facts, without reference to their goodness or badness, and examine, so far as it can be done within the limits at our command, the character which they present when looked at from different points of view. This conception of the science of law, which is closely related to the scientific ideas of the time, has been developed by the efforts of the modern school of English jurists. In former times the science of law meant anything but science as we have been taught to conceive it by physical philosophers. It meant if anything a philosophy of legal principles not necessarily related to any system of actual law. A philosophy of laws actually existing on fact is what we in England at least should now consider the science of law to be. By universal consent the somewhat shifting term jurisprudence has been limited to this meaning. Jurisprudence is the science of positive laws. The present article will attempt to present simply the leading principles and conclusions of jurisprudence.

The human race may be conceived as parcelled out into a number of distinct groups or societies, differing greatly in size and circumstances, in physical and moral characteristics of all kinds. But they all resemble each other in this that they reveal on examination certain rules of conduct in accordance with which the relations of the members *inter se* are governed. Such rules we may for the present, without anticipating a somewhat difficult discussion, term laws. Each society has its own system of laws, and all the systems, so far as they are known, constitute the appropriate subject matter of jurisprudence. The jurist may deal with it in the following ways. He may first of all examine the leading conceptions common to all the systems, or in other words define the leading terms common to them all. Such are the terms *law* itself, *right*, *duty*, *property*, *crime*, and so forth, which, or their equivalents, may, notwithstanding delicate differences of connotation, be regarded as common terms in all systems. That kind of inquiry is what is known in England as analytical jurisprudence. It regards the conceptions with which it deals as fixed or stationary, and aims at expressing them distinctly and exhibiting their logical relations with each other. What is really meant by a right and by a duty, and what is the true connexion between a right and a duty, are

types of the questions proper to this inquiry. Shifting our point of view, but still regarding systems of law in the mass, we may consider them, not as stationary, but as changeable and changing, we may ask what general features are exhibited by the record of the change. Thus, somewhat crudely put, may serve to indicate the field of historical jurisprudence. In its ideal condition it would require an accurate record of the history of all legal systems as its material. As yet the record is exceedingly incomplete, and the results are proportionately limited. But whether the material be abundant or scanty, the method is the same. It seeks the explanation of institutions and legal principles in the facts of history. Its aim is to show how a given rule came to be what it is. The legislative source—the emanation of the rule from a sovereign authority—is of no importance here; what is important is the moral source—the connexion of the rule with the ideas prevalent during contemporary periods. This method, it is evident, involves, not only a comparison of successive stages in the history of the same system, but a comparison of different systems, of the Roman with the English, of the Hindu with the Irish, and so on. The historical method as applied to law may be regarded as a special example of the method of comparison. The comparative method is really employed in all generalizations about law; for, although the analysis of legal terms might be conducted with exclusive reference to one system, the advantage of testing the result by reference to other systems is obvious. But, besides the use of comparison for purposes of analysis and in tracing the phenomena of the growth of laws, it is evident that for the purposes of practical legislation the comparison of different systems may yield important results. Laws are contrivances for bringing about certain definite ends, the larger of which are identical in all systems. The comparison of these contrivances not only serves to bring their real object, often obscured as it is in details, into clearer view, but enables legislators to see where the contrivances are deficient, and how they may be improved.

The "science of law," as the expression is generally used, means the examination of laws in general in one or other of the ways just indicated. It means an investigation of laws which exist or have existed in some given society in fact—in other words, positive laws; and it means an examination not limited to the exposition of particular systems. Analytical jurisprudence is in England associated chiefly with the name of JOHN AUSTIN (q.v.), whose *Province of Jurisprudence Determined* systematized and completed the work begun in England by Hobbes, and continued at a later date and from a different point of view by Bentham. The best view of the subject will be obtained by taking Austin's principal positions in outline, and con-

sidering the criticisms which later jurists have bestowed upon them.

Austin's first position is to distinguish between laws properly so called and laws improperly so called. In any of the older writers on law, we find the various senses in which the word is used grouped together as variations of one common meaning. Thus Blackstone advances to his proper subject, municipal laws, through (1) the laws of inanimate matter, (2) the laws of animal nutrition, digestion, &c., (3) the laws of nature, which are rules imposed by God on men and discoverable by reason alone, and (4) the revealed or Divine law, which is part of the law of nature directly expounded by God. All of these are connected by this common element that they are "rules of action dictated by some superior being." And some such generalization as this is to be found at the basis of most treatises on jurisprudence which have not been composed under the influence of the analytical school. Austin disposes of it by the distinction that some of those laws are commands, while others are not commands. The so-called laws of nature are not commands, they are uniformities which resemble commands only in so far as they may be supposed to have been ordered by some intelligent being. But they are not commands in the only proper sense of that word,—they are not addressed to reasonable beings, who may or may not will obedience to them. Laws of nature are not addressed to anybody, and there is no possible question of obedience or disobedience to them. Austin accordingly pronounces them laws improperly so called, and confines his attention to laws properly so called, which are commands addressed by a human superior to a human inferior.

This distinction seems so simple and obvious that the energy and even bitterness with which Austin insists upon it now seems superfluous. But the indiscriminate identification of everything to which common speech gives the name of a law was, and still is, a fruitful source of confusion. Blackstone's statement that when God "put matter into motion He established certain laws of motion, to which all movable matter must conform," and that in those creatures that have neither the power to think nor to will such laws must be invariably obeyed, so long as the creature itself subsists, for its existence depends on that obedience, imputes to the law of gravitation in respect of both its origin and its execution the qualities of an Act of Parliament. On the other hand the qualities of the law of gravitation are imputed to certain legal principles which, under the name of the law of nature, are asserted to be binding all over the globe, so that "no human laws are of any validity if contrary to this." Nonsense like this so exasperated Austin that he never fails to stigmatize the use of "natural laws" in the sense of scientific facts as improper, or as metaphorical. A later writer has pointed out that law in the scientific sense has acquired a position of its own, from which it is impossible to dislodge it, and which involves none of the ambiguities and confusions against which Austin protested. It would be as reasonable for the man of science as for the jurist to set up his own conception of law as the only legitimate one. There is perhaps only one field of inquiry where the two opposed conceptions of law are still to be found entangled. The "laws of political economy" still hover in the minds of many between the jurist and the scientific conception. Certain economical principles appear to have acquired a double character,—that of scientific generalizations, and that of rules which may be disobeyed. Measures are pronounced to be a violation of the laws of political economy, with a vague implication that these being laws of nature any violation of them must be particularly heinous.

Having eliminated metaphorical or figurative laws, we

restrict ourselves to those laws which are commands. This word is the key to the analysis of law, and accordingly a large portion of Austin's work is occupied with the determination of its meaning. A command is an order issued by a superior to an inferior. It is a signification of desire distinguished by this peculiarity that "the party to whom it is directed is liable to evil from the other, in case he comply not with the desire." "If you are able and willing to harm me in case I comply not with your wish, the expression of your wish amounts to a command." Being liable to evil in case I comply not with the wish which you signify, I am *bound* or obliged by it, or I lie under a *duty* to obey it. The evil is called a *sanction*, and the command or duty is said to be *sanctioned* by the chance of incurring the evil. The three terms *command*, *duty*, and *sanction* are thus inseparably connected. As Austin expresses it in the language of formal logic, "each of the three terms signifies the same notion, but each denotes a different part of that notion, and connotes the residue."

All commands, however, are not laws. That term is reserved for those commands which oblige generally to the performance of acts of a class. A command to your servant to rise at such an hour on such a morning is a particular command, but not a law or rule; a command to rise always at that hour is a law or rule. Of this distinction it is sufficient to say in the meantime that it involves, when we come to deal with positive laws, the rejection of particular enactments to which by invertebrate usage the term law would certainly be applied. On the other hand it is not, according to Austin, necessary that a true law should bind persons as a class. Obligations imposed on the grantees of an office specially created by parliament would imply a law; a general order to go into mourning addressed to the whole nation for a particular occasion would not be a law.

So far we have arrived at a definition of laws properly so called. Austin holds superiority and inferiority to be necessarily implied in command, and such statements as that "laws emanate from superiors" to be the merest tautology and trifling. Elsewhere he sums up the characteristics of true laws as ascertained by the analysis thus:—(1) laws, being commands, emanate from a determinate source; (2) every sanction is an evil annexed to a command; and (3) every duty implies a command, and chiefly means obnoxiousness to the evils annexed to commands.

Of true laws, those only are the subject of jurisprudence which are laws strictly so called, or positive laws. Austin accordingly proceeds to distinguish positive from other true laws, which are either laws set by God to men or laws set by men to men, not, however, as political superiors nor in pursuance of a legal right. The discussion of the first of these true but not positive laws leads Austin to his celebrated discussion of the Utilitarian theory. The laws set by God are either revealed or unrevealed, i.e., either expressed in direct command, or made known to men in one or other of the ways denoted by such phrases as the "light of nature," "natural reason," "dictates of nature," and so forth. Austin maintains that the principle of general utility, based ultimately on the assumed benevolence of God, is the true index to such of His commands as He has not chosen to reveal. His exposition of the meaning of the principle is a most valuable contribution to moral science, though he rests its claims ultimately on a basis which many of its supporters would disavow. And the whole discussion is now generally condemned as lying outside the proper scope of the treatise, although the reason for so condemning it is not always correctly stated. It is found in such assumptions of fact as that there is a God, that He has issued commands to men in what Austin calls the "truths of revelation," that He designs the happiness of all His creatures, that there is a predominance of good in

the order of the world—which do not now command universal assent. It is impossible to place these propositions on the same scientific footing as the assumptions of fact with reference to human society on which jurisprudence rests. If the "Divine laws" were facts like Acts of Parliament, it is conceived that the discussion of their characteristics would not be out of place in a scheme of jurisprudence.

The second set of laws properly so called, which are not positive laws, consists of three classes.—(1) those which are set by man living in a state of nature; (2) those which are set by sovereigns but not as political superiors, *e.g.*, when one sovereign commands another to act according to a principle of international law, and (3) those set by subjects but not in pursuance of legal rights. This group, to which Austin gives the name of positive morality, helps to explain his conception of positive law. Men are living in a state of nature, or a state of anarchy, when they are not living in a state of government or as members of a political society. "Political society" thus becomes the central fact of the theory, and some of the objections that have been urged against it arise from its being applied to conditions of life in which Austin would not have admitted the existence of a political society. Again, the third set in the group is intimately connected with positive laws on the one hand and rules of positive morality which are not even laws properly so called on the other. Thus laws set by subjects in consequence of a legal right are clothed with legal sanctions, and are laws positive. A law set by guardian to ward, in pursuance of a right which the guardian is bound to exercise, is a positive law pure and simple, a law set by master to slave, in pursuance of a legal right which he is not bound to exercise, is, in Austin's phraseology, to be regarded both as a positive moral rule and as a positive law.¹ On the other hand the rules set by a club or society, and enforced upon its members by exclusion from the society, but not in pursuance of any legal right, are laws, but not positive laws. They are imperative and proceed from a determinate source, but they have no legal or political sanction. Closely connected with this positive morality, consisting of true but not positive laws, is the positive morality whose rules are not laws properly so called at all, though they are generally denominated laws. Such are the laws of honour, the laws of fashion, and, most important of all, international law.

Nowhere does Austin's phraseology come more bluntly into conflict with common usage than in pronouncing the law of nations (which in substance is a compact body of well-defined rules resembling nothing so much as the ordinary rules of law) to be not laws at all, even in the wider sense of the term. That the rules of a private club should be law properly so called, while the whole mass of international jurisprudence is mere opinion, shocks our sense of the proprieties of expression. Yet no man was more careful than Austin to observe these proprieties. He recognizes fully the futility of definitions which involve a painful struggle with the current of ordinary speech. But in the present instance the apparent paradox cannot be avoided if we accept the limitation of laws properly so called to commands proceeding from a determinate source. And that limitation is so generally present in our conception of law that to ignore it would be a worse anomaly than this. No one finds fault with the statement that the so-called code of honour or the dictates of fashion are not, properly speaking, laws. We repeat the same statement applied to the law of nature, because it resembles in so many of its most

striking features—in the certainty of a large portion of it, in its terminology, in its substantial principles—the most universal elements of actual systems of law, and because, moreover, the assumption that brought it into existence was nothing else than this, that it consisted of those abiding portions of legal systems which prevail everywhere by their own authority. But, though "positive morality" may not be the best phrase to describe such a code of rules, the distinction insisted on by Austin is unimpeachable.

The elimination of those laws properly and improperly so called which are not positive laws brings us to the definition of positive law, which is the keystone of the system. Every positive law is "set by a sovereign person, or sovereign body of persons, to a member or members of the independent political society wherein that person or body is sovereign or superior." Though possibly sprung directly from another source, it is a positive law, by the institution of that present sovereign in the character of a political superior. The question is not as to the historical origin of the principle, but as to its present authority. "The legislator is he, not by whose authority the law was first made, but by whose authority it continues to be law." This definition involves the analysis of the connected expressions *sovereignty*, *subjection*, and *independent political society*, and of *determinate body*,—which last analysis Austin performs in connexion with that of commands. These are all excellent examples of the logical method of which he was so great a master. The broad results alone need be noticed here.

In order that a given society may form a society political and independent, the *generality* or *bulk* of its members must be in a *habit* of obedience to a certain and common superior; whilst that certain person or body of persons must not be *habitually* obedient to a certain person or body. All the italicized words point to circumstances under which it might be difficult to say whether a given society is political and independent or not. Several of these Austin has discussed,—*e.g.*, the state of things in which a political society yields obedience which may or may not be called habitual to some external power, and the state of things in which a political society is divided between contending claimants for sovereign power, and it is uncertain which shall prevail, and over how much of the society. So long as that uncertainty remains we have a state of *anarchy*. Further, an independent society to be political must not fall below a number which can only be called considerable. Neither then in a state of anarchy, nor in inconsiderable communities, nor among men living in a state of nature, have we the proper phenomena of a political society. The last limitation goes some way to meet the most serious criticism to which Austin's system has been exposed, and it ought to be stated in his own words. He supposes a society which may be styled independent, which is considerable in numbers, and which is in a savage or extremely barbarous condition. In such a society, "the bulk of its members is not in the habit of obedience to one and the same superior. For the purpose of attacking an external enemy, or for the purpose of repelling an attack, the bulk of its members who are capable of bearing arms submit to one leader or one body of leaders. But as soon as that emergency passes the transient submission ceases, and the society reverts to the state which may be deemed its ordinary state. The bulk of each of the families which compose the given society renders habitual obedience to its own peculiar chief, but those domestic societies are themselves independent societies, or are not united and compacted into one political society by habitual and general obedience to one common superior, and there is no law (simply or strictly so called) which can be called the law of that society. The so-called laws which are common to the bulk of the community are purely and properly

¹ This appears to be an unnecessary complication. The sovereign has authorized the master to set the law, although not compelling him to do so, and enforces the law when set. There seems no good reason why the law should be called a rule of positive morality at all.

customary laws—that is to say, laws which are set or imposed by the general opinion of the community, but are not enforced by legal or political sanctions." Such, he says, are the savage societies of hunters and fishers in North America, and such were the Germans as described by Tacitus. He takes no account of societies in an intermediate stage between this and the condition which constitutes political society.

We need not follow the analysis in detail. Much ingenuity is displayed in grouping the various kinds of government, in detecting the sovereign authority under the disguises which it wears in the complicated State system of the United States or under the fictions of English law, in elucidating the precise meaning of abstract political terms. Incidentally the source of many celebrated fallacies in political thought is laid bare. That the question who is sovereign in a given state is a question of fact and not of law or morals or religion, that the sovereign is incapable of legal limitation, that law is such by the sovereign's command, that no real or assumed compact can limit his action—are positions which Austin has been accused of enforcing with needless iteration. He has cleared them, however, from the air of paradox with which they had been previously encumbered, and his influence was in no direction more widely felt than in making them the commonplaces of educated opinion in this generation.

Passing from these, we may now consider what has been said against the theory, which may be summed up in the following terms. Laws, no matter in what form they are expressed, are in the last resort reducible to commands set by the person or body of persons who are in fact sovereigns in any independent political society. The sovereign is the person or persons whose commands are habitually obeyed by the great bulk of the community; and by an independent society we mean that such sovereign head is not himself habitually obedient to any other determinate body of persons. The society must be sufficiently numerous to be considerable before we can speak of it as a political society. From command, with its inseparable incident of sanction, come the duties and rights in terms of which laws are for the most part expressed. Duty means that the person of whom it is predicated is liable to the sanction in case he fails to obey the command. Right means that the person of whom it is predicated may set the sanction in operation in case the command be disobeyed.

Before noticing the considerable body of hostile criticism with which in the main we are unable to agree, we may here interpolate a doubt whether the condition of independences on the part of the head of a community is essential to the legal analysis. It seems to us that we have all the elements of a true law present when we point to a community habitually obedient to the authority of a person or determinate body of persons, no matter what the relations of that superior may be to any external or superior power. Provided that in fact the commands of the lawgiver are those beyond which the community never looks, it seems unnecessary to inquire whether this lawyer in turn takes his orders from somebody else or is habitually obedient to such orders when given. One may imagine a community governed by a dependent legislative body or person, while the supreme sovereign whose representative and nominee such body or person may be never directly addresses the community at all. We do not see that in such a case anything is gained in clearness by representing the law of the community as set by the sovereign, rather than the dependent legislator. Nor is the ascertainment of the ultimate seat of power necessary to define political societies. That we get when we suppose a community to be in the habit of obedience to a single person or to a determinate combination of persons.

The use of the word "command" is not unlikely to lead to a misconception of Austin's meaning. When we say that a law is a command of the sovereign, we are apt to think of the sovereign as enunciating the rule in question for the first time. Many laws are not traceable to the sovereign at all in this sense. Some are based upon immemorial practices, some can be traced to the influence of private citizens, whether practicing lawyers or writers on law, and in most countries a vast body of law owes its existence as such to the fact that it has been observed as law in some other society. The

great bulk of modern law owes its existence and its shape ultimately to the labours of the Roman lawyers of the empire. Austin's definition has nothing to do with this, the historical origin of laws. Most books dealing with law in the abstract generalize the modes in which laws may be originated under the name of the "sources" of law, and one of these is legislation, or the direct command of the sovereign body. The commonness of laws with each other as principles is properly the subject-matter of historical jurisprudence, the ideal perfection of which would be the establishment of the general laws governing the evolution of law in the technical sense. Austin's definition looks, not to the authorship of the law as a principle, not to its inventor or originator, but to the person or persons who in the last resort cause it to be obeyed. If a given rule is enforced by the sovereign it is a law.

It may be convenient to notice here what is usually said about the sources of law, as the expression sometimes proves a stumbling-block to the appreciation of Austin's system. In the *corpus juris* of any given country only a portion of the laws is traceable to the direct expression of his commands by the sovereign. Legislation is one, but only one, of the sources of law. Other portions of the law may be traceable to other sources, which may vary in effect in different systems. The list given in the *Institutes* of Justinian of the ways in which law may be made—*lex, plebiscitum, decretum, placita, edicta magistratuum*, and so on—is a list of sources. Among the sources of law other than legislation which are most commonly exemplified are the laws made by judges in the course of judicial decisions, and law originating as custom. The source of the law in the one case is the judicial decision, in the other the custom. In consequence of the dominion and in consequence of the custom the rule has prevailed. English law is largely made up of principles derived in each of those ways, while it is deficient in principles derived from the writings of independent teachers, such as have in other systems exercised a powerful influence on the development of law. The *responso prudentium*, the opinions of learned men, published as such, did undoubtedly originate an immense portion of Roman law. No such influence has affected English law to any appreciable extent—a result owing to the activity of the courts of the legislature. This difference has profoundly affected the form of English law as compared with the systems which have been developed by the play of free discussion. These are the most definite of the influences to which the beginning of laws may be traced. The law once established, no matter how, is nevertheless law in the sense of Austin's definition. It is enforced by the sovereign authority. It was originated by something very different. But when we speak of it as a command we refer to the way in which it is to-day presented to the subject. The newest order of an Act of Parliament is not more positively presented to the people as a command to be obeyed than are the elementary rules of the common law for which no legislative origin can be traced. It is not even necessary to resort to the figure of speech by which alone, according to Sir Henry Maine (*Early History of Institutions*, p. 814), the common law can be regarded as the commands of the Government. "The common law," he says, "consists of their commands because they can repeal or alter or restate it at pleasure."

"They command because, being by the assumption possessed of uncontrollable force, they could enforce without limit at any moment." On the contrary, it may be said that they command because they do as a matter of fact enforce the rules laid down in the common law. It is not because they could innovate if they pleased in the common law that they are said to command it, but because it is known that they will enforce it as it stands.

The criticism of Austin's analysis resolved itself into two different sets of objections. One relates to the theory of sovereignty which underlies it; the other to its alleged failure to include rules which in common parlance are laws, and which it is felt ought to be included in any satisfactory definition of law. As the latter is to some extent anticipated and admitted by Austin himself, we may deal with it first.

A recent writer¹ has been at great pains to collect a number of laws or rules of law which do not square with the Austinian definition of law as a command creating rights and duties. Take the rule that "every will must be in writing." It is a very circuitous way of looking at duties, according to Mr Harrison, to say that such a rule creates a specific right in any determinate person of a definite description. So, again, the rule that "a legacy to the witness of a will is void." Such a rule is not "designed to give any one any rights, but simply to protect the public against wills made under undue influence." Again, the

¹ Mr Frederic Harrison in the *Fortnightly Review* (vol. xxx., xxxi.)

technical rule in Shelley's case that a gift to A for life, followed by a gift to the heirs of A, is a gift to A in fee simple, is pronounced to be inconsistent with the definition. It is an idle waste of ingenuity to force any of these rules into a form in which they might be said to create rights.

This would be a perfectly correct description of any attempt to take any of these rules separately and analyse it into a complete command creating specific rights and duties. But there is no occasion for doing anything of the kind. It is not contended that every grammatically complete sentence in a text-book or a statute is *per se* a command creating rights and duties. A law, like any other command, must be expressed in words, and will require the use of the usual aids to expression. The gist of it may be expressed in a sentence which, standing by itself, is not intelligible, other sentences locally separate from the principal one may contain the exceptions and the modifications and the interpretations to which that is subject. In no one of these taken by itself, but in the substance of them all taken together, is the true law, in Austin's sense, to be found. Thus the rule that every will must be in writing is a mere fragment—only the limb of a law. It belongs to the rule which fixes the rights of devisees or legatees under a will. That rule in whatever form it may be expressed is, without any straining of language, a command of the legislator. That "every person named by a testator in his last will and testament shall be entitled to the property thereby given him" is surely a command creating rights and duties. After testament add "expressed in writing"; it is still a command. Add further, "provided he be not one of the witnesses to the will," and the command, with its product of rights and duties, is still there. Each of the additions limits the operation of the command stated imperatively in the first sentence. So with the rule in Shelley's case. It is resolvable into the rule that every person to whom an estate is given by a conveyance expressed in such and such a way shall take such and such rights. To take another example from recent legislation. A statute passed in 1861 enacts nothing more than this, that an Act of a previous session shall be construed as if "that" meant "this." It would be futile indeed to force this into conformity with Austin's definition by treating it as a command addressed to the judges, and as indirectly creating rights to have such a construction respected. As it happens, the section of the previous Act referred to (the Burials Act, 1860) is an undeniable command, addressed to the clergy, and imposing upon them a specific duty. The true command—the law—is to be found in the two sections taken together.

All this confusion arises from the fact that laws are not habitually expressed in imperative terms. Even in a mature system like that of England the great bulk of legal rules is hidden under forms which disguise their imperative quality. They appear as principles, maxims, propositions of fact, generalizations, points of pleading and procedure, and so forth. Even in the statutes the imperative form is not uniformly observed. It might be said that the more mature a legal system is the less do its individual rules take the form of commands. The greater portion of Roman law is expressed in terms which would not become scientific or speculative treatises. The institutional works abound in propositions which have no legal significance at all, but which are not distinguished from the true law in which they are embedded by any difference in the forms of expression. Assertions about matters of history, dubious speculations in philology, and reflexions on human conduct are mixed up in the same narrative with genuine rules of law. Words of description are used, not words of command, and rules of law assimilate themselves in

form to the extraneous matter with which they are mixed up.

It has been said that Austin himself admitted to some extent the force of these objections. He includes among laws which are not imperative the following—"declaratory laws, or laws explaining the import of existing positive law, and laws abrogating or repealing existing positive law." He thus associates them with rules of positive morality and with laws which are only metaphorically so called. This collocation is unfortunate and out of keeping with Austin's method. Declaratory and repealing laws are as completely unlike positive morality and metaphorical laws as are the laws which he describes as properly so called. And if we avoid the error of treating each separate proposition enunciated by the lawgiver as a law, the cases in question need give us no trouble. Read the declaratory and the repealing statutes along with the principal laws which they affect, and the result is perfectly consistent with the proposition that all law is to be resolved into a species of command. In the one case we have in the principal taken together with the interpretative statute a law, and whether it differs or not from the law as it existed before the interpretative statute was passed makes no difference to the true character of the latter. It contributes along with the former to the expression of a command which is a true law. In the same way repealing statutes are to be taken together with the laws which they repeal—the result being that there is no law, no command, at all. It is wholly unnecessary to class them as laws which are not truly imperative, or as exceptions to the rule that laws are a species of commands. The combination of the two sentences in which the lawgiver has expressed himself, yields the result of silence—absence of law—which is in no way incompatible with the assertion that a law, when it exists, is a kind of command. Austin's theory does not logically require us to treat every Act of Parliament as being a complete law in itself, and therefore to set aside a certain number of Acts of Parliament as being exceptions to the great generalization which is the basis of the whole system.

Rules of procedure again have been alleged to constitute another exception. They cannot, it is said, be regarded as commands involving punishment if they be disobeyed. Nor is anything gained by considering them as commands addressed to the judge and other ministers of the law. There may be no doubt in the law of procedure a great deal that is resolvable into law in this sense, but the great bulk of it is to be regarded like the rules of interpretation as entering into the substantive commands which are laws. They are descriptions of the sanction and its mode of working. The bare prohibition of murder without any penalty to enforce it would not be a law. To prohibit it under penalty of death implies a reference to the whole machinery of criminal justice by which the penalty is enforced. Taken by themselves, the rules of procedure are not, any more than canons of interpretation, complete laws in Austin's sense of the term. But they form part of the complete expression of true laws. They imply a command, and they describe the sanction and the mode in which it operates.

A more formidable criticism of Austin's position is that which attacks the definition of sovereignty. There are countries, it is said, where the sovereign authority cannot by any stretch of language be said to command the laws, and yet where law manifestly exists. The ablest and the most moderate statement of this view is given by Sir Henry Maine in *Early History of Institutions*, p. 880:—

"It is from no special love of modern examples that I take one from India, but because it happens to be the most modern precedent in point. My instance is the Indian province called the Punjab, the country of the Five Rivers, in the state in which it was for about

a quarter of a century before its annexation to the British Indian empire. After passing through every conceivable phase of anarchy and dormant anarchy, it fell under the tolerably consolidated dominion of a half military half religious oligarchy known as the Sikhs. The Sikhs themselves were afterwards reduced to subjection by a single chieftain belonging to their order, Runjeet Singh. At first sight there could be no more perfect embodiment than Runjeet Singh of sovereignty as conceived by Austin. He was absolutely despotic. Except occasionally on his wild frontier he kept the most perfect order. He could have commanded anything; the smallest disobedience to his commands would have been followed by death or mutilation; and this was perfectly well known to the enormous majority of his subjects. Yet I doubt whether once in all his life he issued a command which Austin would call a law. He took as his revenue a prodigious share of the produce of the soil. He harried villages which reallocated at his exactions, and he executed great numbers of men. He levied great armies, he had all material of power, and he exercised it in various ways. But he never made a law. The rules which regulated the lives of his subjects were derived from their immemorial usages, and those rules were administered by domestic tribunals in families or village communities—that is, in groups no larger or little larger than those to which the application of Austin's principles cannot be effected on his own admission without absurdity."

So far as the mere size of the community is concerned, there is no difficulty in applying the Austinian theory. In postulating a considerably numerous community Austin was thinking evidently of small isolated groups which could not without provoking a sense of the ridiculous be termed nations. Two or three families, let us suppose, occupying a small island, totally disconnected with any great power, would not claim to be and would not be treated as an independent political community. But it does not follow that Austin would have regarded the village communities spoken of by Maine in the same light. Here we have a great community, consisting of a vast number of small communities, each independent of the other, and disconnected with all the others, so far as the administration of anything like law is concerned. Suppose in each case that the headman or council takes his orders from Runjeet Singh, and enforces them, each in his own sphere, relying as the last resort on the force at the disposal of the sultan. The mere size of the separate communities would make no sort of difference to Austin's theory. He would probably regard the empire of Runjeet Singh as divided into small districts,—an assumption which invests no doubt the true historical order, the smaller group being generally more ancient than the larger. But provided that the other conditions prevail, the mere fact that the law is administered by local tribunals for minute areas should make no difference to the theory. The case described by Sir Henry Maine is that of the undoubted possession of supreme power by a sovereign, coupled with the total absence of any attempt on his part to originate a law. That no doubt is, as we are told by the same authority, "the type of all Oriental communities in their native state during their rare intervals of peace and order." The empire was in the main in each case a tax-gathering empire. The unalterable law of the Modes and Persians was not a law at all but an occasional command. So again Maine puts his position clearly in the following sentences:—"The Athenian assembly made true laws for residents on Attic territory, but the dominion of Athens over her subject cities and islands was clearly a tax-taking as distinguished from a legislating empire." Sir Henry Maine, it will be observed, does not say that the sovereign assembly did not command the laws in the subject islands—only that it did not legislate.

In the same category may be placed without much substantial difference all the societies that have ever existed on the face of the earth previous to the point at which legislation becomes active. Sir Henry Maine is undoubtedly right in connecting the theories of Bentham and Austin with the overwhelming activity of legislation in modern times. And formal legislation, as he has elsewhere

shown, comes late in the history of most legal systems. Law is generated in other ways, which seem irreconcilable with anything like legislation. Not only the tax-gathering emperors of the East, indifferent to the condition of their subjects, but even actively benevolent Governments have up to a certain point left the law to grow by other means than formal enactments. What is *ex facie* more opposed to the idea of a sovereign's commands than the conception of schools of law? Does it not "sting us with a sense of the ridiculous" to hear principles which are the outcome of long debates between Froulans and Sabinians described as commands of the emperor? How is sectarianism in law possible if the sovereign's command is really all that is meant by a law? No mental attitude is more common than that which regards law as a natural product—discoverable by a diligent investigator, much in the same way as the facts of science or the principles of mathematics. The introductory portions of Justinian's *Institutes* are certainly written from this point of view, which may also be described without much unfairness as the point of view of German jurisprudence. And yet the English jurist who accepts Austin's postulate as true for the English system of our own day would have no difficulty in applying it to German or Roman law generated under the influence of such ideas as these.

Again, referring to the instance of Runjeet Singh, Sir H. Maine says no doubt rightly that "he never did or could have dreamed of changing the civil rules under which his subjects lived. Probably he was as strong a believer in the independent obligatory force of such rules as the elders themselves who applied them." That too might be said with truth of states to which the application of Austin's system would be far from difficult. The sovereign body or person enforcing the rules by all the ordinary methods of justice might conceivably believe that the rules which he enforced had an obligatory authority of their own, just as most lawyers at one time, and possibly some lawyers now, believe in the natural obligatoriness, independently of courts or parliaments, of portions of the law of England. But nevertheless, whatever ideas the sovereign or his delegates might entertain as to "the independent obligatory force" of the rules which they enforce, the fact that they do enforce them distinguishes them from all other rules. Austin seizes upon this peculiarity and fixes it as the determining characteristic of positive law. When the rule is enforced by a sovereign authority as he defines it, it is his command, even if he should never so regard it himself, or should suppose himself to be unable to alter it in a single particular.

It may be instructive to add to these examples of dubious cases one taken from what is called ecclesiastical law. In so far as this has not been adopted and enforced by the state, it would, on Austin's theory, be not positive law, but either positive morality or possibly a portion of the Divine law. No jurist would deny that there is an essential difference between so much of ecclesiastical law as is adopted by the state and all the rest of it, and that for scientific purposes this distinction ought to be recognized. How near this kind of law approaches to the positive or political law may be seen from the sanctions on which it depended. "The theory of penitential discipline was this, that the church was an organized body with an outward and visible form of government; that all who were outside her boundaries were outside the means of divine grace; that she had a command laid upon her, and authority given to her, to gather men into her fellowship by the ceremony of baptism, but, as some of those who were admitted proved unworthy of their calling, she also had the right by the power of the keys to deprive them temporarily or absolutely of the privilege of communion with her, and on their amendment to restore them once more to church membership. On this power of excommunication and restoration was founded the system of ecclesiastical discipline. It was a purely spiritual jurisdiction. It extended its hold over the minds of men from the belief, universal in the catholic church of the early ages, that he who was expelled from her pale was expelled also from the way of salvation, and that the sentence which was pronounced by God's church on earth was ratified by Him in heaven" (Smith's *Dictionary of Christian Antiquities*, art. "Penance," p. 1667).

These laws are not the laws of the jurists, though they resemble them closely in many points—indeed in all points except that of the sanction by which they are enforced. It is a spiritual not a political sanction. The force which lies behind them is not that of the sovereign or the state. When physical force is used to compel obedience to the laws of the church they become positive laws. But so long as the belief in future punishments or the fear of the purely spiritual punishments of the church is sufficient to procure obedience to them, they are to be regarded as commands, not by the state, but by the church. That difference Austin makes essential. In rejecting spiritual laws from the field of positive law, his example would be followed by jurists who would nevertheless include other laws, not ecclesiastical in purpose, but enforced by very similar methods.

Compare the following account of "the mode in which justice was administered in the neighbourhood of Benares towards the end of the last century," extracted from a very valuable work on the scientific study of Hindu law by Mr. J. H. Nelson. "The recognized mode of compelling a debtor to pay up appears to have been, by sending a Brahman to do *dharma* before his house with a dagger or a bowl of poison to be used by the Brahman on his own body if the debtor proved obstinate. When the tax collector gave too much trouble, a ryot would sometimes erect a *kar* or pile of wood and burn an old woman on it by way of language as to the head of the tormentor. The *tes talous* obtained in the following shape. Persons who considered themselves aggrieved by acts of their enemies would kill their own wives and children, in order, as we may suppose, to compel their enemies to do a similar act to their own hurt. Thus two Brahmins cut off their mother's head to ruin a foe." The same author states that he is "firmly persuaded that the normal condition of India has ever been to be without what Europeans understand by laws and law courts."

So far as the question is one of the propriety of language, the burden in this case is decidedly against those who would extend the phraseology of law to such rules as these. Can we with any advantage speak of one person having a right against another, when his remedy consists in starving himself in order to bring sin upon the head of his opponent or compel him to do likewise? If *dharma* or anything like it suffices to keep a community to its customary practices, is it possible to express such customs in terms applicable to the laws of European societies? Or is any harm done by saying that the difference between the two is so great that the former cannot be regarded as positive laws at all?

The true criterion in all these cases is, neglecting the shape and circumstances in which the rules in question may have appeared, to ask by which means compliance with them is enforced. Austin's theory in the end comes to this, that true laws are in all cases obeyed in consequence of the application of regulated physical force by some portion of the community. That is a fair paraphrase of the position that laws are the commands of the sovereign, and is perhaps less objectionable inasmuch as it does not imply or suggest anything about the forms in which laws are enunciated. All rules, customs, practices, and laws—or by whatever name these uniformities of human conduct may be called—have either this kind of force at their back or they have not. Is it worth while to make this difference the basis of a scientific system or not? Apparently it is. If it were a question of distinguishing between the law of the law courts and the laws of fashion no one would hesitate. Why should laws or rules having no support from any political authority be termed laws positive merely because there are no other rules in the society having such support?

The question may perhaps be summed up as follows. Austin's definitions are in strict accordance with the facts of government in civilized states; and, as it is put by Sir H. Maine, certain assumptions or postulates having been made, the great majority of Austin's positions follow as of course or by ordinary logical process. But at the other extreme end of the scale of civilization are societies to which Austin himself refuses to apply his system, and where, it would be conceded on all sides, there is neither political community nor sovereign nor law,—none of the facts which jurisprudence assumes to exist. There is an interme-

diate stage of society in which, while the rules of conduct might and generally would be spoken of as laws, it is difficult to trace the connexion between them and the sovereign authority whose existence is necessary to Austin's system. Are such societies to be thrown out of account in analytical jurisprudence, or is Austin's system to be regarded as only a partial explanation of the field of true law, and his definitions good only for the laws of a portion of the world? The true answer to this question appears to be that when the rules in any given case are habitually enforced by physical penalties, administered by a determinate person or portion of the community, they should be regarded as positive laws and the appropriate subject matter of jurisprudence. Rules which are not so enforced, but are enforced in any other way, whether by what is called public opinion, or spiritual apprehensions, or natural instinct, are rightly excluded from that subject matter. In all stages of society, savage or civilized, a large body of rules of conduct, habitually obeyed, are nevertheless not enforced by any state sanction of any kind. Austin's method assimilates such rules in primitive society, where they subserv the same purpose as positive laws in an advanced society, not to the positive laws which they resemble in purpose but to the moral or other rules which they resemble in operation. If we refuse to accept this position we must abandon the attempt to frame a general definition of law and its dependent terms, or we must content ourselves with saying that law is one thing in one state of society and another thing in another. On the ground of clearness and convenience Austin's method is, we believe, substantially right, but none the less should the student of jurisprudence be on his guard against such assumptions as that legislation is a universal phenomenon, or that the relation of sovereign and subject is discernible in all states of human society. And a careful examination of Sir Henry Maine's criticism will show that it is devoted not so much to a rectification of Austin's position as to correction of the misconceptions into which some of his disciples may have fallen. It is a misconception of the analysis to suppose that it involves a difference in juridical character between custom not yet recognized by any judicial decision and custom after such recognition. There is no such difference except in the case of what is properly called "judicial legislation"—wherein an absolutely new rule is added for the first time to the law. The recognition of a custom or law is not necessarily the beginning of the custom or law. Where a custom possesses the marks by which its legality is determined according to well understood principles, the courts pronounce it to have been law at the time of the happening of the facts as to which their jurisdiction is invoked. The fact that no previous instance of its recognition by a court of justice can be produced is not material. A lawyer before any such decision was given would nevertheless pronounce the custom to be law,—with more or less hesitation according as the marks of a legal custom were obvious or not. The character of the custom is not changed when it is for the first time enforced by a court of justice, and hence the language used by Sir Henry Maine must be understood in a very limited sense. "Until customs are enforced by courts of justice"—so he puts the position of Austin—they are merely "positive morality," rules enforced by opinion; but as soon as courts of justice enforce them they become commands of the sovereign, conveyed through the judges who are his delegates or deputies. This proposition, on Austin's theory, would only be true of customs as to which these marks were absent. It is of course true that when a rule enforced only by opinion becomes for the first time enforceable by a court of justice—which is the same thing as the first time of its being actually enforced—

its juridical character is changed. It was positive morality; it is now law. So it is when that which was before the opinion of the judge only becomes by his decision a rule enforceable by courts of justice. It was not even positive morality but the opinion of an individual; it is now law.

The most difficult of the common terms of law to define is *right*; and, as right rather than duty is the basis of classification, it is a point of some importance. Assuming the truth of the analysis above discussed, we may go on to say that in the notion of law is involved an obligation on the part of some one, or on the part of every one, to do or forbear from doing. That obligation is duty; what is right? Dropping the negative of forbearance, and taking duty to mean an obligation to do something, with the alternative of punishment in default, we find that duties are of two kinds. The thing to be done may have exclusive reference to a determinate person or class of persons, on whose motion or complaint the sovereign power will execute the punishment or sanction on delinquents; or it may have no such reference, the thing being commanded, and the punishment following on disobedience, without reference to the wish or complaint of individuals. The last are absolute duties, and the omission to do, or forbear from doing, the thing specified in the command is in general what is meant by a crime. The others are relative duties, each of them implying and relating to a right in some one else. A person has a right who may in this way set in operation the sanction provided by the state. In common thought and speech, however, right appears as something good deal more positive and definite than this,—as a power or faculty residing in individuals, and suggesting not so much the relative obligation as the advantage or enjoyment secured thereby to the person having the right. Mr J. S. Mill, in a valuable criticism of Austin, suggests that the definition should be so modified as to introduce the element of "advantage to the person exercising the right." But it is exceedingly difficult to frame a positive definition of right which shall not introduce some term at least as ambiguous as the word to be defined. Professor Holland defines right in general as a man's "capacity of influencing the acts of another by means, not of his own strength, but of some authority or power external to himself." Direct influence exercised by virtue of one's own strength, physical or otherwise, over another's acts, is "might" as distinguished from right. When the indirect influence is the opinion of society, we have a "moral right." When it is the force exercised by the sovereign, we have a legal right. It would be more easy, no doubt, to pick holes in this definition than to frame a better one.¹

The distinction between rights available against determinate persons and rights available against all the world, *jura in personam* and *jura in rem*, is of fundamental importance. The phrases are borrowed from the classical jurists, who used them originally to distinguish actions according as they were brought to enforce a personal obligation or to vindicate rights of property. The owner of property has a right to the exclusive enjoyment thereof, which avails against all and sundry, but not against one person more than another. The parties to a contract have rights available against each other, and against no other persons. The

jus in rem is the badge of property, the *jus in personam* is a mere personal claim.

That distinction in rights which appears in the division of law into the law of persons and the law of things is thus stated by Austin. There are certain rights and duties, with certain capacities and incapacities, by which persons are determined to various classes. The rights, duties, &c., are the condition or status of the person; and one person may be invested with many status or conditions. The law of persons consists of the rights, duties, &c., constituting conditions or status, the rest of the law is the law of things. The separation is a mere matter of convenience, but of convenience so great that the distinction is universal. Thus any given right may be exercised by persons belonging to innumerable classes. The person who has the right may be under twenty-one years of age, may have been born in a foreign state, may have been convicted of crime, may be a native of a particular county, or a member of a particular profession or trade, &c.; and it might very well happen, with reference to any given right, that, while persons in general, under the circumstances of the case, would enjoy it in the same way, a person belonging to any one of these classes would not. If belonging to any one of those classes makes a difference not to one right merely but to many, the class may conveniently be abstracted, and the variations in rights and duties dependent thereon may be separately treated under the law of persons. The personality recognised in the law of persons is such as modifies indefinitely the legal relations into which the individual clothed with the personality may enter. See Holland's *Elements of Jurisprudence*, p. 90.

The author last cited disapproves of the prominence given by Austin to this distinction, instead of that between public and private law. This, according to Professor Holland, is based on the public or private character of the persons with whom the right is connected, public persons being the state or its delegates. Austin, holding that the state cannot be said to have legal rights or duties, recognises no such distinction. The term "public law" he confines strictly to that portion of the law which is concerned with political conditions, and which ought not to be opposed to the rest of the law, but "ought to be inserted in the law of persons as one of the limbs or members of that supplemental department."

Lastly, following Austin, the main division of the law of things is into (1) primary rights with primary relative duties, (2) sanctioning rights with sanctioning duties (relative or absolute). The former exist, as it has been put, for their own sake, the latter for the sake of the former. Rights and duties arise from facts and events; and facts or events which are violations of rights and duties are *delicts* or *injuries*. Rights and duties which arise from delicts are remedial or sanctioning, their object being to prevent the violation of rights which do not arise from delicts.

We are inclined to agree with the view expressed by Mr F. Harrison (*Fortnightly Review*, vol. xxi), that the rearrangement of English law on the basis of a scientific classification, whether Austin's or any other, would not result in advantages at all compensating for its difficulties. If anything like a real code were to be attempted, the scientific classification would be the best; but in the absence of that, and indeed in the absence of any habit on the part of English lawyers of studying the system as a whole, the arrangement of facts does not vary much matter. It is essential, however, to the abstract study of the principles of law. Scientific arrangement might also be observed with advantage in treatises affecting to give a view of the whole law, especially those which are meant for educational rather than professional uses. The only

¹ In English speech another ambiguity is happily wanting which in many languages besets the phrase expressing "a right." The Latin "*ius*," the German "*Recht*," the Italian "*diritto*," and the French "*droit*" express, not only a right, but also law in the abstract. To indicate the distinction between "*law*" and "*a right*" the Germans are therefore obliged to resort to such phrases as "*objectives*" and "*subjectives Recht*," meaning by the former law in the abstract, and by the latter a concrete right. And Blackstone, perpetrating the distinction drawn by Roman law between the "*jus quod ad rem*" and the "*jus quod ad personam attinet*," devotes the first two volumes of his *Commentaries* to the "*Rights of Persons*" and the *Rights of Things*." See Holland's *Elements of Jurisprudence*, p. 57.

book worth naming of that kind is Blackstone's *Commentaries*, which, in the hands of successive annotators, retains all its original defects of arrangement. It has simply been brought down to date, and its last condition is, from every point of view but that, worse than its first. As an example of the practical application of a scientific system of classification to a complete body of law, we may point to Professor W. A. Hunter's elaborate *Exposition of Roman Law* (London, 1876).

It is impossible to present the conclusions of historical jurisprudence in anything like the same shape as those which we have been discussing. As yet historical jurisprudence is little more than a method, and its results are generalizations of more or less plausibility or probability. The inquiry is in that stage which is indicated in one way by describing it as a philosophy. The philosophy of the history of law is all that it can yet claim to be. It resembles, and is indeed only part of, the study which is described as the philosophy of history. Its chief interest hitherto has been in the light which it has thrown upon rules of law and legal institutions which had been and are generally contemplated as positive facts merely, without reference to their history, or have been associated historically with principles and institutions not really connected with them.

The historical treatment of law displaces some very remarkable misconceptions. Peculiarities and anomalies abound in every legal system, and, as soon as laws become the special study of a professional class, some mode of explaining or reconciling them will be resorted to. One of the prehistorical ways of philosophizing about law was to account for what wanted explanation by some theory about the origin of technical words. This implies some previous study of words and their history, and is an instance of the deep-seated and persistent tendency of the human mind to identify names with the things they represent. The *Institutes* of Justinian abound in explanations, founded on a supposed derivation of some leading term. *Testamentum*, we are told, *ex eo appellatur quod testatio mentis est*. A testament was no doubt, in effect, a declaration of intention on the part of the testator when this was written. But the *mentum* is a mere termination, and has nothing to do with *mens* at all. The history of testaments, which, it may be noticed incidentally, has been developed with conspicuous success, gives a totally different meaning to the institution from that which was expressed by this fanciful derivation. So the perplexing subject of *possession* was supposed in some way to be explained by the derivation from *pono* and *sedeo*,—*quasi sedibus positio*. *Posthumus* was supposed to be a compound of *post* and *humus*. These examples belong to the class of rationalizing derivations with which students of philosophy are familiar. Their characteristic is that they are suggested by some prominent feature of the thing as it then appeared to observers,—which feature thereupon becomes identified with the essence of the thing at all times and places.

Another prehistorical mode of explaining law may be described as metaphysical. It conceives of a rule or principle of law as existing by virtue of some more general rule or principle in the nature of things. Thus, in the English law of inheritance, until the passing of the recent Inheritance Act, an estate belonging to a deceased intestate would pass to his uncle or aunt, to the exclusion of his father or other lineal ancestor. This anomaly from an early time excited the curiosity of lawyers, and the explanation accepted in the time of Bracton was that it was an example of the general law of nature:—"Descendit itaque jus quasi pondusmodum quid cadens deorsum recta linea vel transversal, et nunquam resascendit ea via qua descendit." The author of an excellent summary of the history of the

law of real property (Mr Digby) supposes that the "rule really results from the associations involved in the word descent." It seems more likely, however, that these associations explained rather than that they suggested the rule,—that the omission of the lineal ancestor existed in custom before it was discovered to be in harmony with the law of nature. It would imply more influence than the reasoning of lawyers is likely to have exercised over the development of law at that time to believe that a purely artificial inference of this kind should have established so very remarkable a rule. However that may be, the explanation is typical of a way of looking at law which was common enough before the dawn of the historical method. Minds capable of reasoning in this way were, if possible, farther removed from the conceptions implied in the reasoning of the analytical jurists than they were from the historical method itself. In this connexion it may be noticed that the great work of Blackstone marks an era in the development of legal ideas in England. It was not merely the first, as it still remains the only, adquate attempt to expound the leading principles of the whole body of law, but it was distinctly inspired by a rationalizing method. Blackstone tried not merely to express but to illustrate legal rules, and he had a keen sense of the value of historical illustrations. He worked of course with the materials at his command. His manner and his work are obnoxious alike to the modern jurist and to the modern historian. He is accused by the one of perverting history, and by the other of confusing the law. But his scheme is a great advance on anything that had been attempted before; and, if his work has been prolific in popular fallacies, at all events it enriched English literature by a conspectus of the law, in which the logical connexion of its principles *inter se*, and its relation to historical facts, were distinctly if erroneously recognized.

While the historical method has superseded the verbal and metaphysical explanation of legal principles, it has apparently, in some cases, come into conflict with the conclusions of the analytical school. The difference between the two systems comes out most conspicuously in relation to customs. There is an unavoidable break in the analytical method between societies in which rules are backed by regulated physical force and those in which no such force exists. At what point in its development a given society passes into the condition of "an independent political society" it may not be easy to determine, for the evidence is obscure and conflicting. To the historical jurist there is no such breach. The rule which in one stage of society is a law, in another merely a rule of "positive morality," is the same thing to him throughout. By a recent Act of Parliament the Ulster custom of tenant right and other analogous customs were legalized. For the purposes of analytical jurisprudence there is no need to go beyond the Act of Parliament. The laws known as the Ulster custom are laws solely in virtue of the sovereign government. Between the law as it now is and the custom as it existed before the Act there is all the difference in the world. To the historical jurist no such separation is possible. His account of the law would not only be incomplete without embracing the precedent custom, but the Act which made the custom law is only one of the facts, and by no means the most significant or important, in the history of its development. An exactly parallel case is the legalization in England of that customary tenant right known as *coppold*. It is to the historical jurist exactly the same thing as the legalization of the Ulster tenant right. In the one case a practice was made law by formal legislation, and in the other without formal legislation. And there can be very little doubt that in an earlier stage of society, when formal legislation had not become

the rule, the custom would have been legalized relatively much sooner than it actually was.

Customs then are the same thing as laws to the historical jurist, and his business is to trace the influences under which they have grown up, flourished, and decayed, their dependence on the intellectual and moral conditions of society at different times, and their reaction upon them. The recognized science—and such it may now be considered to be—with which historical jurisprudence has most analogy is the science of language. Laws and customs are to the one what words are to the other, and each separate municipal system has its analogue in a language. Legal systems are related together like languages and dialects, and the investigation in both cases brings us back at last to the meagre and obscure records of savage custom and speech. A great master of the science of language (Max Müller) has indeed distinguished it from jurisprudence, as belonging to a totally different class of sciences. "It is perfectly true," he says, "that if language be the work of man in the same sense in which a statue, or a temple, or a poem, or a law are properly called the works of man, the science of language would have to be classed as an historical science. We should have a history of language as we have a history of art, of poetry, and of jurisprudence; but we could not claim for it a place side by side with the various branches of natural history." Whatever be the proper position of either philology or jurisprudence in relation to the natural sciences, it would not be difficult to show that laws and customs on the whole are equally independent of the efforts of individual human wills,—which appears to be what is meant by language not being the work of man. The most complete acceptance of Austin's theory that law everywhere and always is the command of the sovereign does not involve any withdrawal of laws from the domain of natural science, does not in the least interfere with the scientific study of their affinities and relationships. Max Müller elsewhere illustrates his conception of the different relation of words and laws to the individual will by the story of the emperor Tiberius, who was reproved for a grammatical mistake by Marcellus, whereupon Capito, another grammarian, observed that, if what the emperor said was not good Latin, it would soon be so. "Capito," said Marcellus, "is a liar; for, Caesar, thou canst give the Roman citizenship to men, but not to words." The mere impulse of a single mind, even that of a Roman emperor, however, probably counts for little more in law than it does in language. Even in language one powerful intellect or one influential academy may, by its own decree, give a bent to modes of speech which they would not otherwise have taken. But whether law or language be conventional or natural is really an obsolete question, and the difference between historical and natural sciences in the last result is one of names.

The application of the historical method to law has not resulted in anything like the discoveries which have made comparative philology a science. There is no Grimm's law for jurisprudence; but something has been done in that direction by the discovery of the analogous processes and principles which underlie legal systems having no external resemblance to each other. It happens, however, that the historical study of law has, for the most part, been confined to a single system—the Roman law. The Roman law presents itself to the historical student in two different aspects. It is, regarded as the law of the Roman republic and empire, a system whose history can be traced throughout a great part of its duration with certainty, and in parts with great detail. It is, moreover, a body of rationalized legal principles which may be considered apart from the state system in which they were developed, and which

have, in fact, entered into the jurisprudence of the whole of modern Europe on the strength of their own abstract authority,—so much so that the continued existence of the civil law, after the fall of the empire, is entitled to be considered one of the first discoveries of the historical method. Alike, therefore, in its original history, as the law of the Roman state, and as the source from which the fundamental principles of modern laws have been taken, the Roman law presented the most obvious and attractive subject of historical study. An immense impulse was given to the history of Roman law by the discovery of the *Institutes* of Gaius in 1816. A complete view of Roman law, as it existed three centuries and a half before Justinian, was then obtained, and as the later *Institutes* were, in point of form, a recension of those of Gaius,¹ the comparison of the two stages in legal history was at once easy and fruitful. Moreover, Gaius dealt with antiquities of the law which had become obsolete in the time of Justinian, and were passed over by him without notice. Roman law has accordingly been the main subject of historical study, and the conclusions of jurisprudence are to a great extent generalizations suggested by the history of Roman law.

Nowhere did Roman law in its modern aspect give a stronger impulse to the study of legal history than in Germany. The historical school of German jurists led the reaction of national sentiment against the proposals for a general code made by Thibaut. They were accused by their opponents of setting up the law of past times as intrinsically entitled to be observed, and they were no doubt strongly inspired by reverence for customs and traditions. Through the examination of their own customary laws, and through the elimination and separate study of the Roman element therein, they were led to form general views of the history of legal principles. In the hands of Savigny, the greatest master of the school, the historical theory was developed into a universal philosophy of law, covering the ground which we should assign separately to jurisprudence, analytical and historical, and to theories of legislation. There is not in Savigny's system the faintest approach to the Austinian analysis. The range of it is not the analysis of law as a command, but that of a *Rechtsverhältnis* or legal relation. Far from regarding law as the creation of the will of individuals, he maintains it to be the natural outcome of the consciousness of the people, like their social habits or their language. And he assimilates changes in law to changes in language. "As in the life of individual men no moment of complete stillness is experienced, but a constant organic development, such also is the case in the life of nations, and in every individual element in which this collective life consists; so we find in language a constant formation and development, and in the same way in law."² German jurisprudence is darkened by metaphysical thought, and weakened, as we believe, by defective analysis of positive law. But its conception of laws is exceedingly favourable to the growth of an historical philosophy, the results of which have a value of their own, apart altogether from the character of the first principles. Such, for instance, is Savigny's famous examination of the law of possession.

There is only one other system of law which is worthy of being placed by the side of Roman law, and that is the law of England. No other European system can be compared with that which is the origin and substratum of them all; but England, as it happens, is isolated

¹ A very useful edition of the *Institutes* of Justinian, printed as a recension of the text of Gaius, has been published by Professor T. B. Holland, Oxford, Clarendon Press, 1885, 2d ed.

² See *Introduction to the History of Jurisprudence*, by Dr. O. Guhlfield Eisen, LL.D., London, 1880.

in jurisprudence. She has solved her legal problems for herself. Whatever element of Roman law may exist in the English system has come in, whether by conscious adaptation or otherwise, *ab extra*; it is not of the essence of the system, nor does it form a large portion of the system. And, while English law is thus historically independent of Roman law, it is in all respects worthy of being associated with it on its own merits. Its originality, or, if the phrase be preferred, its peculiarity, is not more remarkable than the intellectual qualities which have gone to its formation—the ingenuity, the rigid logic, the reasonableness, of the generations of lawyers and judges who have built it up. This may seem extravagant praise for a legal system, the faults of which are and always have been matter of daily complaint, but it would be endorsed by all unprejudiced students. What men complain of is the practical hardship and inconvenience of some rule or process of law. They know, for example, that the law of real property is exceedingly complicated, and that, among other things, it makes the conveyance of land expensive. But the technical law of real property, which rests to this day on ideas that have been buried for centuries, has nevertheless the qualities we have named. So too with the law of procedure as it existed under the "science" of special pleading. The greatest practical law reformer, and the severest critic of existing systems that has ever appeared in any age or country, Jeremy Bentham, has admitted this:—"Confused, indeterminate, inadequate, ill-adapted, and inconsistent as to a vast extent the provision or no provision would be found to be that has been made by it for the various cases that have happened to present themselves for decision, yet in the character of a repository of such cases it affords, for the manufactory of real law, a stock of materials which is beyond all price. Traverse the whole continent of Europe, ransack all the libraries belonging to all the jurisprudential systems of the several political states, add the contents together, you would not be able to compose a collection of cases equal in variety, in amplitude, in clearness of statement—in a word, all points taken together, in constructiveness—to that which may be seen to be afforded by the collection of English reports of adjudged cases" (Bentham's *Works*, vol. 17 p. 460). On the other hand, the fortunes of English jurisprudence are not unworthy of comparison even with the catholic position of Roman law. In the United States of America, in India, and in the vast colonial empire, the common law of England constitutes most of the legal system in actual use, or is gradually being superimposed upon it. It would hardly be too much to say that English law of indigenous growth, and Roman law, between them govern the legal relations of the whole civilized world. Nor has the influence of the former on the intellectual habits and the ideas of men been much if at all inferior. Those who set any store by the analytical jurisprudence of the school of Austin will be glad to acknowledge that it is pure outcome of English law. Sir Henry Maine has associated its rise with the activity of modern legislatures, which is of course a characteristic of the societies in which English laws prevail. And it would not be difficult to show that the germs of Austin's principles are to be found in legal writers who never dreamed of analyzing a law. It is certainly remarkable, at all events, that the acceptance of Austin's system is as yet confined strictly to the domain of English law. Sir H. Maine has found no trace of its being even known to the jurists of the Continent, and it would appear that it has been equally without influence in Scotland, which, like the Continent, is essentially Roman in the fundamental elements of its jurisprudence.

While, however, Roman law has had many historians, and while it has been, in Germany at least, the subject of

a good deal of historical philosophy, English law can hardly yet be said to have had its historian, much less its philosopher. What is wanted here, in the first place, is the setting forth of the materials in a condition fit for examination. This has been rightly described as perhaps the most important intellectual want of the present time. But in the meantime the revival of the study of Roman law in England has made the comparison of Roman and English law a matter of course in legal education, and has undoubtedly led, in accordance, no doubt, with the bent of contemporary thought, to the formation in England of what may not improperly be called a great school of historical jurists.

By far the most considerable contribution made by England to historical jurisprudence is the writings of Sir Henry Maine. The first of these (*Ancient Law*), published in 1861, has probably had a more profound influence on contemporary thought than any other book of this generation. *The Early History of Institutions and Village Communities in the East and West* have since followed. In *Ancient Law* Sir Henry Maine proposes to trace the connexion of the subject with the early history of society and its relation to modern ideas. Taking the Roman law as a typical system, he revealed for the first time to English readers the connexion between the principles of forgotten laws and, not merely the legal ideas, but the moral common-places of our own time. The book undermined what had been accepted as first principles by showing that they had a history. It gratified the intellectual sense by the brilliant identification of legal ideas, obscured by difference of time and place and circumstance. It is not surprising that its influence has been even more extensive among educated laymen than among professional lawyers, for the latter are condemned by custom to disregard everything in their science but its relation to the business of the day. But *Ancient Law* set the attitude of regarding a legal rule not as an isolated fact but as the last link in an historical series. In the better sort of legal text-books which have recently appeared the attitude is discernible, and on the whole to the advantage of the exposition, even for the purposes of practice.

At the present moment conclusions based on an examination of the history of legal systems stand subject to correction by the results of the investigation, which is being conducted with so much diligence and success, into the condition of savage races. If it be a right inference that the phenomena of barbarism, as it exists at the present day, represent a condition through which civilized societies have passed, it is obvious that the origin which recorded history suggests for legal ideas and practices must not be taken as absolute. It so happens that prehistoric society has hitherto engaged a much larger share of attention than the history of laws. Conspicuous among the writers who have made important contributions to the literature of this subject are Mr R. B. Tylor, Sir J. Lubbock, Mr Lewis Morgan, and especially Mr J. F. M'Lennan. Many of the conclusions to which these inquirers have been led do not affect any position taken up by historical jurists, but others tend to show that social forms which, seen from the side of legal history, appeared to be the absolute beginning of modern institutions, may themselves have been the result of a long evolution. The most conspicuous example, not of antagonism, but of what may be called disconnection, between juridical and naturalistic theories of the origin of society, is to be found in the FAMILY (*q.v.*). Here it need only be said that the part played by the family in the development of legal ideas has been fully elaborated by historical jurists, sometimes with the inference, implied rather than expressed, that it marks the beginning of the history, or at least is to be found in the earliest period of the race of which we have

trustworthy evidence. Substantially the conclusions of the jurists as to the influence of the conception of the family on historic law remain unimpaired. It is true that a great part of the "legal ideas of civilized races may be traced to this conception, and that the history of their development is the history of its slow unwinding."¹ But that there is no anterior condition to that in which the patriarchal family—"a group of men, women, and slaves, of animate and inanimate property, all connected together by subjection to the paternal power of the chief of the household"—is the unit of society, is not, so far as we are aware, affirmed by any historical jurist. The evidences on that question will be found in the article FAMILY above mentioned.

Another natural group whose place in legal history has recently been the subject of careful investigation is the village community. In one of its forms—the township—"it is an organized self-acting group of Teutonic families, exercising a common proprietorship over a definite tract of land, its mark, cultivating its domain on a common system, and sustaining itself by the produce. It is described by Tacitus in the *Germania* as the *vicius*; it is well known to have been the proprietary and even the political unit of the earliest English society, it is allowed to have existed among the Scandinavian races, and it survived to so late a date in the Orkney and Shetland islands as to have attracted the attention of Sir Walter Scott" (Maine, *Village Communities*, p. 10). Founding on the researches of G. L. von Maurer, of Nasse, and others on the Teutonic mark, and comparing them with the observed phenomena of the village community in India, Sir H. Maine has shown, in the work just cited, how this widely diffused institution illustrates legal history, more particularly with reference to property in land, and to the conservation of customary law.

The lateness of the intervention of the state or sovereign as a direct legislator has been adverted to in the previous discussion. Formal law-making by the state is everywhere posterior to its intervention as the enforcer of law. Not that law-making was consciously separated from judging, or that the assembly or officer who represented the state was conceived as exclusively judicial. But the state, whether represented by a public assembly or by an officer, undertook to decide disputes between man and man long before it presumed to say on what principle such disputes should be decided. The judge everywhere comes before the legislator, if indeed terms so purely modern can be applied without danger to early law. That the pronouncements of the judge were themselves a source of law,—that he created the law which he professed to declare,—is true in a sense which, however, requires us to obliterate the most conspicuous of all the duties of a judge conceived in relation to mature law. That the law existed before the judgment, that the judgment should simply declare pre-existing law, that *ex post facto* laws are unjust—are the inveterate beliefs and prejudices of a civilized society, the strength of which is manifested by the fictions elsewhere noticed as concealing the manufacture of new law. No such conception is to be imported into the notions of early society as to the right and wrong of civil justice. The office of the judge was to settle disputes, to do right where wrong had been done; and whether his decision was founded on law, or custom, or religion, or on personal wisdom or inspiration, was a question which we cannot conceive as being asked, when these things were not distinguished in thought.

A conclusion suggested by the earliest forms of procedure in Roman law is that the intervention of the judge is originally that of a private arbitrator. The *legis actio sacramenti* retained down to a very late period certain

symbolical proceedings, in which the features of a private quarrel were simulated. It was a petrified legal drama, like that played by the vouchers in the English action of assumpsit. The parties wrangle over the disputed property, the magistrate interposes, and they agree to abide by his decision, each staking a deposit on the justice of his case. Maine felicitously compares these formalities with the trial scene depicted on the shield of Achilles in the *Iliad*, in which the *sacramentum* is represented by two talents of gold to go to the judge who shall best decide the points in dispute in the opinion of the spectators. The reward given to the private arbitrator has become in legal symbolism the fee payable to the court on the hearing of the cause. "In confirmation of this view," says Maine, "it may be added that many observers of the oldest judicial usages of modern Europe have remarked that the fines inflicted by courts on offenders were originally *sacramenta*" (*Ancient Law*, p. 376). The symbolism of another *legis actio* is susceptible of a similar interpretation. The *condictio* was a personal action taking its name from the notification to the defendant to appear before the judge on a day named, and it simulated a quarrel settled, not by the interposition of the arbitrator, but by agreement of the parties in the form of a wager, to be decided by the arbitrator at a future time. It is consistent with this view of the first manifestations of judicial functions that early as compared with mature law should assign so large a place to mere procedure. The adjective law, as it is now called, was the first portion of the law to take definite shape, and long maintained its place in the foreground of the system. When a special class in society, whether an aristocratic or priestly caste or a profession, became, as was almost universally the case, the exclusive custodians of the law, the formalities of procedure were their most important secrets. It is represented as a revolution in Roman society when the clerk of one of the aristocratic lawfirms divulged to the public his master's notes for the conduct of legal proceedings. And at all times, it may be said, the law of procedure or practice is in a special sense the law of the professional lawyer, his knowledge of which makes him a skilled craftsman.

The more definite the judiciary power the more do we approach the state of things in which the postulates of analytical jurisprudence are true. Another mark of maturing law is its expression in writing, which, while it destroys the secret monopoly of a class, tends to develop the separate profession of free practising lawyers, who in all progressive societies count as the most powerful instrument for moulding the shape of the law. The influence of lawyers upon law is one of the topics on which the comparison of English and Roman law throws a flood of light, but its illustration would carry us beyond our present limits. Nor can we do more than allude to the importance tentatively assigned by Maine to the question whether a written law comes relatively early or late in the history of a nation. He appears to hold that the relatively early code of the Romans saved them from that degeneration of custom which takes place when it is transmitted by oral tradition from one generation to another.

We have discussed elsewhere, under the headings *Equity* and *FRONTS*, two of the modes by which legal changes have been brought about indirectly. Direct law-making by the sovereign power, there is reason to believe, is not only everywhere later than these agencies, but its activity is progressive, and constantly tends to displace them. A glance at the English statute-book will show that the legislature at the present day undertakes the deliberate alteration of the law to a much greater extent than it has ever done before. A rough illustration is the fact that the chronological table of the statutes from 1235 to 1877

¹ Maine's *Village Communities*, p. 16.

covers over three hundred pages, of which fully two-thirds are occupied with the legislation of the last hundred years. This activity varies of course at different times, and the variations even in recent times have been remarkable. And, large as are the contributions of modern parliaments to the law, it is notorious that but for defects in the legislative machinery they would be much larger. Nor is this activity to be accounted for by the theory that the domain of law is more intrusive than in earlier times. There has undoubtedly been within the last generation a steady increase in the control asserted by the state over the habits of its citizens, for some account of which reference may be made to the article GOVERNMENT. But on the whole the range of action with which the English law declines to interfere is probably as great now as it ever has been in civilized societies. The true explanation is that parliament has effectively secured for itself exclusive authority as the source of legal changes. The violent assault of Bentham on judiciary law was but the echo of the lesson taught by the English judges as to omnipotence of parliament, and thoroughly understood and accepted by popular opinion. To that is due the caution, not to say timidity, which now characterizes the judicial interpretation of statutes. The courts adhere to the literal meaning of the enactment unless compelled to open it by its too frequent absurdity or self-contradiction. If there is any way out of a difficulty which will not involve the slightest addition to the enacted law, that will be the way followed by judicial decision. This attitude is a complete reversal of that which once prevailed in the courts, when the law embodied in decided cases, pure drawn from the fountains of justice, was deemed superior in dignity to the enactments of an unlearned parliament. The tribunals, in so far as they now make law, operate much more freely on the cases than on the statutes.

The consequence of this relation of the judiciary and the legislature is that, while great reforms are no doubt accelerated, small reforms have to wait. Parliament does in a single session that which would have taken ages to accomplish under the natural agencies of equity and fiction, and much which would never have been brought about by these agencies at all. But the capacity of parliament is limited, and so is its foresight. The work of legislation is left incomplete, and the judiciary carefully avoids completing it, leaving the legislature to take it up again when it may. An instance in point is the late history of the law of evidence. This portion of the law grew to maturity in the courts, whose creation it was. It has been wholly transformed by direct legislative enactment (under the influence of Benthamite principles), Act after Act being passed as occasion pointed out defects in what had already been accomplished. One of the latest Acts on the subject simply enables parties and their husbands or wives to give evidence in a certain class of indictments. The substitution of an affirmation for an oath has been carried out in the same piecemeal fashion, the courts refraining from developing the principle of the amendments, as they would have done if the movement had originated with themselves and in an earlier stage of their history. The most portentous example of the intervention of the legislature to complete the exact details of its enactments is the Act previously noticed, which orders the word "this" to be interpreted as "that." The defects of existing legislative methods in England result in some defects in the form of the law, which the tribunals are free to criticize but not to correct. An Act of Parliament bears upon its face the marks of the tumultuous discussion of a large popular assembly, and of the compromise which reconciles the opposing views of the two Houses. Very few Acts, no matter what care may be employed in framing them, are

promulgated in the form best suited for actual exercise,—in the form which would be given to them by an intelligent legislator, charged with the expression of the principle which parliament is supposed to have sanctioned.

In what has been said regarding the relations of the legislature and the judiciary it is not implied that the manufacture of case-law by the latter has ceased. On the contrary, it goes on with yearly increasing volume, and the immense accumulation of decided cases is one of the evils of the present state of the law. The hand of precedent never lay heavier on the conscience of the judge than it does now. The necessary literature of the law is increased by a dozen large volumes every year. The law becomes more voluminous without becoming more elastic or more systematic. The stereotyped judicial habit is to follow absolutely the precedents set by every tribunal of higher rank, and almost absolutely those set by tribunals of co-ordinate rank. A careful semi-official record has taken the place of the private reports published by lawyers privileged by the courts to take notes of their proceedings. Every case of any importance is recorded and becomes a precedent which the practising lawyer in future must know, and which the judge must follow. The minute detail into which legal literature is thus made to descend is becoming an intolerable load; and it is a question whether some revolution in respect to precedents is not becoming necessary.

Legislation by judges has its counterpart in the use of legislative forms for judicial purposes. Long after legislative and judicial functions have been separated, we find legislative acts serving the purpose of judicial decisions. The history of English law is full of examples, the best known of which is that of divorce. The practice of passing private bills of divorce, at a time when the technical law did not allow of that remedy, hardened into a purely judicial practice. The Act which established the Divorce Court did not in effect do more than create a new and better tribunal. So with the General Enclosure Act, which took over from the legislature the purely judicial work of sanctioning enclosures in proper cases.

Comparative jurisprudence, in the sense in which it is distinguishable from historical jurisprudence, can scarcely be said as yet to have a separate existence. Since Leibnitz projected his youthful scheme for tabulating the laws of all the countries of the world, and exhibiting their correspondence and differences by parallel columns, little or nothing has been done for the comparison of laws except in connexion with history. One special line of study does indeed use what may be called a comparative method. The "conflict of laws" involves at least a contrast of a vast number of important points in which the laws of different nations disagree. The object of the study of this conflict is of the practical kind which comparative jurisprudence as here conceived is meant to subserve. It is to develop some *rationale* of decisions where two or more discordant rules claim exclusive application to the case. There are circumstances which seem to show that the mere comparison of laws with no other object but that of discovering in how many ways the same thing can be done, and which way is the best, will enter more and more into the higher legal studies. For one thing, the vast increase which has taken place in the means of communication between nations has made a knowledge of each other's laws a matter of imperative necessity, and has broken down, at least as between the most advanced nations, that barrier of insularity which formerly shut out all suggestions of improvement from abroad. We have already emphasized the marked extent to which this exclusiveness has characterized English law, and we cannot but regard it as typical of a new temper that in preparing for the solution of important problems of

legislation, the British Government not unfrequently collects from its agents abroad information as to the solution of the same problems in other countries. An important influence always tending in this direction, and greatly strengthened by the changes to which we have alluded, is that of commerce, and particularly of British commerce. England's business relations are coextensive with the world; it is a necessity of her business that she

should know what view is taken of contracts and the relations arising out of them by the laws of different states. And it is becoming a necessity of the commercial class in all countries that, on fundamental points at least, the principles of law should be everywhere the same. Strenuous efforts, for instance, are now being made for the establishment of a uniform law of negotiable instruments in all countries, and with some prospect of success. (E. A.)

LAW, JOHN (1671-1729), best known as the originator of what is usually called the Mississippi scheme, was born at Edinburgh in April 1671. His father, a goldsmith and what we should now describe as banker, bought shortly before his death, which took place in his son's youth, the lands of Lauriston near Edinburgh. John lived at home till he was twenty, and then went to London. He had already studied mathematics, and the theory of commerce and political economy, with much interest, but he was known rather as a fop than as a scholar. In London he gambled, drank, and flirted till in April 1694 a love intrigue resulted in a duel. He killed his antagonist, and was arrested, tried, found guilty, and condemned to death. His life was spared, but he was detained in prison. He found means to escape, and fled to Holland, then the greatest commercial country in Europe. Here he observed with close attention the practical working of banking and financial business, and conceived the first ideas of his celebrated "system." After a few years spent in foreign travel, he returned to Scotland, then exhausted and enraged by the failure of the Darien expedition (1695-1701). He propounded plans for the relief of his country in a work¹ entitled *Money and Trade Considered, with a Proposal for Supplying the Nation with Money* (1705). This attracted some notice, but had no practical effect, and Law again betook himself to wandering over the Continent. He visited Brussels, Paris, Vienna, Genoa, Rome, making large sums by gambling and speculation, and spending them in a lavish and reckless manner. He was in Paris in 1703, and made some proposals to the Government as to their financial difficulties, but Louis XIV. declined to treat with a "Huguenot," and D'Argenson, chief of the police, had him expelled the city as a suspicious character. He had, however, become intimately acquainted with the duke of Orleans, and, when in 1716 the king died, and that prince became regent, Law at once returned to the French capital. The extravagant expenditure of the late monarch had plunged the kingdom into apparently inextricable financial confusion. The debt was 3 milliard livres, the estimated annual expenditure, exclusive of interest payments, 148 million livres, and the income about the same.

The advisability of declaring a national bankruptcy was seriously discussed, and though this plan was rejected measures hardly less violent were resorted to. By a vote, or examination of the state liabilities by a committee with

full powers of quashing claims, the debt was reduced nearly a half, the coin in circulation was ordered to be called in and reissued at the rate of 120 for 100,—a measure by which foreign coiners profited greatly; and a chamber of justice was established to punish speculators, to whom the difficulties of the state were ascribed. These measures had so little success that the *billets d'état* which were issued as part security for the new debt at once sank 75 per cent. below their nominal value. At this crisis Law came forward and unfolded a vast scheme to the perplexed regent. A royal bank was to be founded. It was to manage the trade and currency of the kingdom, to collect the taxes, and free the country from debt. The council of finance then under the duke of Noailles, opposed the plan, but the regent allowed Law to go on with part of it in a tentative way. By an edict of 2d May 1716, a private institution called *La Banque Générale*, and managed by Law, was founded. The capital was 6 million livres, divided into 1200 shares of 5000 livres, payable in four instalments, one-fourth in cash, three-fourths in *billets d'état*. It was to perform the ordinary functions of a bank, and had power to issue notes payable at sight in the weight and value of the money mentioned at day of issue. The bank was a great and immediate success. By providing for the absorption of part of the state paper it raised to some extent the credit of the Government. The notes were a most desirable medium of exchange, for they had the element of fixity of value, which, owing to the arbitrary mint decrees of the Government, wanting in the coin of the realm. They were also found the most convenient instruments of remittance between the capital and the provinces, and they thus developed and increased the industries of the latter. The rate of interest, previously enormous and uncertain, fell first to 6 and then to 4 per cent.; and when another decree (10th April 1717) ordered collectors of taxes to receive notes as payment, and to change them for coin at request, the bank so rose in favour that it had soon a note issue of 60 million livres. Law now gained the full confidence of the regent, and was allowed to proceed with the development of the "system."

The trade of the large and fertile region in North America about the Mississippi had been granted to a speculator named Crozat. He found the undertaking too large, and was glad to give it up. By a decree of August 1717 Law was allowed to establish the *Compagnie des Indes-Occidentales*, and to endow it with privileges practically amounting to sovereignty over the most fertile region of North America. The capital was 100 millions, divided into 200,000 shares of 500 livres. The payments were to be one-fourth in coin and three-fourths in *billets d'état*. On these last the Government was to pay 3 millions livres interest yearly to the company. As the state paper was depreciated the shares fell much below par. The rapid rise of Law had made him many enemies, and they took advantage of this to attack the system. D'Argenson, the former chief of the police, and now, in succession to De Noailles, head of the council of finance, with the brothers Parie of Grenoble, famous tax farmers of the day, formed what was called the "anti-system." The farming of the

¹ A work entitled *Proposals and Reasons for constituting a Council of Trade in Scotland* was published anonymously at Edinburgh in 1701. It was republished at Glasgow in 1761 with Law's name attached; but several references in the state papers of the time mention William Paterson (1668-1719), founder of the Bank of England, as the author of the plan therein propounded. Even if Law had nothing to do with the composition of the work, he must have read it and been influenced by it. This may explain how it contains the germs of many of the developments of the "system." Certainly the suggestion contained in the pamphlet of a central board, to manage great commercial undertakings, to furnish occupation for the poor, to encourage mining, fishing, and manufactures, and to bring about a reduction in the rate of interest, is a plan which was to no inconsiderable extent actually realized in the Mississippi scheme. See Baillie's *Life of William Paterson* (ed. 1858), and *Writings of William Paterson* (2d ed., 3 vols., 1869).

taxes was let to them, under an assumed name, for 48½ million livres yearly. A company was formed the exact counterpart of the Mississippi company. The capital was the same, divided in the same manner, but the payments were to be entirely in money. The returns from the public revenue were sure; those from the Mississippi scheme were not. Hence the shares of the latter were for some time out of favour. Law proceeded unmoved with the development of his plans. On the 4th December 1718 the bank became a Government institution under the name of *La Banque Royale*. Law was director, and the king guaranteed the notes. The shareholders were repaid in coin, and, to widen the influence of the new institution, the transport of money between towns where it had branches was forbidden. The paper issue now reached 110 millions. Law had such confidence in the success of his plans that he agreed to take over shares in the Mississippi company at par at a near date. The shares began rapidly to rise. The next move was to unite the companies *Des Indes Orientales* and *De Chine*, founded in 1664 and 1713 respectively, but now dwindled away to a shadow, to his company. The united association was called *La Compagnie des Indes*; it had practically the monopoly of the foreign trade of France. These proceedings necessitated the creation of new capital to the nominal amount of 25 million livres. The payment was spread over 20 months. It required four of the old shares and a premium of 50 livres to obtain a new one. All these 500 livre shares rapidly rose to 750, or 50 per cent. above par. Law now turned his attention to the obtaining of additional powers within France itself. On the 25th July 1719 an edict was issued granting the company for nine years the management of the mint and the coin issue. For this privilege the company paid 5 million livres, and the money was raised by a new issue of shares of the nominal value of 500 livres, but with a premium of other 500. The list was only open for twenty days, and five of the former shares were required to obtain a new one. At the same time two dividends per annum of 6 per cent. each were promised. Again there was an attempt to ruin the bank by the commonplace expedient of making a run on it for coin, but the conspirators had to meet absolute power managed with fearlessness and skill. An edict appeared reducing, at a given date, the value of money, and those who had withdrawn coin from the bank hastened again to exchange it for the more stable notes. Public confidence in Law was increased, and he was enabled rapidly to proceed with the completion of the system. A decree of 27th August 1719 deprived the rival company of the farming of the revenue, and gave it to the *Compagnie des Indes* for nine years in return for an annual payment of 62 million livres. Thus at one blow the anti-system was crushed. One thing yet remained; Law proposed to take over the national debt, and manage it on terms advantageous to the state. The mode of transfer was this. The debt was over 1600 million livres. Notes were to be issued to that amount, and with these the state creditors were to be paid in a certain order. Shares were to be issued at intervals corresponding to the payments, and it was expected that the notes would be used in buying these. The Government was to pay 3 per cent. for the loan. It had formerly been bound to pay 80 millions, it would now pay under 50, a clear gain of over 30. As the shares of the company were almost the only medium for investment, the transfer would be surely effected. The creditors would now look to the Government payments and the commercial gains of the company for their annual returns. Indeed the creditors were often not able to procure the shares, for each succeeding issue was immediately seized upon. The third, on the 2d October, for 600 millions, divided into shares of

(with premium) 5000 livres each, was taken up as eagerly as its predecessors, and the shares immediately rose to 8000 livres in the Rue Quincampoix, then used as a bourse. They went on rapidly rising as new privileges were still granted to the company. Law had now more than regal power. The exiled Stuarts paid court to him, the proudest aristocracy in Europe humbled themselves before him; and his liberality made him the idol of the populace. After, as a necessary preliminary, becoming a Catholic, he was made controller-general of the finances in place of D'Argenson, who was removed to make way for him. Finally, in February 1720, the bank was in name as well as in reality united to the company.

The system was now complete; but it had already begun to decay. In December 1719 it was at its height. The shares then had mounted to 20,000 livres, forty times their nominal price. A sort of madness possessed the nation. Men sold their all, and hastened to Paris to speculate. The population of the capital was increased by an enormous influx of provincials and foreigners. Trade received a vast though unnatural impulse. Everybody seemed to be getting richer, no one poorer. Those who could still reflect saw that this prosperity was not real. The whole issue of shares at the extreme market price valued 12 milliard livres. It would require 500 million annual revenue to give a 6 per cent. dividend on this. Now, the whole income of the company as yet was hardly sufficient to pay 5 per cent. on the original capital of 1 milliard 677 million livres. The receipts from the taxes, &c., could be precisely calculated, and it would be many years before the commercial undertakings of the company—with which only some trifling beginning had been made—would yield any considerable return. People began to sell their shares, and to buy coin, houses, land,—anything that had a stable element of value in it. There was a rapid fall in the shares, a rapid rise in all kinds of property, and consequently a rapid depreciation of the paper money. Law met these new tendencies by a succession of the most violent edicts. The notes were to bear a premium over specie. Coin was only to be used in small payments, and only a small amount was to be kept in the possession of private parties. The use of diamonds, the fabrication of gold and silver plate, was forbidden. A dividend of 40 per cent. on the original capital was promised. By several ingenious but fallaciously reasoned pamphlets Law endeavoured to restore public confidence. The shares still fell. At last, on the 5th March, an edict appeared fixing the price of these at 9000 livres, and ordering the bank to buy and sell them at that price. The fall now was transferred to the notes, of which there were soon over 2½ milliard livres in circulation. A large proportion of the coined money was removed from the kingdom. Prices rose enormously. There was everywhere distress and complete financial confusion. Law became an object of popular hatred. He lost his court influence, and was obliged to consent to a decree (21st May 1720) by which the notes and consequently the shares were reduced to half their nominal value. This created such a commotion that its promoters were forced to recall it, but the mischief was done. What confidence could there be in the depreciated paper after such a measure? Law was removed from his office, and his enemies proceeded to demolish the system. A vast number of shares had been deposited in the bank. These were destroyed. The notes were reconverted into Government debt, but there was first a *vis* which reduced that debt to the same size as before it was taken over by the company. The rate of interest was lowered, and the Government now only pledged itself to pay 37 instead of 80 millions annually. Finally the bank was abolished, and the company reduced to a mere trading association. By November the system had disappeared. With these last

measures Law, it may well be believed, had nothing to do. He left France secretly in December 1720, resumed his wandering life, and died at Venice, poor and forgotten, 21st March 1729.

Of Law's writings the most important for the comprehension of the "system" is his *Money and Trade Considered*. In this work he says that national power and wealth consist in numbers of people, and magazines of home and foreign goods. These depend on trade, and that on money, of which a greater quantity employs more people; but credit, if the credit have a circulation, has all the beneficial effects of money. To create and increase instruments of credit is the function of a bank. Let such be created then, and let its notes be only given in return for land sold or pledged. Such a currency would supply the nation with abundance of money, and it would have many advantages, which Law points out in detail, over silver. The bank or commission was to be a Government institution, and its profits were to be spent in encouraging the export and manufacture of the nation. A very evident error lies at the root of the system. Money is not the result but the cause of wealth, he thought. To increase it then must be beneficial, and the best way is by a properly secured paper currency. This is the motive force, but it is to be applied in a particular way. Law had a profound belief in the omnipotence of Government. He saw the evils of minor monopolies, and of private farming of taxes. He proposed to centre foreign trade and internal finance in one huge monopoly managed by the state for the people, and carrying on business through a plentiful supply of paper money. He did not see that trade and commerce are best left to private enterprise, and that such a scheme would simply result in the profits of speculators and favourites. The system indeed was never so far developed as to exhibit its inherent faults. We have already seen how the madness of speculators ruined the plan when only its foundations were laid. One part indeed might have been saved. The bank was not necessarily bound to the company, and had its note issue been intended it might have become a mere bank of issue. As it thus came into the effect of 5th March 1720, which made the shares convertible into notes, ruined the bank without saving the company. The shares had risen to an unnatural height, and they should have been allowed to fall to their natural level. Perhaps Law felt this to be impossible. He had the errors of his time, but his writings show that he first perceived the errors as to the nature of currency and banking then unknown to his contemporaries. The marvellous skill which he displayed in adapting the theory of the system to the actual condition of things in France, and in carrying out the various financial transactions rendered necessary by its development, is absolutely without parallel. His profound self-confidence and belief in the truth of his own theories were the reasons alike of his success and his ruin. He never hesitated to employ the whole force of a despotic Government for the definite ends which he saw before him. He was not self-seeking. He left France poorer than he entered it, nor was he perceptibly changed by his sudden transference of fortune. Montesquieu visited him at Venice after his fall, and has left a description of him not without a certain touch of pathos. Law, he tells us, was still the same in character, perpetually planning and scheming, and, though in poverty, reviving vast projects to restore himself to power, and France to commercial prosperity.

The best account of the *Mississippi* scheme is that of Thiers, "Law et son système des Finances," first published in the *Biographie universelle*, Paris, 1820; there is an American edition, York, 1825. See also *Thiers, Histoire du Système, Munich, 1833*, & *Levasseur, Recherches historiques sur le système de Law, Paris, 1864*, and *Jobert, Un projet ou socialisme, et le système de Law et la chute des capitalistes*, Paris, 1864. Full bibliographical details are given in *Wood's Life of Law*, Edinburgh, 1884. All Law's later writings are to be found in *De la Collection des ouvrages posthumes de Law*, vol. 1, Paris, 1845. (G. W. A.)

LAW, WILLIAM (1656-1761). The events of the life of this remarkable man may be very briefly stated. He was born in 1656 at King's Cliffe; in 1705 he entered as a sizar at Emmanuel College, Cambridge; in 1711 he was elected fellow of his college and received holy orders, and in 1712 he took his M.A. degree. He resided at Cambridge, taking pupils and occasional duty until the accession of George I., when his conscience forbade him to take the oath of allegiance to the new Government and of abjuration of the Stuarts; his staunch Jacobitism had already been betrayed in a tripos speech which brought him into trouble; and he was now deprived of his fellowship, and became a non-juror. For the next few years he is said to have been a curate in London, but the point is doubtful. In 1727 we find him domiciled at Putney as tutor to Edward Gibbon,

father of the historian, and "the much honoured friend and spiritual director of the whole family" (Gibbon, *The Memoirs of my Life and Writings*). In the same year he accompanied his pupil to Cambridge, and resided with him as governor, in term time, for the next four years. His pupil then went abroad, but Law was left at Putney, where he remained in Mr Gibbon's house for more than ten years, acting as a religious guide not only to the family but to a number of pious men who used to make pilgrimages to consult the Putney sage. The most eminent of these were the two brothers John and Charles Wesley, Dr Byrom the poet, Dr Chaynes the famous physician, and Mr Archibald Hutcheson, M.P. for Hastings. In 1737 Mr Gibbon the elder died, and the household was, a short time afterwards, dispersed. Law therefore was parted from his friends, leaving behind him, the historian tells us, "in our family the reputation of a worthy and pious man, who believed all that he professed, and practised all that he enjoyed."

In 1740 Law retired to his native village, where he had inherited from his father a house and a small property. There he was presently joined by two ladies, Mrs Hutcheson, the rich widow of his old friend, who recommended her on his death-bed to place herself under Law's spiritual guidance, and Miss Hester Gibbon, sister to his late pupil. This curious trio lived for twenty-one years a life wholly given to devotion and charity, until the death of Law in 1761.

Such was the singularly uneventful life of this good man; but during the whole period from the time when he became a non-juror almost to the day of his death he was busily engaged in literary work which places him in the very first rank of 18th century divines. As a writer, it will be convenient to consider him under three heads.

1. As a singularly able controversialist. The first of his controversial works was *Three Letters to the Bishop of Bangor* (1717), which were considered both by friend and foe as one of the most powerful contributions to the Bangorian controversy on the High Church side. Dean (afterwards Bishop) Sherlock declared that "Mr Law was a writer so considerable that he knew but one good reason why his lordship did not answer him." Law's next controversial work was *Remarks on Montaigne's Fable of the Bees* (1728), in which he vindicated morality on the highest grounds; for pure style, sound wit, and lucid argument this is a perfect gem; it was enthusiastically praised by John Sterling, and has been republished by F. D. Maurice. Law's *Case of Reason* (1732), in answer to Tisdal's *Christianity as sold as the Creation* is to a great extent an anticipation of Bishop Butler's famous argument in the *Analogy*. In this work Law shows himself at least the equal of the ablest champion of Deism. His *Letters to a Lady* (written to enter the Church of Rome are excellent specimens of the attitude which a High-Churchman maintains against Romanism.

2. As a very effective writer on practical divinity. The *Serious Call to a Devout and Holy Life* (1726), together with its preface, *A Treatise of Christian Perfection* (1726), deeply influenced the chief actors in the great Evangelical revival. The Wesleys, Whitefield, Venn, Scott, and Adam all express their deep obligation to the author. The *Serious Call* affected others quite as deeply. Dr Johnson, Gibbon, Lord Lyttelton, and Bishop Horne all speak enthusiastically of its merits, and it has been, unfortunately, perhaps the only work by which its author was popularly known. In a tract entitled *The Absolute Unlawfulness of Stage Entertainments*, Law, unlike himself, was tempted by the unedifying corruptions of the stage of the period to use language which transcends the bounds of reason.

3. As one of the few English mystics. Though the least popular, by far the most interesting, original, and suggestive of all Law's works are those which he wrote in his later years, after he had become an enthusiastic admirer (not a disciple) of Jacob Boehme, the Teutonic theosopher. From his earliest years he had been deeply impressed with the piety, beauty, and thoughtfulness of the writings of the Christian mystic, but it was not till after his accident meeting with the works of Boehme, about 1734, that pronounced mysticism appears in his works. It would far transcend the limits of this article to describe, however briefly, the purport of Law's mystic writings. All are very beautiful; some are wild and fanciful, but not one of them is inconsistent with his position as a churchman, and even a very high churchman of the spiritual type. The titles of the works written by Law in his mystic stage are—

Demonstration of the Gross and Fundamental Errors of a late Book called a "Plain Account, &c., of the Lord's Supper," 1737; An Appeal to all that Doubt and Disbelieve the Truths of Revelation, 1739, The Grounds and Reason of Christian Regeneration, 1739, An Earnest and Serious Answer to Dr Pappi's Sermon on being Righteous Goeth, 1740, The Spirit of Prayer, 1749, 1752; The Way to Divine Knowledge, 1759, The Start of Love, 1752, 1754; A Short but Sufficient Confutation of Dr Warburton's Projected Defence (as he calls it) of Christianity in his Divine Legation of Moses, 1757, A Series of Letters, 1780, a Dialogue between a Methodist and a Churchman, 1760, and An Humble, Reasoned, and Affectionate Address to the Clergy, 1761.

Mr R Tipton wrote a short account of Law's life at the beginning of this century. Mr C Wallen printed for private circulation *Notes and Materials for a Complete Biography of W Law*, in 1850. Mr Leath Stephen in *The English Thought to the 16th Century*, p. 321. Locky in *The History of England to the 16th Century*, and Mr Abbey in *The English Church in the 16th Century*, all give sketches of Law's life, character, and works, and Mr Overton has devoted a volume to him, entitled *William Law, Non-juror and Mystic*, 1863.

LAWES, HENRY (1595-1662), a prominent member of the school of early English musicians, which culminated in Purcell, and was nipped in the bud by his early death, was born at Dinton in Wiltshire in December 1595, and received his musical education from John Cooper, better known under his Italian pseudonym Giovanni Operario, a famous composer of the day. In 1625 he was received as one of the gentlemen of the chapel royal, which place he held till the Commonwealth put a stop to church music. But even during that songless time Lawes continued his work as a composer, and the famous collection of his vocal pieces, *Lyres and Dialogues for One, Two, and Three Voices*, was published in 1653, being followed by two other books under the same title in 1655 and 1658 respectively. When in 1660 the king returned, Lawes once more entered the royal chapel, and composed an anthem for the coronation of Charles II. His death took place October 11, 1662. Lawes's name has become known beyond musical circles by his friendship with Milton, whose *Comus* he supplied with incidental music for the performance of the masque in 1634. The poet in return immortalized his friend in the famous sonnet beginning—

Henry, whose tuneful and well-measured song
First taught our English music how to span
Words with just note and accent, not to scan
With Mides' ears, committing short and long

In these lines, Milton, with a musical perception not common amongst poets, exactly indicates the great merit of Lawes, which distinguishes his compositions from those of many of his contemporaries and successors. His careful attention to the words of the poet, the manner in which his music seems to grow from those words, the perfect coincidence of the musical with the metrical accent, all put Lawes's songs on a level with those of Schumann or Lutz or any modern composer. At the same time he is by no means wanting in genuine melodic invention, and his concerted music shows the learned contrapuntist.

LAWRENCE, a city of Kansas, U.S., the capital of Douglas county, is situated on both sides of the Kansas river, about 40 miles above its junction with the Missouri. Founded in 1854 by the Massachusetts Emigrant Aid Society as a centre of the anti-slavery party, Lawrence was at first retarded in its development by the disturbed condition of the State, but its population has rapidly increased from 1645 in 1880 to 8511 in 1880, and it is now the fourth city in the State in population and wealth. It is a considerable railway junction, has a good trade, and numbers among its manufacturing establishments a pork-packing factory, planing-mills, foundries, carriage works, grist-mills, and breweries. A dam has been constructed across the Kansas. In 1862-63 the State university was settled at Lawrence, the buildings occupying a fine site on Mount Oread, a bluff in the south-west part of the city; in 1880 it had 14 teachers and 438 students. In 1866 Law-

rence was sacked and partially burned by a party of soldiers and Missourians claiming to act with the sanction of the U.S. Government, and in 1863, during the civil war, it was captured and burned by a Confederate guerrilla force.

LAWRENCE, a city of Massachusetts, U.S., one of the county seats of Essex county, 26 miles by rail north of Boston, on the Merrimack, about 35 miles from its mouth. The greater part lies on the north side of the river, to the west of the Spicket. Lawrence is emphatically a manufacturing town, and its rise and rapid development are mainly due to the abundant water-power supplied by the dam across the Merrimack and distributed by a canal a mile long and 14 feet deep. This is the property of the Essex Company, which was incorporated in 1845, and spent \$250,000 on the construction of the dam—a piece of granite masonry 1829 feet in length. The Bay State Woollen Mills (capital \$2,000,000) and the Atlantic Cotton Mills (capital \$1,500,000), both chartered in 1846, were the first great establishments to take advantage of the position. The Lawrence Duck Company and the Pacific Mills (capital \$300,000 and \$2,500,000) followed in 1853; the Washington Mills (\$1,650,000), taking the place of the Bay State, in 1858, the Everett (\$800,000) and the Pemberton Mills (\$450,000) in 1860, the Lawrence Woollen Company in 1863, the Arlington in 1865. There are now eight large "corporations," the largest of which, the Pacific Mills, alone employs 5800 operatives, and produces weekly 1,500,000 yards of cloth, printed or dyed. In 1880 the total number of looms in the cotton and woollen mills was 10,460, of spindles 345,988, and of operatives 13,124; and it is calculated that the average rate of production is 28,800,000 yards per week. The goods are of a varied description—broad cloth, fine flannels, shawls, pantaloons, felts, ticks, ginghams, &c. There are a number of large paper-mills in the town, as well as establishments for the manufacture of steam-engines, carriages, sewing machines, cordage, earthenware. Among the principal buildings and institutions may be mentioned the city hall (erected in 1847), the county court-house, the opera-house, the Oliver grammar school, and a public library (22,000 volumes). There are three public parks, one (17½ acres) in the heart of the city. Water works, deriving their supplies from the Merrimack, were opened in 1876 at a cost of \$1,700,000; the people had previously depended on wells and cisterns for drinking water. The population in 1850 was 8232; in 1860, 17,659; in 1870, 28,921, in 1880, 39,178. Lawrence, so-called in honour of the Lawrence family of Boston, was incorporated as a town in 1847, and attained the rank of a city in 1863.

LAWRENCE (LAURENTIUS, LORENZO), ST., according to Pope Leo the Great, whose account is that given also in the Roman Breviary, was a deacon, who in a time of persecution had been called on by the magistrate to give up the treasures committed to his keeping, and who thereupon had produced the church's poor, who were his special charge. Next, for his firmness in refusing to renounce Christ, he was subjected to scourging and laceration, and finally roasted to death on a gridiron. The later accounts of the martyrologists are much more circumstantial. According to these, Lawrence was a native of Huesca in Spain, but at a very early age had gone to Rome, where for his meekness and blamelessness he was chosen arch-deacon by Pope Sixtus II., and intrusted with the treasures of the church, consisting of vestments, plate, and a little money. Sixtus, having (in the reign of Valerian) been denounced as a Christian, was imprisoned and sentenced to death, whereupon Lawrence addressed to him the words which now form one of the antiphons in the office for St. Lawrence's day (August 10): "Whither goest thou, O

my father ! without thy son and servant ? " To this the pope replied with a prophecy that in three days Lawrence, the Levite should follow Sixtus the priest. At the same time Lawrence was directed to distribute the church treasures among the poor, and so prevent them from falling into the hands of the persecutor. When under the cruel punishment to which he was at last condemned for his steadfastness, he is said to have triumphed over the tyrant by the famous ironical speech—"Assatus est; jam versa et manduca." The fact of the martyrdom of St Lawrence seems to be well established, the most probable date being August 10, 258. The earliest extant mention of the event occurs in the writings of St Ambrose. Lawrence and his martyrdom have been favourite subjects for artistic treatment. Nuremberg, Genoa, and the Escorial are under his patronage.

LAWRENCE, JOHN LAIRD MAIR LAWRENCE, BARON (1811-1878), viceroy and governor-general of India, was born at Richmond, Yorkshire, 24th March 1811. His father, Colonel Alexander Lawrence, volunteered the forlorn hope at Seringapatam in presence of Baird and of Wellington, whose friend he became. His mother, Letitia Knox, was a collateral descendant of John Knox. To this couple were born twelve children, of whom three became famous in India, Sir George St Patrick, Sir Henry (noticed below), and Lord Lawrence. Irish Protestants, the boys were trained at Foyle College, Derry, and at Clifton, and received commissions from their mother's cousin, Mr Huddleston, who had been the friend of Schwartz in Tanjore. In 1829, when only seventeen, John Lawrence landed at Calcutta; he mastered the Persian language at the college of Fort William, and was sent to Delhi, on his own application, as assistant to the collector. The position was the most dangerous and difficult to which a Bengal civilian could be appointed at that time. The titular court of the pensioner who represented the Great Mogul was the centre of that disaffection and sensuality which found their opportunity in 1857. A Mussulman rabble filled the city. The district around, stretching from the desert of Rajpootana to the Jumna, was slowly recovering from the anarchy to which Lord Lake had given the first blow. When not administering justice in the city courts or under the village tree, John Lawrence was securing the country after the marauding Meos and Mohammedan freebooters. His keen insight and sleepless energy at once detected the murderer of his official superior, William Fraser, in 1835, in the person of the nabab of Lohari, whose father had been raised to the principality by Lake, and the assassin was executed. The first twenty years, from 1829 to 1849, during which John Lawrence acted as the magistrate and land revenue collector of the most turbulent and backward portion of the Indian empire as it then was, formed the period of the reforms of Lord William Bentinck. To what is now the lieutenant-governorship of the North-Western Provinces Lord Wellesley had promised the same permanent settlement of the land-tax which Lord Cornwallis had made with the large landholders or zemindars of Bengal. The court of directors, going to the opposite extreme, had sanctioned leases for only five years, so that agricultural progress was arrested. In 1833 Martins Bird and Thomason introduced the system of thirty years' leases based on a careful survey of every estate by trained civilians, and on the mapping of every village holding by native subordinates. These two revenue officers created a school of enthusiastic economists who rapidly registered and assessed an area as large as that of Great Britain, with a rural population of twenty-three millions. Of that school John Lawrence proved the most ardent and the most renowned. Intermittent his work at Delhi, he became land revenue settlement officer in the district of Etawah, and

there began, by buying out or getting rid of the talukdars, to realize the ideal which he did much to create throughout the rest of his career—a country "thickly cultivated by a fat contented yeomanry, each man riding his own horse, sitting under his own fig-tree, and enjoying his rude family comforts." Thus and a quiet persistent hostility to the oppression of the people by their chiefs formed the two features of his administrative policy throughout life.

It was fortunate for the British power that, when the first Sikh war broke out, John Lawrence was still collector of Delhi. The critical engagements at Ferozshah, following Mudki, and hardly redeemed by Aliwal, left the British army somewhat exhausted at the gate of the Punjab, in front of the Sikh entrenchments on the Sutlej. For the first seven weeks of 1845 there poured into camp, day by day, the supplies and munitions of war which this one man raised and pushed forward, with all the influence acquired during fifteen years of an iron yet sympathetic rule in the land between the Sutlej and the Jumna. The crowning victory of Sobraon was the result, and at thirty-five Lawrence became commissioner of the Jalandhar Doab, the fertile belt of hill and dale stretching from the Sutlej north to the Indus. The still youthful civilian did for the newly annexed territory what he had long before accomplished in and around Delhi. He restored it to order, without one regular soldier. By the fascination of his personal influence he organized levies of the Sikhs who had just been defeated, led them now against a chief in the upper hills and now to storm the fort of a raja in the lower, till he so welded the people into a loyal mass that he was ready to repeat the service of 1846 when, three years after, the second Sikh war ended in the conversion of the Punjab up to Peshawar into a British province.

The marquis of Dalhousie had to devise a government for a warlike population now numbering twenty-three millions, and covering an area little less than that of the United Kingdom. The first results were not hopeful (see next article), and it was not till John Lawrence became chief commissioner, and stood alone face to face with the chiefs and people and ring fence of still untamed border tribes, that there became possible the most successful experiment in the art of civilizing turbulent millions which history presents. The province was mapped out into districts, now numbering thirty-two, in addition to thirty-six tributary states, small and great. To each the thirty years' leases of the north-west settlement were applied, after a patient survey and assessment by skilled officials ever in the saddle or the tent. The revenue was raised on principles so fair to the peasantry that Ranjit Singh's exactions were reduced by a fourth, while agricultural improvements were encouraged. For the first time in its history since the earliest Aryan settlers had been overwhelmed by successive waves of invaders, the soil of the Punjab came to have a marketable value, which every year of British rule has increased. A stalwart police was organized; roads were cut through every district, and canals were constructed. Commerce followed on increasing cultivation and communications, courts brought justice to every man's door, and crime hid its head. The adventurous and warlike spirits, Sikh and Mohammedan, found a career in the new force of Irregulars directed by the chief commissioner himself under the governor-general, while Doet Mohammed kept within his own fastnesses, and the long extent of frontier at the foot of the passes was patrolled. In the brilliance of his later services to his country, this, the first, which alone rendered those possible, has not yet received justice.

Seven years of such work prepared the lately hostile and always anarchic Punjab under such a pilot as John Lawrence not only to weather the storm of 1857 but to

lead the older provinces into port. On the 12th May the news of the tragedies at Meerut and Delhi reached him at Rawal Pindi. The position was critical in the last degree, for of 50,000 native soldiers 38,000 were Hindustanis of the very class that had mutinied elsewhere, and the British troops were few and scattered. For five days the fate of the Punjab hung upon a thread, for the question was, Could the 12,000 Punjabis be trusted and the 38,000 Hindustanis be disarmed? Not an hour was lost in beginning the disarming at Lahore; and, as one by one the Hindustani corps succumbed to the epidemic of mutiny, the sepoys were deported or disappeared, or swelled the military rubble in and around the city of Delhi. The remembrance of the ten years' war which had closed only in 1849, a bountiful harvest, the old love of battle, the offer of good pay, but, above all, the personality of Lawrence and his officers, raised the Punjab force into a new army of 59,000 men, and induced the non-combatant classes to subscribe to a 6 per cent. loan. Delhi was invested, but for three months the rebel city did not fall. Under John Nicholson Lawrence sent out still more men to the siege, till every available European and faithful native soldier was there, while a movable column swept the country, and the border was kept by an improvised militia. At length, when even in the Punjab confidence became doubt, and doubt distrust, and that was passing into disaffection, John Lawrence was ready to consider whether we should not give up the Peshwar valley as a last resource, and send its garrison to recruit the force around Delhi. Another week and that must have been faced. But on the 30th September the city and palace were again in British hands, and the chief commissioner and his officers united in ascribing "to the Lord our God all the praise due for nerving the hearts of our statesmen and the arms of our soldiers." As Sir John Lawrence, Bart., G.C.B., with the thanks of parliament, the gratitude of his country, and a life pension of £2000 a year in addition to his ordinary pension of £1000, the "Saviour of India" returned home in 1859. While guarding the interests of India and its people as a member of the secretary of state's council, he was sent out again in 1864 as viceroy and governor-general on the resignation and death of Lord Elgin. At what appeared to be a critical time on the Punjab frontier Lord Palmerston recommended for the office the first civilian, not a peer, who has filled the governor-general's seat since Warren Hastings. If no great crisis enabled him to increase the lustre of his reputation, his five years' administration of the whole Indian empire was worthy of the ruler of the Punjab. His foreign policy has become a subject of imperial interest; his internal administration was remarkable for financial prudence, a jealous regard for the good of the masses of the people and of the British soldiers, and a generous interest in education, especially in its Christian aspects.

When in 1854 Dost Mohammed Khan, weakened by the antagonism of his brothers in Kandahar, and by the interference of Persia, sent his son to Peshawar to make a treaty, Sir John Lawrence was opposed to any entangling relation with the Afghans after the experience of 1838-42, but he obeyed Lord Dalhousie so far as to sign a treaty of perpetual peace and friendship. His ruling idea, the fruit of long and sad experience, was that *de facto* powers only should be recognized beyond the frontier. When in 1863 Dost Mohammed's death let loose the factions of Afghanistan he acted on this policy to such an extent that he recognized both the sons, Afzal Khan and Sher Ali, at different times, and the latter fully only when he had made himself master of all his father's kingdom. The steady advance of Russia from the north, notwithstanding the Gortschakoff circular of 1864, led to severe criticism of this cautious "buffer"

policy which he justified under the term of "masterly inactivity." But he was ready to receive Sher Ali in conference, and to aid him in consolidating his power after it had been established and maintained for a time, when his term of office came to an end and it fell to Lord Mayo, his successor, to hold the Amulka conference in 1869. When, nine years after, the second Afghan war was precipitated, the retired viceroy gave the last days of his life to an unsparring exposure, in the Houses of Lords and in the press, of a policy which he had striven to prevent in its inception, and which he did not cease to denounce in its course and consequences.

On his final return to England early in 1869, after forty years' service in and for India, "the great preceptor of our English Christian empire" was created Baron Lawrence of the Punjab, and of Grately, Hants. He assumed the same arms and crest as those of his brother Henry, with a Pathan and a Sikh trooper as supporters, and took as his motto "Be ready," his brother's being "Never give in." For ten years he gave himself to the work of the London school board, of which he was the first chairman, and of the Church Missionary Society. Latterly his eyesight failed, and on the 27th June 1873 he died at the age of sixty-eight. He was buried in the nave of Westminster Abbey, beside Clyde, Outram, and Livingstone. He married the daughter of the Rev. Richard Hamilton, Harriette-Katherine, C.L., who survived him; and he was succeeded by his eldest son, John Hamilton, born in 1840.

Beyond numerous minutes and reports, written in plain and trenchant English, and occasional lectures, Lord Lawrence published nothing. These, the printed *Speeches of Affairs* during his term of office as viceroy, the *Friend of India* from 1868 to 1870, the evidence which he gave before the East Indian Finance Committee of the House of Commons in June and July 1873, and the *Causes of the Afghan Wars*, edited by Sir Arthur Hobhouse, are the authorities for his life, until the memoir appears which Mr. Bosworth Smith is preparing. (G. SM.)

LAWRENCE, SIR HENRY MONTGOMERY (1800-1857), one of the greatest military statesmen of India, and provisional governor-general in the mutiny of 1857, was born at Madura, Ceylon, on 28th June 1806 (see last article). He inherited his father's stern devotion to duty and Celtic impulsiveness, tempered by his mother's gentleness and power of organization. Early in 1823 he joined the Bengal Artillery at the Calcutta suburb of Dum Dum where also Havelock was stationed about the same time. The two officers pursued a very similar career, and developed the same Puritan character up to the time that both passed away at Lucknow in 1857. In the first Burmese war Henry Lawrence and his guns formed part of the Chittagong column which General Morrison led over the jungly hills of Arakan, till fever decimated the officers and men, and the lieutenant found himself at home again, wasted by a disease which never left him. On his return to India with his younger brother John in 1829 he was appointed revenue surveyor by Lord William Bentinck. At Gorakhpur the wonderful personal influence which radiated from the young officer formed a school of attached friends and subordinates who were always eager to serve under him. After some years spent in camp, during which he had married his cousin Honoria Marshall, and had surveyed every village in four districts each larger than Yorkshire, he was recalled to a brigade by the outbreak of the first Afghan war towards the close of 1838. As assistant to Sir George Clerk, he now added to his knowledge of the people political experience in the management of the district of Peshawar; and when disaster came he was sent to Peshawar in order to push up supports for the relief of Sale and the garrison of Jalalabad. The war had been begun under the tripartite treaty signed at Lahore on 20th June 1838. But the Sikhs

were slow to play their part when the calamities in Afghanistan made it possible that the British might be driven south of the Jumna. No one but Henry Lawrence could manage the disorderly contingent which they reluctantly supplied to Pollock's avenging army in 1842. He helped to force the Khyber Pass on 5th April, playing his guns from the heights, for eight and twenty miles to recognition of his services Lord Ellenborough appointed him to the charge of the charming valley of Dehra Doo and its hill stations, Mussuri and Landaur, where he first formed the idea of asylums for the children of European soldiers. After a month's experience there it was discovered that the coveted appointment was the legal right of the civil service, and he was transferred, as assistant to the envoy at Lahore, to Ambala, where he reduced to order the lapsed territory of Kaithal. Soon he received the well-paid office of resident at the protected court of Nepal, amid the rest of which, assisted by his noble wife, he began a series of contributions to the *Calcutta Review*, a selected volume of which forms an Anglo-Indian classic. There, too, he elaborated his plans which resulted in the erection and endowment of the noblest philanthropic establishments in the East—the Lawrence military asylums at Sanawar (on the road to Simla), at Murree in the Punjab, at Mount Abu in Rajputana, and on the Madras Nilgiris. From 1844 to his death he devoted all his comparatively large income, above a modest pittance for his children, to this and other forms of catholic Christian charity.

The *Review* articles led the new governor-general, Lord Hardinge, to summon Lawrence to his side during the first Sikh war, and not these articles only. He had published the results of his experience of Sikh rule and soldiering in a vivid work, the *Adventures of an Officer in the Service of Ranjit Singh* (1845), in which he vainly attempted to disguise his own personality and exploits. For the next four years he virtually became Ranjit Singh's successor in the government of the Punjab. After the doubtful triumphs of Mudki and Ferozshah Lawrence was summoned from Nepal to take the place of the heroic Major George Broadfoot, who had fallen. Allwail came, then the guns of Sobraon chased the demoralized Sikhs across the Sutlej. All through the smoke Lawrence was at the side of the chivalrous governor-general. He gave his voice, not for the rescue of the people from anarchy by annexation, but for the reconstruction of the Sikh government, and was himself appointed resident at Lahore, with power "over every department and to any extent" as president of the council of regency till the maharaja Dhalip Singh should come of age. Soon disgusted by the "venal and selfish durbars" who formed his Sikh colleagues, he summoned to his side assistants like Nicholson, James Abbott, and Edwardes, till they all did too much for the people, as he regretfully confessed. But "my chief confidence was in my brother John, . . . who gave me always such help as only a brother could." Worn out he went home with Lord Hardinge, and was made K.C.B., when the second Sikh war summoned him back at the end of 1848 to see the whole edifice of Sikh "reconstruction" collapse. It fell to the marquis of Dalhousie to proclaim the Punjab up to the Khyber British territory on 29th March 1849. But still another compromise was tried. As the best man to reconcile the Sikh chiefs to the inevitable, Henry Lawrence was made president of the new board of administration with charge of the political duties, and his brother John was entrusted with the finances. John could not find the revenue necessary for the rapid civilization of the new province so long as Henry would, for political reasons, insist on granting life pensions and alienating large estates to the needy and sensual remnants of Ranjit

Singh's court. Lord Dalhousie delicately but firmly removed Sir Henry Lawrence to the charge of the great nobles of Rajputana, and installed John as chief commissioner. If resentment burned in Henry's heart, it was not against his younger brother, who would fain have retired. To him he said, "If you preserve the peace of the country and make the people high and low happy, I shall have no regrets that I vacated the field for you."

In the comparative rest of Rajputana he once more took up the pen as an army reformer. In March and September 1856 he published two articles, called forth by conversations with Lord Dalhousie at Calcutta, whither he had gone as the hero of a public banquet. The governor-general had vainly warned the home authorities against reducing below 40,000 the British garrison of India even for the Crimean campaigns, and had sought to improve the position of the sepoy. Lawrence pointed out the latent causes of mutiny, and uttered warnings only to be too soon justified. In March 1857 he yielded to Lord Canning's request that he should then take the helm at Lucknow, but it was too late. In ten days his magic rule put down administrative difficulties indeed, as he had done at Lahore. But what could even he effect with only 700 European soldiers, when the epidemic spread after the Meerut outbreak of mutiny on 10th May? In one week he had completed those preparations which made the defence of the Lucknow residency for ever memorable. Amid the deepening gloom Lord Canning ever wrote home of him as "a tower of strength," and he was appointed provisional governor-general. On the 30th May mutiny burst forth in Oudh, and he was ready. On 29th June, pressed by fretful colleagues, and wasted by unceasing toil, he led 336 British soldiers with 11 guns and 220 natives out to Chinhat to reconnoitre the insurgents, when the natives joined the enemy and the residency was besieged. On 2d July, as he lay exhausted by the day's work and the terrific heat in an exposed room, a shot struck him, and in forty-eight hours he was no more. A baronetcy was conferred on his son. A marble statue was placed in St Paul's as the national memorial of one who has been declared to be the noblest man that has lived and died for the good of India.

The authorities for his career, besides his own writings above mentioned, are his *Life* by Sir Herbert Edwards (vol. 1) and Herman Merivale (vol. II.), and the *Military Papers* (1867-68) published by Parliament. His form was tall, spare, and wasted, as is best seen in the engraving from a Lucknow photograph prefixed to *Rees's Personal Narratives of the Siege*. (G. S.M.)

LAWRENCE, SIR THOMAS (1769-1830), was born at Bristol on the 4th of May 1769. His father was an innkeeper first at Bristol and afterwards at Devizes, and at the age of six Thomas was already shown off to the guests of the Black Boy as an infant prodigy who could sketch their likenesses and declaim speeches from Milton. In 1779 the elder Lawrence had to leave Devizes, having failed in business, and the precocious talent of the son, who had gained a sort of reputation along the Bath road, became the support of the family. His debut as a crayon portrait painter was made at Oxford, where he was well patronised, and in 1782 the family settled in Bath, where the young artist soon found himself fully employed in taking crayon likenesses of the fashionables of the place at a guinea or a guinea and a half a head. In 1784 he gained the prize and silver gilt palette of the Society of Arts for a crayon drawing after Raphael's Transfiguration, and presently beginning to paint in oil, and throwing aside the idea of going on the stage which he had for a short time entertained, he came to London in 1787, was kindly received by Reynolds, and entered as a student at the Royal Academy. He began to exhibit almost immediately, and his reputation increased so rapidly that he became an

associate of the Academy in 1791. The death of Sir Joshua in 1792 opened the way to further successes. He was at once appointed painter to the Dilettanti Society, and principal painter to the king in room of Reynolds. In 1794 he was a Royal Academician, and he became the fashionable portrait painter of the age, having as his sitters all the rank, fashion, and talent of England, and ultimately most of the crowned heads of Europe. In 1816 he was knighted; in 1818 he went to Aix-la-Chapelle to paint the sovereigns and diplomatists gathered there, and extended his residence on the Continent by visiting Vienna and Rome, everywhere receiving flattering marks of distinction from princes, due as much to his courtly manners as to his merits as an artist. After eighteen months he returned to England, and on the very day of his arrival was chosen president of the Academy in room of West, who had died a few days before. This office he held from 1820 to his death on 7th January 1830. He was never married.

Sir Thomas Lawrence had all the qualities of personal manner and artistic style necessary to make a fashionable painter, and at a period when aristocratic opinion had even more weight than at present his public reputation was extravagantly high. The judgment of his fellow artists was less favourable, and in the present day no one would claim for him a place among great portrait painters, while his more ambitious works, in the classical style, such as his once celebrated *Satan*, are practically forgotten. His chief merit lay in a certain dexterity of touch and in the conventional grace with which he contrived to clothe his figures.

The best display of Lawrence's work is in the Waterloo Gallery of Windsor, a collection of much historical interest. "Master Lambert," painted for Lord Durham at the price of 600 guineas, is regarded as one of his best portraits, and a fine head in the National Gallery shows his power to advantage. *The Life and Correspondence of Sir T. Lawrence*, by Williams, appeared in 1831. See also Cunningham's *British Painters*, 1833.

LAYAMON, or LAWEMAN, the author of a chronicle of Britain entitled *Brut*, a poetical semi-Saxon paraphrase of the *Brut d'Angleterre* of Wace, was as he himself informs us a priest who read the services of the church at Eynley, on the banks of the Severn (now Lower Arley or Arley Regis, 3½ miles south-east from Bewdley, Worcestershire). Of his personal history nothing further is known. Nor can the date of the work with which his name is associated be very accurately ascertained, but the probability is that it was not completed before the beginning of the 13th century. The original text, with a literal translation, notes, and a grammatical glossary, was first edited by Sir Frederic Madden in 1847. See ENGLISH LANGUAGE, vol. vii. p. 394; and ENGLISH LITERATURE, s.v. p. 408.

LAYBACH. See LATBACH.

LAYNEZ, DIEGO. See JESUITES.

LAZARITES, LAZARISTS, or LAZARIANS. The origin of the "Congregation of Priests of the Mission" may in some sense be traced back to 1617, the year of the successful labours of St Vincent de Paul, assisted by five other priests, for the evangelization of the common people in the parish of Châtillon-sur-Chalaronne, near Bourg. More immediately it dates from 1625, when the little community acquired a permanent settlement in the Collège des Bons Enfants in Paris. Archbishopal recognition was obtained in 1626; and by papal bull in January 1632 the society was constituted a congregation, with St Vincent de Paul at its head. Shortly afterwards the establishment was confirmed by letters patent from Louis XIII. About the same time the canons regular of St Lazarus in Paris, which henceforth became its chief house, and gave to the fathers of the mission the name by which they are best known. Within a few years they had acquired another house in

Paris and set up other establishments throughout France; and in 1639, 1641, and 1651 they broke ground in Savoy, Italy, and Poland respectively. A fresh bull of Alexander VII. in April 1656 further confirmed the society; this was followed by a brief in September of the same year, regulating its constitution. The rules then adopted, which were framed on the model of those of the Jesuits, were published at Paris in 1659 under the title *Regula seu Constitutiones communis congregationis missionum*. The special objects contemplated were the religious instruction of the lower classes, the training of the clergy, the relief or redemption of prisoners in Barbary, and foreign missions. In the pursuit of these objects the Lazarite priests have had a chequered history in the various quarters of the world where they have gained a footing. At the French Revolution they were dispersed, so far as France was concerned, but permitted to reappear under the empire, and rehabilitated at the Restoration. In Sardinia they had a similar history. Throughout Italy they have been affected by recent political changes just as the rest of the religious orders have been. The Lazarite province of Poland was singularly prosperous; at the date of suppression in 1796 it possessed thirty-five establishments. The order was permitted to return in 1816, but is now extinct there. In Madagascar it had a mission from 1648 till 1674. In 1783 Lazarites were appointed to take the place of the Jesuits in the Levantine and Chinese missions; they still have some footing in China, and in 1874 their establishments throughout the Turkish empire numbered sixteen. In the same year they had fourteen establishments in the United States of America. The total number of Lazarites throughout the world is computed at about 3000.

LAZARUS, ST, ORDEX. This religious and military order dates its origin from the occupation of Jerusalem by the first crusaders, its primary object being the succour of the lepers, of whom Lazarus (Luke xvi. 20 sq.) was regarded as the patron. After the expulsion of the crusaders the hospitaliers of St Lazarus established themselves in France, where Louis VII (1268) gave them the lands of Boigny near Orleans, and a building at the gates of Paris which they turned into a lazaret house for the use of the lepers of the city. A papal confirmation was obtained from Alexander IV. in 1255. The gradual disappearance of leprosy combined with other causes to change the order into a purely civil corporation. In 1572 it was in Savoy merged by Gregory XIII. in the order of St Maurice. In 1608 it was in France united with that of Notre-Dame du Mont-Carmel; abolished at the Revolution, it was reintroduced at the Restoration, but is again in abeyance, the only order at present conferred or recognized being that of the Legion of Honour. In 1633 the buildings of the priory in Paris were handed over to St Vincent de Paul for the use of the fathers of his mission, who from this circumstance came to be generally known as Lazarites.

LEAD. This metal was known to the ancients, and is mentioned in the Old Testament. The Romans used it largely, as it is still used, for the making of water pipes, and soldered these with an alloy of lead and tin. Pliny treats of these two metals as *plumbum nigrum* and *plumbum album* respectively, which seems to show that at his time they were looked upon as being only two varieties of the same species. In regard to the ancients' knowledge of lead compounds, we may state that the substance described by Dioscorides as *μολύβδαβα* was undoubtedly litharge, that Pliny uses the word *minium* in its present sense of red lead, and that white lead was well known to Geber in the 8th century.

Of the various plumbiferous minerals, galena (a compound of lead and sulphur, formula PbS, demanding 86.6

per cent of metal) and white lead ore or cerussite, PbCO_3 (77.5 per cent), might almost be said to be the only ones which come into consideration as lead ores. Occasionally, however, the following also are utilized:—lead-vitrol or anglesite, PbSO_4 (68.3 per cent), and the pyromorphite group, $3(\text{Pb}_2 \text{ or } \text{As}_2)\text{O}_3 \cdot 3\text{PbO} + \text{PbCl}_2$ (76 to 69 per cent). Bournonite, CuPbSbS , may also be named, although containing 13 per cent of copper besides 43.3 per cent of lead; it is rather a copper than a lead ore.

Galena, the principal lead ore of the Old World, is a dark-coloured metallic-looking compact solid of 7.3 to 7.7 specific gravity and 2.5 hardness, crystallizing in cubes or other forms of the regular system, but often presenting itself in non-crystallized granular masses. All galena is contaminated with sulphide of silver,—the proportion of noble metal varying from about 0.01 or less to 0.3 per cent, and in rare cases coming up to $\frac{1}{2}$ or 1 per cent. Galena occurs in veins in the Cambrian clay-slate, accompanied by copper and iron pyrites, zinc-blende, quartz, calc-spar, iron-spar, &c.; also in beds or nests within sandstones and rudimentary limestones, and in a great many other geological formations. It is pretty widely diffused throughout the earth's crust. The principal English lead mines are in Derbyshire; but there are also mines at Allandale and other parts of western Northumberland, at Alston Moor and other parts of Cumberland, in the western parts of Durham, in Swaledale and Arkendale and other parts of Yorkshire, in Salop, in Cornwall, in the Mendip Hills in Somersetshire, and in the Isle of Man. The Welsh mines are chiefly in Flint, Cardigan, and Montgomery shires, the Scotch in Dumfries, Lanark, and Ayr, and the Irish in Wicklow, Waterford, and Down. Of Continental mines we may mention those in Saxony and in the Harz, Germany, those of Carinthia, Austria, and especially those of the southern provinces of Spain, from which country large quantities of lead are now imported into Great Britain.

The native carbonate occasionally presents itself in the form of pure crystals of the compound PbCO_3 ("cerussite"), but more frequently in a state of intimate intermixture with clay ("bleaside"), limestone, oxide of iron, &c. (as in the ores of Nevada and Colorado), and sometimes also with coal ("black lead ore"). All native carbonate of lead seems to be derived from what was originally galena, which, in fact, is always present in it as an admixture. This ore, metallurgically, was not reckoned of much value, until immense quantities of it were discovered in Nevada and in Colorado (U.S.). The Nevada mines are mostly grouped around the city of Eureka, about 200 leagues from San Francisco. The ore there occurs in "pockets" disseminated at random through limestone. The dimensions of these pockets are very variable; one is quoted measuring 300 by 60 by 180 feet. The crude ore contains about 30 per cent of lead and 0.2 to 0.3 per cent of silver. The Colorado lead district is situated pretty high up in the Rocky Mountains, a few miles from the source of the Arkansas river. The ore was discovered as late as 1877 by a mining engineer, Stephens. It forms gigantic deposits of almost constant thickness, embedded between a floor of limestone and a roof of porphyry. Stephens's discovery was the making of the city of Leadville, which, in 1878, within a year of its birth, had over 10,000 inhabitants. The Leadville ore contains from 24 to 42 per cent of lead and 0.1 to 2 per cent of silver. In Nevada and Colorado the ore is worked chiefly for the sake of the silver; but this industry, especially since 1878, has developed at such a rate as to seriously affect the price of lead even in Europe. Of other American lead districts the most important are those of Utah, of Missouri, and of the Upper Mississippi, where the ore consists substantially of galena.

The extraction of the metal from pure (or nearly pure) galena is the simplest of all metallurgical operations. The ore is roasted (i.e., heated in the presence of atmospheric oxygen) until all the sulphur is burned away and the lead left. This simple statement, however, correctly formulates only the final result. The first effect of the roasting is the elimination of sulphur as sulphurous acid, with formation of oxide and sulphate of lead. In practice this oxidation process is continued until the whole of the oxygen is as nearly as possible equal in weight to the sulphur present as sulphide or as sulphate. The heat is then raised in (relative) absence of air, when the two elements named unite into sulphurous acid (SO_2), while a regulus of molten lead remains. In Wales and the south of England the process is conducted in reverberatory furnaces of the form shown in fig. 1. The sole of the furnace is paved with slag from

Fig. 1—Reverberatory Furnace. C, chimney; D, opening for feeding the fire.

previous operations, and has a depression in the middle where the metal formed collects to be let off by a tap-hole T. The dressed ore, 12 to 24 cwt., is introduced through the "hopper" H at the top, and exposed to a moderate oxidizing flame until a certain proportion of ore is oxidized, the openings O, O at the side enabling the workmen to stir up the ore so as to constantly renew the surface exposed to the air. At this stage as a rule some rich slags of a former operation are added and a quantity of quicklime is incorporated, the chief object of which is to diminish the fluidity of the mass in the next stage, which consists in this, that, with closed air-holes, the heat is raised so as to cause the oxide and sulphate on the one hand and the sulphide on the other to reduce each other to metal. The lead produced runs into the hollow and is tapped off. The roasting process is then resumed, to be followed by another reduction, and so on.

A similar process is used in Carinthia; only the furnaces are smaller (adapted to a charge of only 420 lb.) and of a somewhat different form. They are long and narrow, the sole is paved, but slopes from the fire-bridge towards the flue, so that the metal runs to the latter end to collect in pots placed outside the furnace. In Carinthia the oxidizing process from the first is pushed on so far that metallic lead begins to show, and the oxygen introduced predominates over the sulphur left. The mass is then stirred to liberate the lead, which is removed as "Ruhblei". Charcoal is now added, and the heat raised on to obtain "Pressblei", an inferior metal famed partly by the action of the charcoal on the oxide of lead. The fuel used is fir-wood.¹

In Cumberland, Northumberland, and Durham the reverberatory furnace is used only for roasting the ore, and the oxidized ore is then reduced by fusion in a low square blast furnace (a "Scottish hearth furnace") as depicted in figs. 2 and 3. The rectangular cavity C is lined with cast-iron, as is also the inclined sole-plate which is made to project beyond the furnace, the outside portion W (the "work-stone") being provided with grooves guiding any molten metal that may be placed on the "stone" into the cast-iron pot P, it is the "tuyere" for the introduction of the wind.

As a preliminary to the melting process, the "blowse" left in the preceding operation (half-fused and imperfectly reduced ore) is intro-

¹ In England coal is employed everywhere, sometimes along with peat.

dined with some peat and coal, and heated with the help of the blast. It is then taken out on the work-stone and divided into a very poor "grey" slag which is put aside and a richer portion which goes back into the furnace. Some of the best ore is shewed upon

FIG 2—Vertical Section of Furnace

FIG 3—Horizontal Section

it, and, after a quarter of an hour's working, the whole is taken out on the work-stone, where the lead produced runs off. The "brown" after removal of the "grey" slag, is reintroduced, ore added, and, after a quarter of an hour's heating, the mass again placed on the work-stone, &c.

In any form of the lead-smelting process one of the conditions of complete success is the absence of silica, because this when present unites with a certain proportion of the oxide of lead into a fusible silicate (slag). Practically the formation of a plumbiferous slag cannot be altogether avoided in any case, and such slag accordingly must be worked up. At Alston Moor, Cumberland, this is effected by means of a hearth (blast) furnace similar to the one just described. The slags (oxide, sulphate, and silicate of lead) are introduced with coal-ashes, furnace bottoms, and other residues, and melted down, thus leading to the formation of lead and of a poorer slag. The lead is run off as much as possible, the slag is run into water, which disintegrates it so that the particles of metal shut up within it are set free and become recoverable by elutriation.

Lead being very appreciably volatile at a red heat, lead-smelting generally, but more especially the Scottish-hearth process, and pre-eminently the slag-recovery process, involve the production of large quantities of "lead-smoke" (finely divided, highly impure oxide and sulphate of lead), which, for sanitary and economic reasons, must be condensed and recovered. At Alston Moor the smoke for this purpose is led through a very long succession of flues, ascending the slope of a hill, into a chamber at the top which communicates with a chimney. The chamber, by a number of screens going alternately from the floor to near the top, and *vice versa*, is divided into compartments charged with such a quantity of water that the smoke, which is propelled by means of a fan, is compelled to bubble repeatedly through the water, where most of what has failed to come down in the flues is precipitated. The smoke deposit is collected, dried, and worked up for lead.

Carbonate and oxide of lead are easily reduced by charcoal or coal. In Leadville and Eureka (U.S.) the carbonate is smelted with charcoal in small blast furnaces, about 8 feet high, and rectangular section of 31 by 47 inches, worked with charges of about three tons of ore. There are five tuyeres, two at each of the longer sides, and one at the end opposite the outlet-hole. The "crucible" is quite surrounded by hollow wrought-iron plates, kept cool by circulating water.

Complex lead ores of course demand a complex treatment. The famous Frankensharner Huette near Klausthal

in the Haaz, where a very complex ore is worked up with a wonderful degree of exhaustiveness and precision, may serve as an example. The ore in this case consists of argentiferous galena associated with copper pyrites, fahl-ore, bismuthite, zinc blende, and a gangue consisting of silica, limestone, and heavy spar. After the copper pyrites has been, as far as possible, picked out by hand, the remainder is assorted so as to produce an average of about 55 per cent of lead. One hundred parts of such ore are mixed with 11 of hearth-mass and litharge, 90 parts of a variety of slags from previous operations, and 11 parts of metallic iron (or the equivalent of some rich iron ore plus charcoal), and melted down in blast furnaces similar to those used for iron-smelting, but only 32 feet high. The furnace is charged with alternate layers of ore mixture and charcoal. The smelting takes fourteen hours, and yields per charge of 100 parts of ore (containing in all about 74 parts of lead) 26 parts of metallic lead, and 18.4 parts of a "stein" consisting of an alloy of sulphides of lead, iron, copper, zinc, silver, antimony, intimately mixed with particles of metallic and (1 sub) sulphide of lead—apart from the slags formed, which contain 4 to 8 per cent of lead and a trace of silver. The "stein" is subjected to a protracted series of roasting, and then melted down with iron and selected slags. These result a ferruginous slag, a certain proportion of metallic lead, and a "stein" of the second order, which of course is richer in copper than the original one was. This "stein" is again roasted, melted down with iron, &c., until the whole of the lead is extracted, and the copper concentrated in a mass sufficiently rich and pure to be wrought as a copper "stein."

Refining.—The lead obtained by any of the above processes is as a rule contaminated with more or less of iron, antimony, zinc, arsenic, and silver, which must be removed.—The base foreign metals because they deteriorate the lead, the silver on account of its high commercial value. The base metals are easily eliminated by subjecting the crude metal to oxidizing fusion in a shallow cast-iron dish inserted into a reverberatory furnace, the foreign metals, being more oxidizable than lead, go to the top as an oxide-scum, which is constantly removed until pure litharge, instead of the foreign oxides, makes its appearance.

The extraction of the silver is easily effected by means of the process of cupellation, one of the oldest metallurgical operations, which dates back to a time beyond that of Phry. The metal is placed on a shallow kind of dish made of compressed bone-ash powder and forming the sole of a reverberatory furnace, and therein kept at a red heat in the presence of an abundant supply of air. The lead (and with it the foreign base metals) is oxidized into "litharge" (PbO), which, at the temperature prevailing, melts into a thin liquid, and is made to run off through a slit or hole made in the side of the "cupel" (or "test"), the silver remains unchanged, so that the regulus becomes richer and richer as the process proceeds. The foreign base metals, as will readily be understood, go off as oxides along with the first portion of litharge, and accordingly can be removed without contaminating the bulk of the latter product. When the percentage of silver has increased to about 8 per cent, the regulus, as a rule, is transferred to a fresh cupel, and thereon treated in the same way as before, until the last trace of litharge is seen to go off as a thin film on the regulus, presenting, on account of its thinness, in the glow of the fire, the magnificent appearance of a soap-bubble in sunlight. The silver then is "fine," *i.e.*, almost pure, and ready for the market. The lead, however, is all obtained in the shape of oxide, and consequently, if not saleable as such, must

be reduced with charcoal or coal. The process accordingly is expensive, and generally does not pay with a raw lead containing less than 75 per cent. of the noble metal.

The process, in its direct application to the lead, is now almost extinct, being superseded by the following two methods of "concentration," which offer the advantage of desilverizing at least the bulk of the lead without depriving it of its metallicty.

1. *Pattinson's Process* (invented about forty years ago) is founded upon the fact that, when molten argentiferous lead is allowed to cool slowly, a relatively silver-free lead crystallizes out while a richer metal remains as a mother-liquor. It will be readily understood that, by a persistent systematic application of this method of partial separation to the primary products and again to their derivatives, it is possible to, so to say, split the original material into a very poor portion containing most of the lead, and a "rich" one containing almost all the silver. Practical smelters are generally satisfied when the proportion of silver in the former is reduced to from the one to the three millionth of the weight of the lead, and the latter enriched to the extent of 0.5 to 1.5 per cent. of silver, although it is possible to bring up the percentage to 2.5. A lead containing as little as half an ounce of silver per ton can be "Pattinsonized" with a profit.

2. *Karsten's Process* is still more perfect. It has long been known that lead refuses to alloy itself with more than traces of zinc. In 1842 the eminent metallurgist Karsten made the important discovery that, when argentiferous lead is mixed with 1 per cent. or more of zinc (at a temperature insuring liquidity to even the latter metal), about $\frac{1}{2}$ per cent. of zinc remains dissolved in the lead, while the rest rises to the top as a scum, and, besides a deal of lead, takes almost the whole of the silver with it. Parkes subsequently brought the process into a workable form, for which he took a patent in England in 1850. The argentiferous lead is molten in large cast-iron pots, intimately mixed with about 30 parts of zinc per unit of silver present; the mixture allowed to rest, and the argentiferous scum removed by means of perforated ladles. The scum, when subjected to "liquation" (partial fusion) on an inclined sole, lets off a quantity of rich lead, which goes to the cupel. From the residue the bulk of the zinc can be withdrawn by distillation, the non-volatile part being fit for cupellation. The desilverized lead is freed from its zinc and the other base impurities it may contain by "refining" (see above). The Parkes process seems to be on a far wiser way of being superseded by a far more perfect form of the Karsten method which was patented by Corduruf for France in 1886 (October 18, No. 73,167), and of which the most characteristic feature is that the removal of the zinc from the scum and the refining of the desilverized lead are both effected by means of superheated steam. The treatment with zinc is effected in a deep upright half-egg-shaped cast-iron pan (standing on an upper floor), which is provided with a vertical shaft bearing horizontal paddles, and at its lowest point perforated cast-iron box, which serves to accommodate the zinc, 1 kilogramme per 100 kilos of crude lead containing 0.1 kilo of silver, or up to twice the proportion for richer leads. The argentiferous lead—10 tons at a time—is melted down in the pan, and the paddle-shaft with the zinc introduced and made to revolve until all the zinc has become incorporated with the mass. The shaft is then withdrawn, the mixture allowed to rest for a time at a lower temperature, the scum removed, and the zinc treatment repeated once or twice to eliminate the whole of the silver. The desilverized lead runs direct from the pan into another pan standing on the ground floor, which has no tap-hole, but is provided with a wrought-iron hood communicating by means of a pipe with a condensation

chamber. In this pan the metal is heated to redness, and a current of superheated steam is blown through it for two or three hours. The zinc and the rest of the impurities are thereby converted into oxides which mostly remain on the surface of the metal, the rest being carried into the chamber and deposited there. The silver scums, after extraction from them of argentiferous lead by lixiviation, are collected, and, when a sufficient quantity has accumulated, worked with superheated steam like the zinciferous lead,—to produce a richly argentiferous regulus, adapted for cupelling, and an oxide-mixture intimately intermixed with particles of the former and containing even some silver oxide. The working of this bye-product seems to have given the inventor a deal of trouble. Passing over his method, we will mention the one introduced in Lantseh since 1869. There they dispose of the argentiferous oxides by adding them to the rich lead during its cupellation; the silver is sucked in by the regulus, the base oxides amalgamate with the litharge. The "poor" lead resulting from this form of the Karsten process contains only 5 or 6 grammes of silver per metric ton (i.e., per million grammes). The loss of lead with a pure material is only 1 per cent. as against the 4 per cent. involved in the Pattinson process.

It is worth stating that the zinc removes, besides the silver, all the copper that may be present, and no doubt also part of the other foreign base metals. At any rate the purity of commercial lead, since the introduction of Corduruf's process, has undergone a marked increase. Hampé analysed a "refined" lead produced in the "Lautehaler Hütte" in 1870, and found it to contain only .016 per cent. of impurities. This to all intents and purposes means chemical purity, yet even such lead is not fit for silver assaying, or account of the trace of silver contained in it. To obtain silver-free lead, we must prepare silver-free acetate of lead—by digesting its solution in a lead vessel with lead shavings and filtering,—and reduce the dried salt with black zinc in a crucible lined with charcoal.

Properties of Lead and its Oxides—Pure lead is a feebly lustrous bluish-white metal, endowed with a characteristically high degree of softness and plasticity, and almost entirely devoid of elasticity. Its breaking strain is very small, a wire $\frac{1}{16}$ of an inch thick is ruptured by a charge of about 30 lb. The specific gravity was determined exactly by Reaumur, who found for ingot 11,352, for sheet metal 11,354 to 11,355 (water of 4° C. = 1). The expansion of unit-length from 0° C. to 100° C. is 0.02948 (Fizeau). The conductivity for heat (Wiedemann and Franz) or electricity is 8.5, that of silver being taken as unity. It melts at 324° C. = 633° Fahr. (Personne); at a bright red heat it emits vapours, at the rate, according to A. de Biernsky, of about $\frac{1}{1000}$ of its weight per hour; but he does not specify the surface. At a white heat it boils. The specific heat is .0314 (Regnault), that of water near 0° C. being taken as unity. Lead exposed to ordinary air is rapidly tarnished, but the thin dark film (of suboxide?) formed is very slow in increasing. When kept in fusion in the presence of air lead readily takes up oxygen, with formation first of a dark-coloured scum (of suboxide?), then of monoxide PbO, the rate of oxidation increasing with the temperature. This oxide is produced industrially in two forms, known as "massicot" and "litharge."

The former is produced at temperatures below, the latter at temperatures above the fusing-point of the oxide. The liquid litharge when allowed to cool solidifies into a hard stone-like mass, which, however, when left to itself, soon crumbles up spontaneously into a heap of resplendent dark-yellow scales known as "flake litharge." Litharge is much used in the arts for the preparation of lead salts, for the manufacture of oil varnishes, of certain

cements, and of lead plaster, and for other purposes Massicot is important as being the raw material for the manufacture of "red lead" or "minium." Finely divided massicot, freed from admixed metal by elutriation, is spread out on the flat sole of a kind of baker's oven, or (better) of a "mufflo" heated from the outside, and therein exposed for twenty-four hours or more to air at a temperature of about 300° C. or 600° Fahr. The massicot, at a gradually decreasing rate, absorbs oxygen, and as the latter increases the colour becomes more and more intensely red,—the point of saturation corresponding very nearly to the formula Pb_3O_4 . A more highly oxygenated kind of minium ("orange lead") can be produced by substituting white lead for massicot as a raw material. The composition of orange lead approximates to Pb_3O_4 . It is very singular that this higher oxide cannot be obtained from massicot, although the first effect of heat on white lead is its conversion into the oxide PbO . Besides the two named there is another red oxide, of the composition Pb_3O_4 , but it is not much known. Red lead is largely used as a pigment and as an ingredient for flint glass, also for the making of certain cements. Any of these red oxides when treated with dilute nitric acid is converted into the binoxide PbO_2 , protoxide passing into solution as nitrate: e.g., $Pb_3O_4 + 2HNO_3 = 3PbON_3 + PbO_2 + 2H_2O$. The binoxide is a brown powder, insoluble in aqueous oxygenated acids, but converted by hot hydrochloric acid into chloride $PbCl_2$, with evolution of chlorine. To obtain the binoxide in the state of purity, the best method is to pass chlorine into a solution of acetate of lead mixed with excess of carbonate of soda. The hypochlorite formed oxidizes the PbO into PbO_2 , with formation of chloride of sodium and free acetic acid (Wöhler).

Action of Aqueous Reagents.—Water when absolutely pure has no action on lead by itself. In the presence of free oxygen (air), however, the lead is quickly corroded with formation of hydrated oxide ($Pb(OH)_2$), which is appreciably soluble in water forming an alkaline liquid. When carbonic acid is present the dissolved oxide is soon precipitated as basic carbonate, so that there is room made, so to say, for fresh hydrated oxide, and the corrosion of the lead progresses. Now, all soluble lead compounds are strong cumulative poisons, hence the danger involved in using lead cisterns or pipes in the distribution of pure waters. We emphasize the word "pure" because experience shows that the presence in a water of even small proportions of bicarbonate or sulphate of lime prevents the action on lead. All impurities do not act in a similar way. Nitrate and nitrite of ammonia, for instance, intensify the action of a water on lead. It is to be remarked, however, that even pure waters, such as that of Loch Katrine (which forms the Glasgow supply), act so slowly, at least on such lead pipes as have already been in use for some time, that there is no danger in using such lead service pipes even for them, if the taps, as in any house hold under normal circumstances, are being constantly used. Lead cisterns of course must be unhesitatingly condemned. G. Bischoff found that a water pipe made of a "composition" consisting of 1 part cent of antimony and 98.8 of lead was rapidly corroded by a water which, in virtue of its composition, had no action on lead pipes.

Action of Acids.—The presence of carbonic acid in a water does not affect its action on lead (Pattison Muir). Aqueous non-oxidizing acids generally have little or no action on lead in the absence of air. Dilute sulphuric acid (say an acid of 20 per cent of H_2SO_4 or less) has no action on lead even when air is present, nor on boiling. Stronger acid (e.g., any acid strong enough to fairly fall within the meaning of "vitriol") does act, slowly in general, but appreciably, the more so the greater its concentration and the higher its temperature. According to Haaselevier, whose experiments were subsequently confirmed by A. Beuz and by James Maclean, pure lead, *cast par*, is far more readily corroded than a metal contaminated with 1 per cent or even less of antimony or copper. Haaselevier treated an almost pure lead with pure vitriol of 54° Beaumé (1.55 sp. gr., or 34–35 per cent H_2SO_4) in a glass flask. At 42° C. an evolution of gas was observable, which at 85° C. became very distinct. The same lead, after having been alloyed with a little antimony, was not visibly attacked below 85° C. A decided gas-evolution commenced only at 140° C. Boiling concentrated vitriol converts lead into sulphate, with evolution of sulphurous acid. Dilute nitric acid readily dissolves the metal, with formation of nitrate $Pb(NO_3)_2$.

Lead Alloys.—Lead unites readily with almost all other metals; hence, and on account of its being used for the extraction of (for instance) silver, its alchemistic name of saturnus. Of the alloys the following may be named:—

With Antimony.—Lead contaminated with small proportions of antimony is more highly proof against vitriol than the pure metal. An alloy of 83 parts of lead and 17 of antimony is used as type metal, other proportions are used, however, and other metals added besides antimony (e.g., tin, bismuth) to give the alloy certain properties.

With Arsenic.—Lead unites readily with arsenic, and an alloy made by addition of about 5 per cent of arsenic is used for making shot.

Bismuth and Antimony.—An alloy consisting of 9 parts of lead, 2 of antimony, and 2 of bismuth is used for stereotype plates.

Bismuth and Tin.—These triple alloys are noted for their low fusing points. An alloy of 6 of lead, 5 of bismuth, and 3 of tin fuses at 94° C.; i.e., below the boiling-point of water (Rose's metal). An alloy of 15 parts of bismuth, 6 of lead, 4 of tin, and 3 of cadmium (Wood's alloy) melts below 70° C.

Tin unites with lead in any proportion with slight expansion (Kupffer), the alloy fusing at a lower temperature than either component. It is used largely for soldering. The following are the compositions and melting-points of frequently used compounds (Tomlinson)—

	Tin	Lead	Melts at
Fine solder	2	1	540° F.
Common do	1	1	370° F.
Coarse do	1	2	441° F.

"Pewter" may be said to be substantially an alloy of the same two metals; but small quantities of copper, antimony, and zinc are frequently added. Common pewter contains about 5 parts of tin for 1 of lead. In France a tin-lead alloy, containing not over 18 per cent of lead, is recognized by law as being fit for measures for wine or vinegar. "Best pewter" is just tin alloyed with a mere trifle (3 per cent, or less) of copper.

Lead Salts.—Of the oxides of lead the protoxide, PbO , is the only one which under ordinary conditions is capable of forming salts. Towards potash and soda it plays the part of feeble acid, being readily soluble in solutions of either caustic alkali; while with acids it behaves as a decided diacid base. By a "diacid base" is meant a base which can unite with two monovalent acids at the same time, and form a stable salt. Take, for instance, the case of chloride of lead, $PbCl_2$, which is related to HCl and $Pb(OH)_2$ exactly as KCl is to HCl and $K(OH)$, but, while there is nothing between KCl and $K(OH)$, the two lead compounds readily unite into $Cl-Pb-(OH)$, oxychloride of lead. This property, common to all diacid bases, is developed in lead oxide to a characteristically high degree.

The nitrate, $Pb(NO_3)_2$, easily obtained from the metal as explained above, or by dissolving the oxide in aqueous nitric acid, forms white crystals, difficultly soluble in cold, readily in hot water, almost insoluble in strong nitric acid. It is decomposed by heat into oxide, peroxide of nitrogen (N_2O_5), and oxygen. It is used for the manufacture of fuses and other deflagrating compounds. The numerous basic nitrates must here be passed over.

The acetate, $Pb(CH_3COO)_2 \cdot 3H_2O$ (called "sugar" of lead, on account of its sweetish taste), is manufactured by dissolving massicot in aqueous acetic acid. It forms colourless transparent crystals, soluble in one and a half parts of cold water and in eight parts of alcohol, which on exposure to ordinary air become opaque through absorption of carbonic acid, which forms a crust of basic carbonate. An aqueous solution readily dissolves oxides of lead, with formation of a strongly alkaline solution containing basic acetates (*Acetum Plumbi* or *Saturum*). When carbonic acid is passed into this solution the whole of the added oxide, and even part of the oxide of the neutral salt, is precipitated as a basic carbonate chemically similar, but not quite equivalent as a pigment, to white lead.

The carbonate, $PbCO_3$, exists in nature as cerussite. It can be produced by addition of a solution of lead salt to an excess of carbonate of ammonia, as an almost insoluble white precipitate. Of greater practical importance is a basic carbonate, substantially $2PbCO_3 \cdot Pb(OH)_2$, which is largely used as a white pigment under the name of "white lead." For the manufacture of this important substance two methods chiefly are used. In the Old Dutch method, pieces of sheet lead are suspended in stoneware pots so as to occupy the upper two-thirds of the vessels. A little vinegar is poured into each pot; they are then covered with plates of sheet

lead, burned in horse-dung or spent tanner's bark, and left to themselves for a considerable time. The organic bath, through its fermentation, keeps up a suitable temperature and a constant supply of carbonic acid. By the conjoint action of the acetic acid and atmospheric oxygen, the lead is converted superficially into a basic acetate, which is at once decomposed by the carbonic acid, with formation of white lead and acetic acid, which latter then acts *de novo*. After a month or so the plates are converted to a more or less considerable depth into crusts of white lead. These are knocked off, ground up with water, freed from metal-plates by elutriation, and the paste of white lead is allowed to sit and dry in small conical forms. The collection, however, of these plates is not yet in commerce. The German method differs from the Dutch in this that the lead is suspended in a large chamber heated by ordinary means, and there exposed to the simultaneous action of vapour of aqueous acetic acid and of carbonic acid. In the famous works at Ragnersfirth and in the Lavantthal, Carinthia, the sublimed and is produced by the fermentation of apple-must or infusion of raisins kept in tubs below the chambers. The inferior varieties of commercial "white lead" are produced by mixing the genuine article with more or less of finely powdered heavy spar or occasionally zinc-white (ZnO), which latter, we may state in passing, is the most important of the relatively non-poisonous substitutes for white lead.

The chloride, $PbCl_2$, is obtained by adding hydrochloric acid to a solution of lead salt, as a white precipitate, little soluble in cold water, less so in dilute hydrochloric acid, more so in the strong acid, and readily soluble in hot water, from which, on cooling, the excess of dissolved salt separates out in acicular crystals. A basic chloride Pb_2OCl_2 was introduced by Pattinson as a substitute for white lead. Powdered galena is dissolved in hot murettic acid ($PbS + 2HCl = PbCl_2 + H_2S$), the solution allowed to cool, and the deposit of impure chloride of lead washed with cold water to remove iron and copper. The residue is then dissolved in hot water, the dregs are filtered off, and the clear solution is mixed with very thin milk of lime so adjusted that it takes out one-half of the chlorine of the $PbCl_2$. The oxychloride comes down as an amorphous white precipitate. Another oxychloride, $PbCl_2 \cdot PbO$, known as "Cassel yellow," is produced by fusing pure oxide, PbO , with $\frac{1}{10}$ th of its weight of sesquioxide.

The sulphate, $PbSO_4$, is obtained, by addition of sulphuric acid to solutions of lead salts, as a white precipitate almost insoluble in water, less soluble still in dilute sulphuric acid, insoluble in alcohol. Sulphide of ammonium blackens it, and it is soluble in solution of alkaline acetate of ammonia, which dissolves it from sulphate of baryta.

It is often obtained industrially as a bye-product. The chromate, $PbCrO_4$, is prepared industrially as a yellow pigment, by precipitating sugar of lead solution with bichromate of potash. The beautiful yellow precipitate is little soluble in dilute nitric acid, but soluble in caustic potash ley. The vermilion-like pigment which occurs in commerce as "chrome-red" is a basic chromate, prepared by treating recently precipitated normal chromate with a properly adjusted proportion of caustic soda, or by boiling it with normal (yellow) chromate of potash. The approximate composition is $Cr_2O_3 \cdot 2PbO$.

The identification of lead compounds is easy. When mixed with carbonates of soda and heated on charcoal in the reducing flame they yield malleable globules of metal and a yellow oxide-rim. Solutions of lead salts (colourless in the absence of coloured acids) are characterized by their behaviour to hydrochloric acid, sulphuric acid, and chromate of potash. But the most delicate reagent for lead is sulphuretted hydrogen, which produces a black precipitate of sulphide of lead, insoluble in cold dilute nitric acid, less so in cold hydrochloric, easily decomposed by hot hydrochloric with formation of the characteristic chloride.

Statistics.—The lead, pig and sheet, imported into Great Britain during the year 1880 amounted to 85,322 tons, and during 1881 to 93,400 tons. In 1881 there were 12,824 tons exported to China, 8855 to Russia, 4715 to Australia, 3380 to France, 3349 to British India, 1041 to Germany, and 8887 to other countries.

The following table exhibits the production of lead during 1876—

Spain	Tons	Italy	Tons
Germany	101,822	Greece	9000
Great Britain	82,772	Belgium	8000
United States	59,606	Austria	7875
France	57,210	Russia	4261
	21,889		1069

The importation and production of lead in the United States were in the years stated respectively as follows.—

	Imported	Produced
	Tons.	Tons.
1886	28,225	14,680
1889	36,111 (max.)	15,450
1878	285	81,804

(W. D.)

LEADVILLE, a flourishing mining town of the United States, capital of Lake county, Colorado, is situated at a height of 10,300 feet above the sea, on a narrow plateau between the Saguache or Continental Divide and the Park Range of the Rocky Mountains, about 70 miles south-west of Denver. It is connected with Denver by a branch of the Union Pacific Railway (172 miles), and by the Denver and Rio Grande Railway (379 miles). Though a place of 14,820 inhabitants at the census of 1881, Leadville was then the creation of scarcely more than three years.

As early as 1860 gold placers were discovered in the neighbourhood, and for a little time the settlement of Brough Town, as it was then called, was a busy spot in this thinly peopled region. But the gold was soon exhausted, and, though it was vaguely understood that the heavy black sand which had often proved troublesome to the gold-washers was more or less argentiferous, it was not till 1877 that the first practical attempt to turn it to account was made. No sooner, however, was the real character of the ore ascertained than eager adventurers rushed to Leadville by thousands. In August 1877 there were not more than twenty stamens on the site of the town; but the population rapidly increased, and in less than two years numbered upwards of 15,000. The first assaying furnace was set to work in October 1877. It has been estimated that up to the close of 1880 the value of the metals extracted from the soil at Leadville exceeded \$35,700,000—

1860-72, gold from placers	\$8,400,000	1877, gold, silver, and lead	\$659,280
1874, gold and silver	\$4,000,000	1878, do	\$1,192,922
1876, do	118,000	1879, do	10,189,671
1876, gold, silver, and lead	85,200	1880, do	15,096,168

The site consists for the most part of a porphyritic rock resting on a strongly schistified dolomite popularly called "limestone"; and the brown sand, the source of the wealth of Leadville, is sometimes found just below the surface of the soil, sometimes at a depth of several hundred feet. None of the streets maintain the same level throughout, the contour lines of the declivity on which they are built usually running at right angles. Of the dwelling-houses the vast majority are of wood, but among the many substantial brick structures are an opera-house, a Catholic church, and several bank buildings. Water, brought from the higher grounds, is distributed by a regular system of mains. The principal streets are macadamized with slag, there is a well-organized fire department and an efficient police force. The city has 5 churches, 7 schools, 3 daily and 2 weekly newspapers, and 6 banks, and is the centre of supply for a large outlying mining region, the value of its general and mining business averaging for 1880 and 1881 over \$40,000,000 yearly.

LEAKE, WILLIAM MARTIN (1777-1860), antiquarian topographer, was born in London, January 14, 1777. After completing his education at the Royal Military Academy of Woolwich, and spending four years in the West Indies as lieutenant of marine artillery, he was sent by the Government to Constantinople to instruct the Turks in this branch of the service. A journey through Asia Minor in 1800 to join the English fleet at Cyprus inspired him with an interest in antiquarian topography, which he had afterwards frequent opportunities of gratifying. In 1801, after travelling across the desert to Egypt, he was, on the expulsion of the French, employed in surveying the valley of the Nile as far as the cataracts, but having sailed with the ship engaged to convey the Elgin marbles from Athens to England, he lost all his maps and observations when the vessel foundered off the island of Corfu. Shortly after his arrival in England he was appointed to survey the west coast of Albania and the Morea, with the view of assisting the Turks against attacks of the French from Italy, and of this he took advantage to form a valuable collection of coins and inscriptions, and to explore many ancient sites. In 1807 he was made prisoner at Salonic; but, obtaining his release the same year, he was sent on a diplomatic mission to Ali Pasha, whose confidences he completely won, and with whom he remained for more than a year as the representative of England. In 1815 he retired from the army, in which he held the rank of colonel, devoting the remainder of his life to topographical and antiquarian studies, the results of which were given to the world in the following volumes:—*Topography of Athens*, 1821; *Journal of a Tour in Asia Minor*, 1824; *Travels in the Morea*, 1830; *Travels in Northern Greece*, 1835; and *Nismata*

chiefly from the East Indies, the Cape, North Africa, South America, Mexico, Asia Minor, and the hilly regions of Europe. Seal skins, obtained from the arctic regions, are an important material, while hog skins are of value for the purposes of the tanner almost exclusively for making saddle leather. Among the skins which are only occasionally or locally used may be enumerated wolverine, rhinoceros, hippopotamus, and elephant hide, yielding very thick leather used for buffing wheels in cutlery manufacture, &c. and the skins of the numerous species of deer and antelope, dogs, kangaroo, and other Australian marsupials, porpoises, alligators, and occasionally bosa.

Structure of Skin—All hides and skins are externally clothed more or less with wool, hair, bristles, or scales. The skin itself has a thin superficial horny and cellular layer, the cuticle or epidermis, into which neither nerves nor blood-vessels penetrate. This layer is, during the life of the animal, continually in progress of peeling off in the form of small flat scales, and is renewed from the inner portion of the epidermis known as the *rete mucosum* or Malpighian net. The skin proper (*corium, dermis, or cutis*), which is the only portion of the hide of use for the tanner, consists of a dense plexus of fibrous bundles, knit together and interwoven in every direction, the interspaces being filled up with an albuminoid substance. The bundles of fibres terminate on the upper surface of the corium in separate masses, producing the irregularly papillated appearance seen in the "grain" of leather, and hence that surface is distinguished as the grain side in contradistinction to the flesh or under side. Chemically the connective tissue or fibrous portion of the corium consists of gelatinous tissue or collagen, which, according to Reimer, is similar in composition to the fibrin of silk. It is insoluble in cold water, weak acids, and alkalis, but with boiling water it dissolves, forming gelatin, and it is also soluble in concentrated acids and alkalis. It combines with tannic acid, forming the essential basis of leather, and it similarly combines with oils and fats. The inter-fibrous binding albuminoid material called by the same authority corin is soluble in alkaline solutions (being withdrawn from the skin by treatment with lime water, &c.) and in strong hydrochloric acids, but insoluble in water. It is precipitated from solutions by tannin, with which it combines. Many competent authorities maintain that the distinction between the fibrous and non-fibrous portions of skin is only one of physical condition.

Tanning Materials—Tannin or tannic acid is a product of the vegetable kingdom, abundantly formed in a very large number of plants, and secreted in such diverse organs and members as the bark, wood, roots, leaves, seed-pods, fruit, &c. The tannin obtained from various sources is not precisely the same in its chemical relations and reactions. Dr Stenhouse was the first to insist on the principal distinction which possesses practical interest to the tanner. He pointed out that tannin-producing bodies may be divided into two classes, the first class comprising such as by their decomposition develop into gallic acid, and by destructive distillation yield pyrogallol acid. Of these gallo-tannic acid, obtainable from galls, is the type. The other principal tanning materials which yield gallotannic acid are sumach, valonia, divi-divi, and myrobalans. The second class embraces tannins which do not resolve themselves into gallic acid or yield pyrogallol acid, and of this class oak bark, mimosa bark, and gambier yield characteristic types. All varieties of tannin, however, agree in possessing a powerfully astringent but not bitter taste, and a distinctly acid reaction; they yield with solutions of salts of peroxide of iron a deep blue-black or green-black solution, and particularly they combine and form insoluble compounds with gelatin and with the gelatinous

tissue which constitutes the principal portion of animal skins. By the action of ether, containing a little water, on gall-nuts, pure gallotannic acid may be procured. The ethereal solution separates by repose into two layers, the lower one, which is of an amber colour, being a solution of tannin in water, while the upper layer contains gallic acid, mixed with other substances. On gently evaporating the aqueous solution, nearly pure gallotannic acid is procured, to the extent of from 35 to 40 per cent., from galls. Obtained in this way, it is a shining, porous, uncrystallizable mass; it is soluble in water, and then exerts the properties of an acid. By exposure to air it absorbs oxygen and gives off carbonic acid,—two new products, gallic acid and ellagic acid, being formed at the expense of the tannin, the latter is insoluble. Gallotannic acid may be precipitated from its solutions by sulphuric and some other acids; by boiling the precipitate with sulphuric acid for a few minutes in a dilute solution of the same acid, gallic acid is formed, and crystallizes in cooling. Gallic acid also exists ready formed in gall-nuts, sumach, valonia, tea, and other substances. It does not combine with gelatin, and is therefore useless in tanning. Some tanners, however, imagine the gallic acid of the waste liquor to be useful in swelling or raising the hides, preparatory to removing them to a stronger liquor.

Tannin is in no case isolated for use as a tanning agent. It is only brought in contact with skins and hides by the medium of infusions, decoctions, or extracts of the various tanning materials in which a percentage of tannin is present mixed with colouring and other extractive material.

The substances enumerated below comprise the principal tanning materials in use throughout Europe and America.

Oak Bark—In early times the bark of the common oak, *Quercus Robur*, was almost the only tanning material used by British tanners, and it still is the substance from which the highest quality of heavy tanned leather is prepared, although the process is necessarily tedious. Throughout the country there are still a few tanners of sole leather whose boast is that they use nothing but oak bark. The entire supply of British oak bark is estimated at from 800,000 to 800,000 tons annually. This quantity, with the additional import of 80,000 tons from the Continent, is altogether inadequate to meet the demands of the tanners, apart from the necessity which is now felt for forcing the tanning operation much more rapidly than was formerly the rule. The most useful bark is obtained from coppice wood of about twelve years' growth, although in milder bark of longer growth a large proportion of tannin is secreted. The amount of astringent matter in coppice bark may be taken to average from 8 to 10 per cent., but the statements of the quantities of tannin in different samples vary within wide limits, as much as 18 per cent. being in some cases found. There is no doubt that the peculiar excellence of the sole leather of England is due in great measure to the superior oak bark produced there. Oak bark imparts firmness and solidity to leather, while other sorts give softness, thus the peculiar softness of French curried leather is referred to the bark of the evergreen oak, with which the better kinds are tanned, while the other tanning materials next to be named give each its peculiar quality with respect to colour, scent, toughness, or the power of resisting moisture and decay.

Other species of oak also yield tanning materials of much importance, and are extensively used. The cork oak, *Quercus Suber*, of south Europe and north Africa, in addition to its well-known external layer (the cork of commerce), possesses a fibrous inner bark, which is richer in tannin than ordinary oak bark. It is much employed in France, and is imported also to some extent into the United Kingdom. In the United States several varieties of oak yield staple tanning materials. Of these the principal are the rock or chestnut oak, yellow oak or quercuton, both important sources of tan barks, the red oak and white oak are of less consequence.

Mimosa Bark—Under this general name a large amount of bark comes to the English market from Australia, principally from Melbourne and Adelaide, and from Tasmania. It is obtained from a large number of trees belonging to the genus *Acacia*, widely distributed throughout Australia, and the various barks are rich in tannin, which ranges from 15 up to 32 per cent. The qualities imported into England are the richer kinds. They amount to about 80,000 tons annually, and may be assumed to contain on an average 25 per cent. of astringent matter. These richer barks are the produce of *A. acuminata*, a dense tree, the blue wattle (*A. mollissima*), the gold wattle (*A. pycnantha*), the silver wattle of

Tannum (*A. leucophylla*), and *A. cynanophylla*. The red colour of minous bark produces a dark leather, against which there is a prejudice, and the material has therefore to be used sparingly in mixtures. It is also said that minous tanning results in a somewhat hard brittle leather.

Hemlock Bark is the most important tanning material in North America. It is the produce of the hemlock spruce, *Abies canadensis*, which grows in vast forests throughout Canada, and the northern and eastern States of the Union, the principal bark-producing States being Pennsylvania, Michigan, and Wisconsin. Hemlock bark is obtained by cutting down the trees; and, as no provision is made for renewing the denuded forests, the demand for this more accessible portion of the American forests is already beginning to make itself apparent. The bark contains 7 or 8 per cent. of tannin, and the leather it makes has a strong reddish-brown colour. A large and increasing amount of hemlock extract, an impudenced decoction of the bark having a specific richness in tannin, is now imported into Europe, principally to the United Kingdom.

Among barks used to a limited extent and for special purposes are *larch* and *Scotch fir barks*, used for tanning sheep skins into baals, &c. *Willow bark* is used in Russia for tanning russa leather. *Mangrove bark* (*Rhizophora Mangle*), which is exceedingly abundant in India, and rock in tannin, have been used in the United Kingdom, but their use did not prove satisfactory.

Wood—Quebracho wood (*Aspidosperma Quebracho*), a wood rich in tannin, obtained from the river Plate, has recently grown rapidly in favour as a tanning substance in the United States and France, and is now coming into notice in the United Kingdom.

Fruits—Under this head are comprised valonia, myrobalans, and divi-divi, three substances which now play an important part in tanning both in Europe and America. *Valonia* consists of the imbricated acorn cups of a species of oak, *Quercus Agrifolia*, which is indigenous in Asia Minor, Greece, and southern Turkey, and is mainly shipped from Smyrna. It contains as much as from 40 to 45 per cent. of tannin, and the average annual imports into the United Kingdom are now not less than 30,000 tons. *Myrobalans* are the dried immature fruit of species of *Ternstroemia*, principally *T. Bellieria* and *T. Chalcidica*. They vary in size and colour, but in general they are oval hard wrinkled nuts rather like a filbert. The amount of tannin they yield varies from 20 to 35 or sometimes as high as 40 per cent. *Myrobalans* grow abundantly throughout India and are largely and increasingly exported from the three presidencies to the United Kingdom. **Divi-divi** (*g v*) consists of the bark of a species of *Sida* from the East Indies, which is used in tanning with divi-divi is subject to several grave objections. The abundant mucilage of the pods ferments readily, and thereby sometimes causes a rotting of the hides. Leather tanned by divi-divi also dries moisture readily in presence of damp, while in a dry atmosphere it is hard and horny, and further this agent leaves finished leather very dark in colour.

Leaves. **Sumach**—The leaves of various species of *Rhus*, under the name of sumach, or sumac, form materials of the first importance for the tanning of light skins in which it is essential to have a fine white colour, as in the case of light morocco leather, &c. Of the species the most important is the Shellen sumach, *R. Coriaria*, a shrub or low tree indigenous to Italy, Spain, France, and the Mediterranean coasts of Africa. It is cultivated with much care in Sicily, the leaves being gathered from shoots not more than a year old, which thereafter are cut down close to the parent stem. The same shrub is largely cultivated in the southern departments of France, in Spain, and in Portugal. The leaves gathered in June are dried and ground under edge rollers to a fine dust, in which condition the material comes into the market. It has a bright olive green colour with a tinge of red, and should contain in the best qualities from 25 to 30 per cent. of gallicotannic acid, and the same tannin which is present in galls. The leaves of the Venetian sumach, *R. Cotinifera*, are similarly used in the eastern countries bordering on the Mediterranean. In America a large quantity of sumach for tanning is obtained from two species of *Rhus*, *R. copallina* and *R. glabra*, growing principally in Virginia, the Carolinas, Georgia, and Alabama. These are, however, much inferior to European sumach, both on account of the colour they communicate to leather, and also from the smaller percentage of tannin they yield, although it is believed that with careful cultivation and proper attention the quality might be greatly improved.

Bark-acts—**Cutch** and **Gambir**, vegetable extracts obtained from the East, are frequently confounded, and in commerce they indifferently pass under the name of terra-japonica and catachu (see CATACHU, vol. v. p. 220). Gambir, which comes almost exclusively from Singapore, is the inspissated juice of the leaves of *Merris Gambir*, a tall shrub belonging to the natural order *Rubiaceae*. The extract comes into the market in the form of cakes about an inch in size, of a dull brown earthy appearance. In composition and properties it agrees with Cutch. The exports from Singapore amount to about 10,000 tons annually. **Kuto** (*g v*) is exceedingly rich in a variety of tannins, but its high price precludes its use in tanning. These extracts are used in tanning only in conjunc-

tion with other materials; they not only hasten the operation, but, judiciously used, they tend to render the leather soft and mellow.

Galls—Although galls are among the richest of all bodies in tannic acid, they do not form an important item among the materials of the tanner, being most valuable for other industrial purposes, and therefore too costly for use as tanning agents. The "knoppen" galls of Hungary, which are formed on the acorn cups of a species of oak, however, are to some extent used in Continental tanneries. For full information regarding galls, see vol. x. p. 43.

It is to be noted that most of the tanning substances above alluded to may be and are used in dyeing as well as for tanning.

Grinding and Leaching of Tanning Materials.—Bark, valonia, myrobalans, and other tanning bodies are reduced to a small and as far as possible uniform size by means of grinding or comminuting machinery. The main object in such machines is to produce uniformity of size with as little dust as possible, and the apparatus most commonly used is similar in principle to the ordinary coffee-mill, with breaking arms for the bark and segmental cutters for smaller materials. Various forms of disintegrator are also used, which produce their effect by violent concussion obtained by the revolution in opposite directions of two large and strong disks armed with projecting spikes on the sides of the disks facing each other. These disks are enclosed within a stout iron drum; and, as they revolve at a speed rising to three thousand revolutions per minute, some conception of the violence with which the tanning materials are struck and smashed may be formed. The tanning materials so prepared are next leached, latched, or infused for preparing the strongest tanning solutions for use in the "layers" or lay-away pits noticed below. In making these leaches or infusions, some tanners use hot (even boiling) water, others use cold water alone; some employ only pure water, and by some the weak and exhausted oozes or wooses from the pits are strengthened up by renewed leaching. The sole object of the tanner is to obtain the greatest amount of the tanning principle contained in the materials operated on, and to take care that what he gets is not lost or wasted. The method of leaching commonly adopted in the United Kingdom is to pass the bark through a series of leachers or spender pits. New or fresh bark is put into the first of the series, and over it is pumped cold the well-strengthened ooze from the next leacher. In this first pit the ooze or infusion is brought up to the full strength required for the lay-away tan-pits, and after the infusion is pumped off the tan (now somewhat reduced in strength) is passed over into No. 2 leacher, where it is treated with liquor in its turn also somewhat lower in strength. In this manner the bark passes by stages through a series of pits, diminishing in richness in tannin at each stage, and in the same gradual manner being infused in a weaker and weaker liquor, till in the last of the series it is fully exhausted with pure warm water. Thus pure water is put in at one end of the range and fresh tanning material at the other; the water as it ascends is gradually strengthened till it reach the maximum richness in tanning principle, while the tanning material as it descends is in like proportion deprived of its extractive constituents, till in the end nothing further soluble remains. From the last pit the bark, &c., are tuned out as "spent tan," usually to be burned in a special form of tan-burning furnaces for raising steam. The use of leaches or infusions was first insisted on by Seguin about the end of the 18th century, and the adoption of his suggestion led to the shortening of the time occupied in tanning heavy leather by about one half.

Testing Tan Liquors.—The methods by which the tanning value of any substance is determined are numerous, but few of them are at once capable of simple application and minutely accurate. One of the commonest plans for ascertaining the strength of the tan liquor technically called ooze, or woose, is by means of a kind of hydrometer called a

barkometer. It is graduated to the standard of pure water, and, when it is placed in a specimen of ooze, the strength of the latter is judged of by the position of the stem above or below the water-mark. But, as bark or other tanning material may contain several soluble substances besides tannin, the barkometer obviously cannot be relied on. Some farmers judge of the strength of ooze by its astringency to the taste. Seguin, who in the end of the 18th century was the first to insist on the advantage of tanning with previously prepared infusions, proposed the use of a solution of gelatin as a test of the presence of the tannin. In trying the quantity of tannin by Seguin's process, 480 grains of the bark in coarse powder should be acted on by half a pint of boiling water. The mixture should be frequently stirred, and suffered to stand twenty-four hours, the fluid should then be strained through a linen cloth, and mixed with an equal quantity of solution of gelatin, made by dissolving glue, jelly, or isinglass, in hot water, in the proportion of a drachm of glue or isinglass, or six table-spoonfuls of jelly, to a pint of water. The precipitate should be collected by passing the mixture of the solution and infusion through folds of blotting-paper, and the paper exposed to the air till its contents are quite dry. Every 100 grains of precipitate contains 40 grains of tannin nearly. As, however, some kinds of tannin produce larger precipitates of gelatin than other kinds, and as the composition of tanno-gelatin varies with the strength both of the solution of gelatin and of tannin, this method is not reliable. Sulphate of cinchonin is said to afford a better test, a solution of this, acidulated with a few drops of sulphuric acid, will, it is said, precipitate tannin completely from the solution. Lowenthal's method, founded on the fact that solutions of tannin in presence of sulphuric acid are readily oxidized by permanganate of potash, is very useful for the comparative determination of the value of different tanning substances. A given weight of tanning material is infused, and the solution is brought up to a definite volume. One half of this measured quantity of tannin solution is mixed with definite quantities of a standard indigo-carmin solution and sulphuric acid, and to this mixture permanganate solution is added from a graduated tube till the colour of the indigo is completely discharged, when both tannin and indigo are oxidised. A parallel experiment is next made with similar measured amounts of indigo and sulphuric acid solutions, but without any tannin infusion. The difference between the quantity of permanganate required to discharge the colour in the two experiments gives the standard for calculating the amount of tannin in the solution to be tested. Another good method of testing the value of tanning material is to digest a piece of dry prepared hide or skin in a known quantity of the infusion, until the whole of the tannin and other matters be separated. The skin is then taken out, slightly washed, dried, and weighed, when the increase of weight is supposed to be the weight of tannin and of the other matters required. An apparatus devised by MM Muntz and Ramepacher has recently been introduced for facilitating this last test. It consists essentially of a small vessel sufficient to hold a measured quantity of a tanning infusion, the specific gravity of which is carefully ascertained. That vessel is so arranged that strong pressure can be brought to bear on it by means of a screw acting on an india-rubber surface, thereby forcing the liquid through a piece of skin which covers the lower part. The skin absorbs the whole of the tannin during the passage through it of the infusion, and by ascertaining the specific gravity of the escaped liquor the percentage of the tannin material in the infusion can be readily determined. This apparatus has been extensively introduced in practice in England and on the Continent.

Sole Leather, or Heavy Leather Tanning.—The hides of oxen are received in the tan-yard in four different conditions. These are—(1) market or slaughter hides, which, coming direct from local abattoirs, are soft, moist, and covered with dirt and blood, (2) wet salted hides, (3) dry salted hides, and (4) sun-dried or "flint" hides,—the three last forms being the condition in which the imports of foreign hides are made. The first operation in the tannery is to clean the hides, to free them from salt, and to bring the hard dry hides to the uniformly soft flaccid condition in which all market hides are obtained. The treatment at this stage requires skill and attention to prevent the more soluble constituents of the hide from dissolving out in the washing and soaking processes, and also to secure the complete softening of the entire substance, upon which the successful tanning greatly depends. In the case of market hides cleaning and softening are principally effected by washing and soaking in spent lime-water, while for dry hides and dry salted hides brine is essential. The softening of these materials is helped and rendered thorough by working them for some time in the stocks (fig 1) after they have been well soaked. After being thus brought

FIG. 1.—Double-acting Stocks

to throw the hide or skin into a strong watery ley of slaked lime, with lime in excess. By this, in a few days, more or less according to the proportion of lime present, the hair is easily detached, the hair-sheath having been dissolved. The hair was formerly taken off by making a sour liquor from fermented vegetable matter, in which the hides lay for several days, they were also smoked in a damp state for the same purpose, but both those methods are now abandoned. They are still sometimes, especially on the Continent, sweated, that is, they are laid in heaps and kept wet and warm, a plan which is still adopted in England for skins. In America the sweating is performed cold; the hides are hung up wet in a damp underground cellar, and are kept moist for ten days or a fortnight. In either of these sweating processes incipient putrefaction takes place sooner or later, when the hair and scarf-skin are easily removed; but the fatty matter remains, and in some cases prevents the hide from taking the tan.

There have been numerous other methods proposed and patented for unhairing skins, few of which have been received with much favour. Among the agents proposed may be mentioned caustic soda, sulphide of sodium and sulphide of calcium, borax, sugar, and charcoal—substances which it is obvious must act in very different manners. Lime and alkaline solutions not only loosen the hair and scarf-skin, but also "plump" the corium or true skin, that is, they swell it and render it consequently porous and more permeable to the tanning solution. Lime further forms with the fatty matter of the flesh and calcareous soap, thus neutralizing the fat which would otherwise interfere with

the tannin. Some tanners, especially Americans, who work the so-called acid process, plump their hides by the use of sulphuric acid, hanging them six or eight hours in a solution containing $\frac{1}{10}$ th of acid. The plumping is sometimes done as a preliminary operation, and again others add the acid to the colour pits, or the first pit into which the hides go for the tanning process. Among non-acid tanners the plumping of sweat stock in which there is no lime is secured in the weak acid liquors of the colouring and handling pits. In the case of limed stock the hides, at the proper stage, are withdrawn from

FIG. 2—Tanner's Beam

the pits and stretched over an unhairing beam (fig. 2), when with a working knife (fig. 3, a) a workman partly scrapes partly shaves off the hair and scarf-skin. Another workman in a similar way with a fleshing knife (fig. 3, b) removes the fatty compounds and flesh from the flesh side.

For these operations several machines have been adopted, working mostly with revolving knives or cutters, under which the hides or skins pass in a fully extended state. Such machines are, however, only applied to the smaller skins. The next step in the preparation of the hide is to remove from it as thoroughly as possible all traces of lime. This is partly accomplished by going over the hide on the beam with a scudding knife, pressing the combined lime and interfibrous matter out of the tissue. For more complete neutralization of lime in the larger hides the influence of the weak acid of the colouring pits is trusted to. Harness hides are washed by some means in pure water, the most convenient and generally adopted method being to place them in the dash wheel (fig. 4), in which they revolve and tumble about whilst fresh water is continually being poured on them within the revolving wheel.

The hides now come to be trimmed and prepared for tanning in the shape in which they are intended ultimately to be sent into the market. An entire untrimmed hide (fig. 5) is termed a crop; a side is half a crop, the dividing line of the two sides being shown at EF, a butt is the back portion ABCD, and a bend is half a butt ABFE. G, G are belly pieces, and H, H the cheeks, both together

FIG. 3—Tanner's Knives and Pin.

FIG. 4—Dash Wheel

being the offal. When the shoulder (the upper part of the butt) is removed, what remains is a short butt.

The actual tanning now commences, and the operations involved may be divided into a series of three—(1) colouring, (2) handling, and (3) the laying away. The

FIG. 5—Divisions of a Hide

a series of four or six, this stage usually occupying about a week. As the hides are moved forward in the series they are exposed to a liquor containing a small and steadily increasing proportion of tannin, and this, it may be said, holds good till the hide reaches the last lay-away pit, in which the tanning is completed. The objects attained in the colouring pits are the superficial colouring or dyeing of the hide, some amount of plumping from the acids of the ooze, and a dissolving out of remaining traces of lime, principally by the acetic acid to which the hide is exposed. After colouring, the hides pass on to the handlers or handling pits, a round or series of which may consist of from four to twelve, according to the mode of working. In the handlers the hides are spread out horizontally; and in the first series they are "handled" once a day or more frequently if convenient. The handling consists of hitting the hides out of the pit by means of a tanner's hook (fig. 6), pulling them on the side till they drain, and returning them into the pit, the hide on the top in one handling going to the bottom in the next. This operation is continued throughout the series, only as the hides advance the necessity and advantage of frequent handling decreases, while the strength of the tan liquor in which they are handled increases. The whole handling stage consumes on an average about six weeks. Finally, the hides are carried over into the lay-aways or lay-downs. In these the stock is exposed to the strongest tanning liquors, and between the hides thin layers of the tanning bark or mixture are shown. The object of this interstratification is to separate the mass of hides so as to secure the more ready permeation of the entire mass by the liquor, and also to feed and strengthen the ooze itself as its tannin is absorbed by the hides. In these lay-aways the hides are allowed to rest for about six weeks, after which the pits are cleared out, charged with fresh ooze, and filled with the hides and tan as before. These processes may be repeated three or four times before the tanning is completed. When the process is deemed complete, each hide, on being taken out, will be found to be converted into leather, and a portion of its gelatin which has been dissolved from its interior is, by combination with a portion of tannin from the strong solution, deposited upon its surfaces, where it is found in the form of a yellow deposit, technically known as bloom, or pickling, which disguises the under colour of the leather just as if it were covered with yellow paint. This, prejudice says, must be on its surface, or it is not saleable, but it is so much quality and weight lost to the

FIG. 6—Tanner's Hook
(without handle)

consumer, as he pays for it on the outside of his leather to be worked off in the dressing and currying operations. By some tanning agents—mimosas, for example—there is little or no bloom deposited.

The theory of the formation of the bloom is this. As soon as ozone has penetrated into a hide it loses its tanning material, but by capillary attraction is detained, this exhausted ozone acts by imbecation on the finer and more soluble interstitial gelatin, and dissolves it. In handling, about one-twelfth of this flows out, the remaining eleven-twelfths accompany the hide into the next stronger solution, of which only one-twelfth is absorbed directly, and a small portion is slowly exchanged by endosmosis and exosmosis. The small portion of strong solution which passes into the pores of the hide contributes to tan the hard fibrous portions not dissolved, and the small portion of weak solution passing out of the hide by exosmosis gives up its dissolved gelatin to the tan of the stronger solution outside to form tannate of gelatin, which partly adheres to the surface as bloom, and partly falls to the bottom of the pit as pitching.

From the time when the raw or hide is taken in hand till the leather is fully dried, not less than a year is consumed in the case of the best qualities of sole leather. It was formerly the practice in England, as it still is on the Continent, to tan by the process of *stratification*, for which purpose a bed of bark is made upon the bottom of the pit, upon this is laid the hide, then bark, then a hide, and so on until the pit is full, water is sometimes pumped in, and the pit left for some months, it is then emptied, and the same hides returned with fresh bark and water for a few months longer, this is repeated again and again, until the tanning is completed, the time varying from one to four years for heavy leather.

The devices and processes which have been proposed and to some degree put in operation with the view of shortening the time consumed in tanning are beyond all enumeration. In scarcely any case have time-saving processes proved successful in practical working, so far as the production of good leather is involved, and now the opinion appears to be completely established that for the thorough tanning of heavy leathers, a slowly operating machine and consequently long time are essential. The devices for the hastening of tanning have for the most part turned upon some plan for forcing the tan liquor into and through the hide, or for alternate soaking and squeezing of the hides. Among the plans which have been tried on a commercial scale may be enumerated tanning by the application of hydrostatic pressure to force the liquor through the hides, a method which failed simply because the pressure was equal on both sides. The vacuum tanning principle is another which has been extensively tried, only to result in disappointment. It consists in hanging the hides in a pit or cylinder so constructed that the air can be exhausted by an air pump, after which the hides are forced into the vessel and readmitted, and again withdrawn. Hides, however, loaded with water swell little under diminished atmospheric pressure, and the practical difficulty of procuring and maintaining a vacuum in tan pits is very great. More promising results have been obtained by setting up in tan pits the physical process of endosmosis and exosmosis. This is done by sewing up hides two and two in bags which, being filled with solution differing in specific gravity from the tan liquor in which they are immersed, thereby set up transpiration through the hide. This process failed chiefly through the brittleness of the leather if cykled. A plan of sewing hides into bags and suspending them filled with strong tan liquor, which as the fluid exuded was renewed, was also tried for some time. Again, it has been attempted to keep the hide suspended stationary in the pits and move the liquors instead of carrying over hides from one pit into another. A more recent device, which may not yet be fully tested, consists in keeping up the strength of the liquor by a continuous circulation through pipes from the stronger into the weaker liquors. By this system of circulation, instead of the osmoses in which hides are immersed becoming weaker and weaker the longer they rest in the liquor, the osmosis is kept up at least to its original strength, and it may indeed, if desirable, be increased in proportion as the tannin combines with the hide.

Heavy hides for sole leather, belting, and similar purposes do not require to undergo any elaborate dressing or currying. When finally removed from the tan pits they are piled grain to grain and flesh to flesh to drain, cure

being taken that no tan liquor is allowed to lurk in the pile, which is covered over from the light. When sufficiently drained, they are brushed or scoured to free them from adhering impurities, and removed to the drying loft, where, after lightly rubbing over with oil, they are hung on poles to dry. In the loft steam-heated pipes keep a dry atmosphere during winter, and enable the attendants to regulate and control the drying of the leather. The leather when dried in this condition is rough tanned, and for finishing as sole leather it has to be struck out or "pinned" and compressed by rolling. For striking or pinning by hand the hide is dampened with water, thrown over a beam, and worked all over the grain side with a striking pin (fig 3, c). This operation smooths and levels the grain, removes smaller wrinkles, and to some extent compresses and solidifies the leather. Striking machines (fig 7) are now very generally used for the operation.

FIG 7.—Leather Striking Machine

These consist of a drum or cylinder having a parallel series of projecting knives, or plates of gun-metal, set angularly across its surface. Underneath the drum is a brass bed, fixed on a yielding cushion, which can be pressed up or eased by means of a foot lever, according as the leather operated on is thick or thin. The drum is made to revolve at a very rapid rate, the blunt edges and external angles of the knives thereby striking the surface of the leather with great violence, and thus the grain is struck out, smoothed, and compressed in a very rapid and efficient manner. Finally, the leather is rolled and compressed on a level zinc-lined wooden bed by a heavy hand roller, such as is shown in fig 8, or on the platform of one of the numerous forms of machines designed for that purpose.

FIG 8.—Hand Roller

The yield of leather from a given weight of dry hide varies very much according to the different styles of tannage and materials used. As a mean outcome, it may be said that 100 lb of green hide, tanned with from 300 to 400 of oak bark, will yield 40 to 50 lb of leather, 100 lb of green hide, however, when deprived of hair, flesh, and moisture, will weigh only 18 lb, and, taking 100 lb of dry hide, which, fleshed and unhaird, weighs 85 lb, the yield of leather will be from 180 to 200 lb according to tannage.

The percentage of tannin alone absorbed from different tanning agents has been found to be for hemlock, 64.3, pine, 90.8, chestnut, 85.2, oak, 76.9, oak, three years in pit, 70.2. Heavy leathers, being sold by weight, are subject to adulteration, and have fictitious weight given them without any benefit to the material, but rather the opposite, by impregnation with such salts as sulphate of magnesium or chloride of barium, or with glucose, the last being the most frequently used adulterant.

Upper Leather—Under this head are included the thin, soft, and pliable leathers which find their principal, but by no means exclusive, application in making the uppers of boots and shoes, which may be taken as the type of a class of leathers. Upper leathers are made from such hides and skins as East Indian kips, light cow hide, calf skins, horse hide, and also from split heavy hides. The preparatory dressing of such skins, and the tanning operations, do not differ essentially from those already described. In proportion to the thinness of the skin treated, the processes are more rapidly finished and less complex, while at the same time the skins absorb a large percentage of tanning extract. The time used for unhairing must be removed in the preliminary stage, with greater thoroughness than is essential in the case of hides for sole leather, and for this purpose the skins are washed in the dash wheel, and undergo a process of *bating* or *graining*. A quantity of pigeon's dung is dissolved in water, and in this the hides are steeped for a week or ten days, with occasional removals and striking. The theory of this process is obscure, but it has been explained on the supposition that the muc acid of the dung removes the excess of lime, and that the ammonia generated by the putrefaction of the mixture tends to form an ammoniacal soap with any remaining fat of the hide, but as the gelatin of the hide exists in two states,—one the principal, hard, or fibrous portion, and the other (which is more soluble) contained between the fibres, and more affected by agents and putrefaction—this softer portion is removed by graining, and the leather, when tanned, is light and porous, and more readily permeable by water. Small skins are not fitted one by one out of the colouring and handling pits, but the whole contents of the pits are tied together, so that when the upper skin is seized it is thrown over a spoked cylinder erected between each pair of pits, and the wheel being set in motion, the entire string of skins comes up over its surface and is passed into the neighbouring pit with the utmost rapidity. Such an apparatus is used for handling all small pieces and fragments, as for example the cheeks and bellies of heavy hides.

The time occupied in tanning an upper leather, say an East Indian kip, with a mixed mimoso, sumach, valonia, and tannin, may be about three months. In the fine tanning of calf and kip skins on the Continent, for which French and German tanners are famous, the duration of the operation may be from four to eight months.

Splitting—In the preparation of most kinds of upper leather, the hides are split into two, or three, and sometimes more portions. In the case of a single split the portions form a grain and flesh side, when three sections, or slices, are made they result in grain, middle, and flesh splits. Some tanners split their hides in the green condition, others after colouring, and in many instances the splitting is done, after the leather is fully tanned, by the currier, as a regular part of his operations, this being particularly the case with imported tanned East India kips, and other fully tanned leather of foreign origin. Splitting machines will be alluded to in connexion with the operations of currying.

Currying—Leather as it leaves the tannery is a comparatively rough, harsh, and intractable substance, and the duty of the currier is to dress and otherwise fit it for

the use of the shoemaker, coachbuilder, saddler, and the numerous other tradesmen who work in it. The currier has to smooth the leather, so to pare it down as to reduce inequalities of thickness, to impregnate it with fatty matter in order to render it soft and pliable, and to give it such a surface-dressing, colour, and finish as will please the eye and suit the purposes of its consumers. The operations of currying are complex and varied, each particular class of goods receiving a treatment in many respects peculiar to itself. The fact also that machinery is used by some curriers for nearly every mechanical operation, while others adhere to the old manual system, renders it almost impossible to give in brief an outline of operations which will be consistent with the practice of any considerable number of curriers.

Regarding currying as principally a handicraft, the following may be taken as an outline of the range of operations for the preparation of a waxed calf leather, the commonest form of upper leather in use. The leather is first made pliable by soaking in water, after which it is shaved on the flesh side, and a tolerably smooth surface is produced. This operation is carried on at a beam, or strong frame of wood, supporting a stout plank faced with lignum vitae, and set vertically, or nearly

Fig. 9—Currying Knife

so. The knife (fig. 9) is a double-edged rectangular blade, about 12 inches by 5 inches, with a straight handle at one end, and a cross handle at the other in the plane of the blade. The edges of this knife are first made very keen, and are then tuned over so as to form a wire edge by means of the thicker of the two straight steel tools shown in fig. 10. The wire edge is preserved by drawing the thinner steel

Fig. 10—Currying Apparatus. C, plank; R, raising board; S, slider

tool along the interior angle of the wire edge from time to time as required, for which purpose the man holds this smaller tool between his fingers, together with the beam-knife. The skin being thrown over the plank, the man presses his body against it, and leaning over the top holds the knife by its two handles, almost perpendicularly to the leather, and proceeds to shave it, shifting it from time to time so as to bring all the parts under the action of the knife, and frequently passing a fold between his fingers to test the progress of his work. The skin is then placed in hot water, and removed to a mahogany or stone table, to which the wet flesh side adheres, and is worked with a tool called a stretching-iron, or slicker S (fig. 10), consisting of a flat, rectangular piece of iron, copper, or smooth hard stone, fixed in a handle. With this tool a man scrapes the surface of the skin, exerting a strong pressure with both hands, and dashing water upon it from time to time, by which means lumps and inequalities are made to disappear, the leather is equalized, and extended, and the bloom is brought to the surface. The superfluous moisture and the superficial bloom are now *sicked* out, and a stuffing, or *dubbing*, of cod oil and tallow is rubbed into both sides of the skin, but chiefly the flesh side, by means of a brush, or with the woolly side of a piece of sheep skin. The skin is now dried in a loft, and, as the water only evaporates, the dubbing sinks into the pores. When dry enough for the

purpose, the skin is *boarded*, or worked with a graining board or pommel C (fig. 10), the effect of which is to bring up the grain, or give a granular appearance to the leather, and also to make it supple. The pommel is a piece of hard wood, grooved like a clamping-board, and attached to the hand by means of a strap, whence the word pommel, from the French *pommelé*, or palm of the hand. The leather passes through various manipulations, each having its distinct name, thus *graining* consists in folding the skin with the grain sides in contact, and rubbing strongly on the flesh side, *blissing*, or rubbing the extended skin on the grain side, *whitening*, or passing a knife with a very fine edge over the skin at the beam, so as to clean the flesh side preparatory to *waxing*, which is done just before the skins are sold; for at this point the currier stores his skins, as they can be kept best in the state of *finished russet*, as it is called, previous to waxing. Waxing consists of two parts: the first is the laying on the *colour*, or blacking of oil, lampblack, and tallow, which is well rubbed in on the flesh side with a hard brush, then, secondly, the skin is black-sized with stiff size and tallow, laid on with a sponge or a soft brush, and thoroughly rubbed with a glass slicker, a finishing gloss being given with a little thin size. The curried skin is now said to be *black on the flesh*, or *varnished*, in which state it is used for the upper leathers of men's boots and shoes. In the case of any of the numerous varieties of grained leather which are blackened and dressed on the grain side, the finishing operations are different. These are hard dried after slicking, and the operation of stuffing or dubbing is omitted. They are grained in the dry state, often by machinery, then boarded to soften them, and next blackened on the grain side with a solution of copraes. The flesh side is whitened or *stuffed*, and the grain is treated with sweet oil or some similar oil, and finally glazed with a thin solution of gelatin or of shellac.

For almost every operation in enying efficient machinery has now been adapted, the use of which not only modifies the operations of the currier, but also enables him to split up hides and to finish his splits in numerous of any kind of leather. He may desire to copy in a machine carrying the tanned hide, duly damped, are struck out in a "storing" machine. It consists of a strong oscillating arm or bar having a blunt steel blade fixed on its end, which works back and forward over a concave bed on which the hide is laid, and which by its scraping and striking action on the softened leather smooths and equalizes the grain, and produces a compact uniform surface on

FIG. 11.—Belt Knife Splitting Machine.

it. From the storing machine the hide may pass to the splitting machine, of which there are numerous forms, the American *splitter* with a fixed knife being the oldest and best known. A much more perfect machine, however, is the belt or band splitting machine. In this machine (fig. 11) the knife or cutter *a* is an endless band of steel which revolves at considerable speed with its cutting edges close to the sides of a pair of rollers through which the leather is fed and pressed against the knife. The lower of these rollers is made of short segments or rings, each separately capable of yielding to some extent so as to accommodate itself to the unequal

thickness of various parts of a hide. The thickness of the slice of leather to be cut is gauged to the utmost uniformity by means of the hand severs *b*, which pass at lower the upper roller. The knife edge of the cutter is kept keen by rubbing against revolving emery wheels *c* as it passes round. So delicately can this machine effect its work that slices of leather uniform throughout and as thin as paper can be easily prepared by it, and with its help it is an uncommon practice to divide a comparatively thin East Indian key into three useful splits. Another machine now largely used by curriers is the scoring machine (fig. 12), a level table or platform freely movable in all directions, having mounted over it a scumming cutting frame in which are fixed brushes and pieces of slate or flint

FIG. 12.—Scumming Machine.

stone. These, with a small jet of water, scum and level the entire surface of the leather lying on the platform, effectively removing all bloom and all scummy impurities. Other machines are used in stuffing, bluing, and whitening machines. In the latter the leather is pulled and equalized by the cutting action of a small cylinder armed with oblique cutting edges. The cylinder, moved to and fro with pendulum motion, and revolving at the enormous rate of from 3000 to 4000 revolutions per minute, passes and shaves the leather on the same principle as the lawn-mower cuts grass. Embossing or graining cylinders, bonding cylinders, glazing machines, emery wheels for finishing the flesh side of levant leather are all among the mechanical adaptations for curriers' use.

Patent or Enamelled Leather.—Leather finished with a brilliant, smooth, and glossy surface, used for dress boots and shoes, dress belts, and fine harness, is known under a variety of names, as lacquered, varnished, japanned, or enamelled leather, &c. Such leather is finished principally from tanned calf skins, and in more recent times from seal goat, and sheep skins, but lighter ox hides and horse leather are also japanned for special purposes. The finishing of leather in this style involves two processes—(1) the grounding or preparation of a smooth surface, and (2) the varnishing and polishing. The grounding material used by French and German harness-makers, who greatly excel in the production of such leather, consists of a thick syrup mixture of lamp-black with a varnish of boiled linseed oil, umber, and litharge. This is uniformly spread over the surface of the leather, which has been previously stretched and tacked on a wooden frame. The first coating is dried in the air, then exposed in the japanning stove to a heat of about 170° Fahr., and afterwards rubbed smooth with pumice stone. This process of coating, drying, and smoothing is repeated several times, and the leather is next varnished with a compound of boiled oil, Berlin blue litharge, and some dryer, thinned either with oil or turpentine or petroleum spirit. Two or three thin coatings of such varnish are given, the surface being carefully polished after each, but the composition of the varnishes &c., and the number of coatings applied, vary much in the hands of different manufacturers. Coloured enamel leather receive two preliminary coatings of oil, rosin, and spurt of turpentine, which are sun-dried, they are then brought up

with several coatings of oil, varnish, and the special colouring substance, and finished with a thin coat of copal varnish.

Seal Leather.—The tanning of seal skins is now an important department of the leather industry of the United Kingdom, in which this branch has been specially developed. The skins form one of the items of the whaling industry, which principally centres in Dundee, and at that port, as well as at Hull and Peterhead, they are received in large quantities from the arctic regions. A considerable number are also imported at Greenock from the coast of Newfoundland. The skin of these seals is light but exceedingly close in texture, and yields a very strong tough leather. The skins are prepared, split, and tanned in the same way as other light leathers, tanning with mixed oak bark and sumach usually occupying about six weeks. Seal leather is generally finished on the grain side as "levant" seal with a large coarse grain, and in that form it is principally used by bootmakers. A proportion of seal leather is finished as enamel and japanned leather.

Russia Leather was originally, as the name implies, a speciality of Russia, where it was made from the hides of young cattle, and dressed either a brownish-red or a black colour, for upper leather or for bookbinding, dressing cases, purses, and similar objects. Russia leather is now made throughout both Europe and America, the best qualities being obtained from Austria. Horse hides, calf, goat, and sheep skins, and even splits, are now finished as russia leather, but most of these are decidedly inferior in quality, and, as they are merely treated with birch bark oil to give them something of the odour by which an ordinary observer recognizes russia leather, they scarcely deserve the name under which they pass. Genuine russia leather is tanned like other light leathers, but properly in willow bark, although poplar and spruce fir barks also are used. After tanning, scouring, and setting out, the hides are treated on the flesh side with an empyreumatic oil obtained by the dry distillation of birch tree bark and buds, to which the peculiar smell of the leather is due. The red colour commonly seen in russia leather is given by dyeing with a preparation of brazil wood, rubbed over the grain side with a brush or sponge. Black-coloured russia leather owes its colour to repeated stainings with acetate of iron. The leather of genuine quality is very water-tight and strong, and, owing to its impregnation with empyreumatic oil, it wards off the attacks of insects.

Morocco and Thin Leathers.—Originally morocco leather was a product of the Levant, Turkey, and the Mediterranean coast of Africa, where the leather was made from goat skins tanned with sumach, and finished either black or various bright colours. Such leather was peculiarly clear in colour, elastic, and soft, yet firm and fine in grain and texture, and has long been much prized for bindings, being the material in which most of the artistic work of the 16th century binders was executed. Now, in addition to genuine morocco made from goat skins, we have imitation or French moroccoes, for which split calf and especially sheep skins are employed, and it may be said that, as the appearance of morocco is the result of the style of grain, which can be artificially produced on any leather, and of the finish, morocco can be made from all varieties of thin leather. The Germans distinguish between saffian and morocco, including under the former term leather tanned with sumach, and dyed bright colours without previous stuffing with fat, while as morocco proper they reckon leather which may be prepared with mixed tannage, is stuffed, and afterwards is finished black. Saffians are, according to this classification, the leathers principally used for bindings and fancy purposes, morocco being more especially devoted to shoe work.

The preparation of skins for morocco leathers must be

conducted with much care. The skins, being usually hard and dry when received, are first soaked and softened by milling in the stocks and working on the tanner's beam. They are next limed, unhaired, fleshed, and trimmed in effect as already described in the section on sole leather, and they are pured or bated in a preparation of dog's dung. After undergoing the influence of this preparation, the skins are washed and slated with a knife-edged piece of slate to remove from their surface fine hairs and adhering dirt, and then they are put into a druch of bran and water, heated to about 185° Fahr., after which they ought to be perfectly free from deleterious impurities and ready for tanning. Several processes are adopted in tanning, but that most approved is based on the original Eastern practice, which consists in first treating the skins with an already used sumach infusion. Next they are, in pairs, sewed up as bags, grain side outwards, and these bags are filled with concentrated sumach liquor and a proportion of powdered sumach, and by the exudation of the liquor through the skins, partly aided by pressure, the tanning is quickly completed. After ripping out, the skins are thrown into vats containing sumach liquor, to tan the edges and shanks, which are not reached by the liquor in the bags. The fully tanned skins are now struck out on the beam with the striking pin, and hung in the lott to dry, when they are ready for the finishing processes. A large proportion of the goat skins imported into western Europe from the East Indies, whence they are exported in enormous quantities, are received in the fully tanned condition, and ready for the morocco finishing operations, after a short treatment with sumach liquor. For finishing, the leather is first damped in soap-suds, and shaved on the flesh side to equalize the thickness of the leather, and next on a table worked over repeatedly with slickers, which renders the skin firm, smooth, and uniform. The skins are next blacked on the grain side with a solution of acetate of iron, and from this point the methods of finish diverge in an endless manner according as it is desired to finish the leather as "kid," "levant," "pebbled," "bright," or "dull," &c. The bright-coloured moroccoes are dyed in two different methods, the dyeing being done as a preliminary to the finishing operations. In the case of genuine moroccoes, the skins are dipped and drawn through small troughs containing the dye liquor; two skins are taken, placed flesh side to flesh side, and so worked through the liquor by hand, the operation being repeated as often as necessary to bring up the requisite strength of colour. Imitation morocco, on the other hand, is usually dyed by stretching the skins on a table and brushing the dye liquor over the grain side. After the dyeing the skins are shaved and dressed, the dyed surface is rubbed over with an emulsion of white of egg, luscied oil, and dye liquor, and afterwards grained and glassed, or finished smooth and glossy, according to the purpose for which the leather may be required. In recent times aniline colours have been very largely employed in the dyeing of all bright leathers.

In the tanning of sheep and lamb skins the general operations outlined above in the case of goat skins are necessary. Previous to tanning, the prepared skins are submitted to hydraulic pressure, to expel the oleaginous matter with which sheep skins are richly impregnated. Sheep skins tanned, generally with beech bark in the United Kingdom, and uncoloured are known as *banis*. *Roman Leather* is sheep skin tanned in sumach, coloured and dressed throughout in the same manner as imitation morocco, excepting that it is finished smooth and glassed. *Skivers* are split grain sides of sheep skins tanned in sumach, and similarly finished,—the flesh split being shayed for inferior qualities of shamoy or wash leather. Skivers from their thinness are quickly tanned through in a sumach

liquor, and in no case are they sewed into bags, as is most commonly the case with entire sheep and goat skins. The splitting machine used for split sheep skins has two rollers, the lower one of gun-metal and solid, and the upper made of gun-metal rings, while between the two rollers, and nearly in contact, is the edge of the sharp knife, to which an oscillating movement is given by a crank. When a skin is introduced between the two rollers, it is dragged through against the knife edge and divided, the solid lower roller supporting the membrane, while the upper one, being capable of moving through a small space by means of its rings, adjusts itself to inequalities in the membrane; where this is thin the rings become depressed, and where it is thick they rise up, so that no part escapes the action of the knife. Skivers are finished white, or in colours in variously lined or diced patterns, and in imitation grain, and are principally employed for hat and other linings and various purposes in which they meet little strain or tear and wear.

Danish Leather is tanned sheep and lamb skins principally, but goat and kid skins also are used. The tanning medium is willow bark, and the leather, bright in colour and highly elastic, is used for strong gloves. The same name is also applied to tawed lamb skins, dressed and finished on the flesh side.

Alligator Leather.—For a number of years leather tanned from the skins of the Mississippi alligator has formed an item in the trade lists of the United States, and it is now also being sought after in the European markets. The industry was started about the year 1860, and centred first at New Orleans, the raw skins being obtained from the rivers of Louisiana. Now, however, the skins are principally procured in Florida, and the tanning is a considerable industry in Jacksonville. The parts of the skin useful for leather making are the belly and flanks, and these portions alone are steeped in lime to preserve them for the tanner. Alligator leather, which has a scaly surface, is useful for fancy boot and shoe making, and for many small articles such as cigar cases, pocket books, &c.

Kangaroo Leather.—The Australian colonists have turned their attention to the preparation of leather from the skins of the kangaroo, wallaby, and other marsupials native to their continent. These skins are both tanned and tawed, the principal tanning agent being the mimosa bark, which abounds in Australia. The leathers they yield are of excellent quality, strong, and elastic, and rival in texture and appearance the kid of European tanners. The circumstance that the animals exist only in the wild state renders this a limited and insecure source of leather.

Tawed Leather

Under the term tawing is embraced the preparation of leather by the action of mineral substances on hides and skins. In the process of tawing the substance principally employed is alum or some of the simple aluminous salts, although many other mucous salts have been proposed, some of which have given considerable promise of practical success. The system of tawing is principally applied to thin and light skins of sheep, lambs, kids, and goats, although in former times much heavy leather was tawed for military belts, heavy gloves, machine belts, &c., for most of which purposes, however, sun-dried or similar leathers are now found more applicable and durable. The products obtained by tawing are of a pure white colour, whence the name white leather is frequently applied to goods of this class. The most important departments of the tawing industry are the calf kid manufacture for boots and shoes, and glove and lined leather tawing, the products of which are exclusively devoted to glove making. A large number of white tawed sheep skins are also used by druggists and perfumers as a base for leather for bottles, and for linings by bootmakers, &c.

Calf Kid.—The various steps of preparation through which the light skins suitable for the manufacture pass, in respect of softening, liming, unliming, purging, and drenching, are similar to the process by which morocco skins are prepared for tanning. The tawing itself is accomplished in a drum or cylinder the same as the carrier's stuffing wheel, into which is introduced for one hundred average skins a mixture consisting of 20 lb of alum, 9 lb salt, 40 lb flour, 250

eggs (or about 1½ gallons of egg yolk), 1 pint of olive oil, and 12 to 16 gallons of water. In this mixture, at a temperature of not more than 100° Fahr., the skins are worked for about forty minutes, by which action the tawing is completed. After the withdrawal from the drum the skins are allowed to drain, dried rapidly by artificial heat, dampened, stacked out by drawing them over a blunt steel tool, and then wetted and shaved down on the beam to the required thickness. Next they receive, if necessary, a second treatment with the tawing mixture. The dyeing or colouring follows, which in the case of calf kid is always black, the colour consisting of a compound of bichromate of potash, stale urine, logwood extract, and copraea. It is applied either by brushes on a table, or by dyeing the leather in small vats as in the parallel case of morocco leather. The dyed leather is washed with pure water, dried, grounded with a curious moon knife, stretched in all directions, ironed, and oiled on the flesh side with a mixture of oil, wax, &c.

Glaze Kid.—In the preparation of kid leather for gloves the tender skins of young kids alone are used for the best qualities, but for a large proportion of such leather young lamb skins are also tawed. The genuine kid leather is for the most part produced in France, specially at Annomy and Paris, while lamb kid is more particularly a product of Germany, Austria, and Denmark. In all stages of the preparation of this leather the utmost care and attention are required, and it is specially of consequence that the operations preparatory to tawing should receive thorough attention. The unliming is best effected by steeping the skins in a mixture of lime and oil of pomace, and, while the general sequence of unliming, fleshing, beating with dog's dung, scudding, washing, and treating with the bean drench, is the same as in the case of other skins, much more attention is bestowed on each stage in order to maintain the smoothness of grain, and to obtain a thoroughly clean elastic pelt, than is absolutely needful for any other variety of leather. The tawing mixture consists for each 100 lb of skins of about 25 lb of flour, 34 lb of alum, nearly 1 lb of common salt, and 250 eggs. These substances are made into the consistency of a cream with water, and placed either in a vat or in a revolving drum. In the former case, the skins are trodden with the feet, while in the latter they are tumbled about. The tawed skins, being over-poled, grain side upwards, and dried rapidly; when hardy they are heated in a damp place to soften a little, then damped by passing them through water, next trodden out by foot on a ridged or barred floor, stacked or stretched over a blunt knife, partly dried, and again stacked and dried thoroughly. For dyeing, the skins are first washed out in warm water to free them from superfluous lime, then given a "fel" with yolk of eggs and salt. For bright colours such as soft greys, lavenders, and yellows, the skins are plunged into small dye vats of the proper dye colours, but for all the darker colours the skins are stretched out on a table and the dye stuffs applied with brushes. In the latter case the skins are given a greenish or some alkaline solution, then dyed mostly with logwood, Brazil wood, fustic, Prussian berries, or preparations of indigo, aniline colours being now little used for glove dyeing. The dye is mounted by a wash of the sulphate of either zinc, copper, or iron, which operation also clears and develops the colour. After dyeing it only remains to free the leather from superfluous moisture, dry it, and then with slight damping stake or stretch it out once or twice, which finishes the preparation of this valuable class of leather.

The "feeding" of kid leathers with yolk and sometimes oil produces partial shaming, softening the texture and giving the leather that peculiar suppleness to which much of its value is due. The flour added, by means of the gluten it contains, is supposed to facilitate the absorption of the alumina and thus hasten the tawing.

Hungarian Leather consists of hides and heavy skins partly tawed and partly shamed. In the preparation of this leather it was formerly the practice to shave off the hair with a sharp knife, but now the hides are unshaved either by sweating or liming. After tawing with alum and salt the leather is stuffed by first heating it over a charcoal fire and impregnating the hot leather with tallow, or, as is now common, by working it in a drum with a hot mixture of cod oil and tallow. This leather, being comparatively cheap, is much used on the Continent for common saddle purposes, for which it is blackened, and it is also serviceable for machinery belts.

A leather has been patented by Professor Knapp, in which the active tanning or tawing principle is a basic salt of the oxide of iron. It was intended principally for sole leather, but it does not appear to have met with practical success, and its manufacture is understood to have been abandoned.

Heinsberg's Chroma-Tanned Leather.—Quite recently a large amount of attention has been devoted to a system of tanning or tawing by means of chromum compounds patented by Dr Heinsberg, a German chemist. The oxidizing power of chromate salts, and their powerful effect when combined with organic matter, has long been recognized, and the knowledge of this action and counter-action has led to many unsuccessful attempts, in the past, to use chromates in tanning. It is claimed, however, that the difficulties have been overcome by Dr Heinsberg's process, which consists practically in the use of bichromate of potash, chloride of

potassium or chloride of sodium, and sulphate of alumina. These are mixed together in one large stock tank, from which is drawn by means of a system of piping communicating with each pit the quantity required to make the necessary strength of liquor, thus at first, as in tanning by bark, is very weak, but is strengthened systematically every few days according to the thickness of the hides being tanned. The quantity of chrome and used ordinarily amounts to from about 2½ to 5 per cent. of the weight of leather produced. The price of bichrome at present is 8½d per lb, so that 100 lb weight of leather would cost for this agent from 1s. to 3s.

Light skins such as sheep skins and calf skins are tanned in less than a week, ox and buffalo hides in about a fortnight, and values above 5 inches thick, in six weeks. After being tanned, the hides, which are at this stage of a yellowish tint like sumach-tanned leather, are dipped in chloride of barium, which converts the soluble chromates on the surface into the insoluble chromate of barium. If any particular shade of colour is desired it is then put on, and in general hides are coloured like ordinary leather. After being coloured the leather is allowed to get nearly dry, when it is immersed in pure paraffin wax and resin dissolved together in certain proportions. These materials, with chloride of potassium or chloride of sodium and sulphate of alumina, go to give the necessary smoothness, weight, and waterproofing to the leather. The hides are afterwards dried and brushed clean by brushing machinery. Thus finished, the leather differs very little in appearance from ordinary leather.

Dr Henselwager claims as the meritorious and original feature of his process the complete use of chromate compounds and fatty matters. The stuffing with fat or paraffin of chrome leather, he maintains, in the first place, reduces chromic acid to chrome oxide, and secondly the oxygen thus liberated in the substance of the hide oxidizes the fatty oil and bodies, which, uniting with the chrome oxide, form a third insoluble compound mediant in the fibre of the leather, rendering it at once supple and waterproof.

The leather has been reported on by Mr David Kirkcaldy, London, as considerably stronger than the best bark-tanned leather he was able to procure. After stepping samples of it in cold water six days it has been found that the total quantity of tannin material extracted amounted to from 0·14 to 1·85 per cent., while first-class bark-tanned leather similarly treated yielded 6·79 per cent. By boiling chrome leather in water for half an hour, the loss ranged from 0·05 to 0·64 per cent.

The process seems to offer the means of utilizing classes of hides, such as sheep skins, and values above 5 inches thick, and the values of hippopotamus, &c., in a way which has not hitherto been found practicable by other processes. Sheep skins in chrome-tanning do not require to be pured and freed from their oleaginous constituents, and when finished by this process are no longer porous, but become waterproof, and may be shaved and whitened like calf skins, and may be used for shoe purposes.

The Henselwager process is at work in various localities throughout Germany. For the United Kingdom and British colonies the patent rights have been acquired by the Reignton Chemical Company of Glasgow, who, as manufacturers of bichromate of potash, have an indirect interest in the development of the system. Although the method has yet scarcely passed the critical stage of practical experiment, the products appear to be gaining the favour of men of experience, and, should the system meet the expectation of its originator and promoters, it cannot in the end fail greatly to cheapen many useful classes of leather.

Shamooy or Oil Leather.

The process of preparing leather by impregnating hides and skins with oil is probably the oldest system of leather manufacture. It is that which in earlier times was most largely followed, and among rude and semi-civilized people it is still commonly practised. Notwithstanding this, well-shamooyed leather requires the exercise of much care and numerous manipulative processes. Hides and skins of all classes are prepared by shamooying; but sheep, goat, deer, antelope, and small animal skins in those usually treated, an enormous number of fish splits of sheep being shamooyed for common purposes. The extensive employment of deer skins in shamooying gives the product the name of buck or doe leather, and from the use of the chumens skin of the Alp is derived the name of the process chumens or shamooy, while from the fact that it may be easily washed like cloth it is called wash leather. In former times a large number of ox hides were shamooyed, but now that is little practised.

Skins for shamooying are in the preliminary stages treated almost as for ordinary tanning; but, beyond unhairing, the surface of the grain is shaved off in all except the small thin skins. They are afterwards treated with fish line solution, and repeatedly washed to bring the pelt to somewhat open and porous condition, drenched with brine to remove all lime, and rinsed in an acid liquor. The skins are next stacked out and taken to the filling machine or stocks, where, after being rubbed over individually with fish oil, they are hammered for about two hours to force the oil into the substance of the skin. They are then stretched, hung up for some time, again

oiled, and filled, and these operations may be repeated from six to twelve times according to the thickness of the skins treated. After thorough impregnation the skins are dried, then heaped up in a heated room, where a process of oxidation is quickly set up. So soon as the skins assume a yellow colour and give off a peculiar odour, not at all like fish oil, the process is complete and the fermentation is stopped. It is now found that about one-half of the oil is oxidized within the skin and combined with the tissue to form leather, while the remainder is present only in the condition of mechanical impregnation. This uncombined oil is washed out with a weak potash solution, and the fat so recovered, known as *degras*, forms a valuable material for the dressing of common leather by curriers.

Parchment, Vellum, and Shagreen.

These substances, properly speaking, do not come under the heading of leather at all, seeing they are neither tanned nor tawed, but simply are dressed skins dried and prepared for their peculiar uses. Parchment is made from calf, goat, sheep, and swine skins by the unhairing and dressing processes through which all skins pass preparatory to tanning. When they are thoroughly skinned and fleshed, the skins are stretched tightly in every direction over a frame, and in that condition shaved and equalized on both sides with the currier's knife. After drying, the skins are ready for use as drum leather and for the other ordinary applications of parchment. The common kinds of vellum are made from sheepskin splits, of which two may be obtained from a single skin. To prepare these for use, the splits are, after stretching and drying, repeatedly rubbed over with powdered chalk and powdered stone to raise the fine even velvety surface peculiar to vellum. Common shagreen consists of the skins of various species of sharks and rays prepared in a similar manner to parchment, and Persian shagreen is a kind of tawed parchment with an artificial grain embossed in it, by passing into the substance while in a damp condition the small round seeds of a species of *Ctenopodium*. Shagreen is frequently dyed in bright colours, and used for ornamenting the surfaces of small articles, and the handles of daggers, swords, &c.

Commerce and Statistics.

It is quite impossible to form any adequate estimate of the extent and value of such a trade as that in leather. The raw materials are obtained, in almost equal abundance, throughout the civilized world, and the manufacturing operations are, to a greater or less degree, carried on in every country. The raw materials are largely supplied by local producers, and much of this trade is never recorded in any statistical returns. There can be no doubt that leather takes rank among the foremost half dozen of human industries. Both in Europe and America there is a large number of small and new manufactures and manufactured products, while from the East Indies and the British colonies the largest supplies of various untanned and tanned hides and skins are now exported. Taking cattle hides alone, the import trade of the great manufacturing centres has been stated for 1879—

United Kingdom	... 1,129,458	Hamburg	... 940,880
Marseilles	... 652,597	Boston and New York (U.S.)	3,165,000
Havre	... 825,741		
Antwerp	... 808,413	Total for Europe and America	7,420,881

These came principally from the River Plate, Rio Grande, and Brazil, and are exclusive of 250,000 horse hides imported into Europe, and the whole of the enormous exports of the East Indies. The total number of hides, raw and tanned, exported from India in the year 1877-78 was 9,300,955, and the average for the four preceding years exceeded 7,250,000. A great proportion of these are tanned skins, shipped from Madras almost exclusively to the United Kingdom,—buffalo and the heavier flint dry hides going more largely to the United States. The imports of East Indian skins into the United Kingdom during 1880 amounted to 1,735,978, and in 1881 the number fell to 4,680,803. Of tanned goat and sheep skins, again, the annual export from Madras alone reaches nearly 10,000,000 skins, the numbers for 1880 having been 9,799,900 skins. The total number of sheep and goat skins, raw and rough tanned, imported into the United States in 1880 was 11,781,855, of which 6,533,855 were raw soft stock, 8,859,750 were raw hard East Indian skins, principally from Bengal, and 9,055,500 were tanned East Indian skins.

The following table shows the sources and number of hides imported into the United Kingdom during 1880—

River Plate, salted hides	... 819,743	West Indies	... 10,884
" "	... 81,087	" "	... 12,000
Rio Grande, salted	... 173,287	Cape tops and grubs	... 12,087
Cape	... 80,283	North America	... 10,988
" "	... 290,173	East India Islands	6,707,149
Australia	... 126,140	Horse hides	... 95,200
Brazil	... 96,249		

The following are the Board of Trade returns of articles connected with tanning imported into the United Kingdom, and exported, during the five years ending 1880—

The principal leather markets of the United Kingdom are London, where there are quarterly fairs, Leeds, with eight fairs yearly, and Bristol, which has two leather fairs per year. In the United States the commerce centres principally in New York, Boston, and Philadelphia. On the European continent Paris, Marseilles, Vienna, and Berlin are the most important centres of the leather trade, with Antwerp and Havre as great markets for the sale of hides and skins. (J. P. A.)

LEATHER, ARTIFICIAL. Under the name of artificial leather, or of American leather cloth, large quantities of a material having, more or less, a leather-like surface are used, principally for upholstery purposes, such as the covering of chairs, lining the tops of writing desks and tables, &c. There is considerable diversity in the preparation of the material, but most commonly it consists of a web of calico first prepared with a thick paste to fill up the interstices, and thereafter coated with a mixture of boiled linseed oil mixed with dryers and lamp-black or other pigment, uniformly spread, smoothed, and compressed on the cotton surface by passing it between metal rollers. When the surface is to possess a glossy enamel-like appearance, it receives a finishing coat of copal varnish. A grained morocco surface is given to the material by passing it between suitably embossed rollers. Another material now largely used for preparing artificial leather consists of gelatin mixed with appropriate colouring material, and such chemical agents as, by their reaction on that body, render it insoluble,—calico being coated with the mixture in the manner indicated above. Such insoluble compounds are obtained by the action of acetate of alumina on gelatin, with exposure to a temperature of about 160° Fahr., or by the addition of about one per cent. of bichromate of potash to gelatin solution and exposure to light. The addition of a proportion of glycerin to the gelatinous mass renders the resulting "leather" softer and more plastic than it would otherwise be. These preparations have a close affinity to cloth water-proofed with India-rubber, and to such manufactures as ordinary waxcloth. An artificial leather has been patented and proposed for use as soles for boots, &c., composed of powdered scraps and cuttings of leather mixed with solution of gutta-percha dried and compressed. In place of the gutta-percha solution, oxidized linseed oil or dissolved resin may be used as the binding medium for the leather powder.

LEAVENWORTH, the largest city in the State of Kansas, and chief town of Leavenworth county, is situated in an amphitheatre formed by the bluffs of the right bank of the Missouri, in the midst of a rich agricultural country. The distance from St Louis by river is 496 miles, and by rail 309 miles. In 1853 the site of the city was covered with thick hazel brush, without a trace of human habitation. The following year saw the laying out of the first streets, and by 1864 the value of the taxable property, real and personal, amounted to \$4,103,562. Among the principal buildings are a large Roman Catholic cathedral, a State penitentiary, and a State normal school. Its position on the river, and an extensive railway system, have given Leavenworth a flourishing trade. It possesses two practically inexhaustible mines of bituminous coal,

and has more large manufacturing establishments than any other town on the Missouri, including grist mills, foundries, and manufactories of waggon, carriages, furniture, and shoes. About 2 miles above the city is Fort Leavenworth, the military headquarters of the department of the Missouri. The Government reservation has a river frontage of 6 miles, with a depth of 1 mile. The population was 7429 in 1860, 17,873 in 1870, 16,546 in 1880. At this last date the reservation contained 1115 individuals.

LEBANON. The name of Mount Lebanon (Heb. *לְבָנוֹן*), from the Semitic root *laban*, "to be white, or whitish," probably refers, not to the perpetual snow, but to the bare white walls of chalk or limestone which form the characteristic features of the whole range. Syria is traversed by a branch thrown off almost at right angles from Mount Taurus in Asia Minor, and Lebanon is the name of the central mountain mass of Syria, extending for about 100 miles from north-north-east to south-south-west. It is bounded W by the sea, N. by the plain *Jûn Akkâr*, beyond which rise the mountains of the Nussirieh, and E. by the inland plateau of Syria, mainly steppe-land. To the south Lebanon ends about the point where the river Litâny bends westward, and at Bannâs. A valley narrowing towards its southern end, and now called El-Bukâ's, divides the mountainous mass into two great parts. That lying to the west is still called *Jebel Libân*; the greater part of the eastern mass now bears the name of the Eastern Mountain (*Jebel el-Sharkî*). In Greek the western range was called *Libanus*, the eastern *Antilibanus*.¹ The southern extension of the latter, Mount *HERMON* (*q. u.*), may in many respects be treated as a separate mountain.

Lebanon and Antilibanus have many features in common, in both the southern portion is less arid and barren than the northern, the western valleys better wooded and more fertile than the eastern. In general the main elevations of the two ranges form pairs lying opposite one another; the forms of both ranges are monotonous, but the colouring splendid, especially when viewed from a distance, when seen close at hand, indeed, only a few valleys with perennial streams offer pictures of landscape beauty, their rich green contrasting pleasantly with the bare brown and yellow mountain sides.

Geology.—The Lebanon strata are generally inclined, curved, and twisted, often vertical, seldom quite horizontal. Throughout the whole of Syria the prevailing line of cleavage runs from north to south; subordinate to this is another at right angles to it. The rocks belong to the Middle Chalk system, and fall into four subdivisions. The first consists of an under hippurite zone about 3000 feet thick. Sometimes light grey dolomites boldly rise to a height of several hundred yards (as in *Kasrawân*); sometimes masses of marble present equally grand mountain forms (*Jezzin*); sometimes again friable marl and clay occur, producing rich pasture lands. The last member of this lower zone is a brown colite containing sponges, corals, and echinoderms, amongst which the best known fossil is *Otaris gladius* (Salina). Here also belong the *Radiolaria* of Hakei, above which occurs the famous bed of fossil fishes. The second subdivision of the Middle Chalk consists of a thick sandstone formation, distinguished by the presence of *Trigonia scabra* and *syriaca*, and by a fossil balsam poplar (*Nicotia*). To the period of the formation of this member of the system belong volcanic eruptions of melaphyre and basaltine, and also copious eruptions of ashes, which are now met with as tufa in the neighbourhood of the igneous rocks. These eruptive rocks, which every-

where have again been overlaid by the thick sandstone, yield bitumen (mineral oils, asphalt, and dysochi), and have also had a great influence upon the superficial aspect of the country, the sandstone stratum (1300 to 1600 feet thick) having become the centre of its life and fertility, unusual as here alone water can gather. In the third subdivision, the Turon strictly so-called, oyster beds (*Ostrea africana*) and a stratum of orbiculites have the widest diffusion. Above the oysters come the ammonites (*Ammonites syriacus*, Von Buch). The fourth subdivision is formed by a light grey chalk of the upper hippurite zone, which begins in the Bukâ's, and can be traced as far as to the Red Sea. The latest member is the Eocene nummulite (especially in Antilibanus). Generally speaking the prevailing colours are white in the first district, brown in the second, yellow in the third, and grey in the fourth. Apart from the formations already named, there only remain to be mentioned one or two more recent Tertiaries, which in some cases may go back to the end of the Miocene period, but for the most part are Pliocene. They are met with partly on the coast, being due to the action of the sea (Tripoli), partly in the Bukâ's (Zahleh), the result of the action of fresh water. Finally, throughout the whole of the Lebanon district, there are unmistakable traces of ice action in the shape of ground moraines and erratic blocks. The glacier remains may practically be said to be associated with the four chief streams (Nahr Kadisha, Jôr, Ibrâhim, and Kelb).

Vegetation.—The western variant has the common characteristics of the flora of the Mediterranean coast, but the eastern portion belongs to the poorer region of the steppes, and the Mediterranean species are met with only sporadically along the water-courses. Forest and pasture land in our sense of the word do not exist: the place of the first is for the most part taken by a low brushwood; grass is not plentiful, and the higher ridges maintain a growth of alpine plants only so long as patches of snow continue to lie. The rock walls harbour some rock plants, but many absolutely barren wildernesses of stone occur. (1) On the western variant, as we ascend, we have first, to a height of 1600 feet, the coast region, similar to that of Syria in general and of the south of Asia Minor. Characteristic trees are the locust tree and the stone pine; in *Melba Asdarach* and *Ficus Sycomorus* (Bayrou) we have an admixture of foreign and partially subtropical elements. The great mass of the vegetation, however, is of the low-growing type (*maquis* or *garrigue* of the western Mediterranean), with small and stiff leaves, and frequently thorny and aromatic, as for example the ilex (*Quercus coccifera*), *Smilax*, *Cistus*, *Lentiscus*, *Calycotome*, &c. (2) Next comes, from 1600 to 6500 feet, the mountain region, which may also be called the forest region, still exhibiting as it does sparse woods and isolated trees wherever shelter, moisture, and the bad husbandry of the inhabitants have permitted their growth. From 1600 to 3200 feet is a zone of dwarf hard-leaved oaks, amongst which occur the Oriental forms *Fontanella phyllagroides*, *Acer syriacus*, and the beautiful red-stemmed *Arbutus Andracina*. Higher up, between 3700 feet and 4200 feet, a tall pine, *Pinus Bruta*, Ten., is characteristic. Between 4200 and 6200 feet is the region of the two most interesting forest trees of Lebanon, the cypress and the cedar. The former still grows thickly, especially in the valley of the Kadisha; the horizontal is the prevailing variety. In the upper Kadisha valley there is a cedar grove of about three hundred trees, amongst which five are of gigantic size; it is alleged that other specimens occur elsewhere in Lebanon. The *Cedrus Libani* is intermediate between the *Cedrus Deodara* and the *C. atlantica* (see CHÉDAR). The cypress and cedar zone exhibits a variety of other leaf-bearing and coniferous

¹ Lat., *Antilibanus*. The popular form Antilebanon is not legitimate.

trees; of the first may be mentioned several oaks—*Quercus Meliut*, *Q. subulpinia* (Kotschy), *Q. Cerria*, and the hop-hornbeam (*Ostrya*); of the second class the rare Cilician silver birch (*Abies cilicia*) may be noticed. Next come the junipers, sometimes attaining the size of trees (*Juniperus excelsa*, *J. repens*), and, with fruit as large as plums, *J. drupacea*). But the chief ornament of Lebanon is the *Rhododendron ponticum*, with its brilliant purple flower clusters; a peculiar evergreen, *Vincetoxicum*, also adds beauty to this zone. (3) Into the alpine region (6200 to 10,400 feet) penetrate a few very stunted oaks (*Quercus subulpinia*, Kotschy), the junipers already mentioned, and a barberry (*Berberis cretica*), which sometimes spreads into close thickets. Then follow the low, dense, prone, pillow-like dwarf bushes, thorny and grey, common to the Oriental high lands—*Astragalus* and the peculiar *Acantholimon*. They are found up to within 300 feet of the highest summits. Upon the exposed mountain slopes thubarb (*Rheum Ribes*) is noticeable, and also a vetch (*Vicia cuneata*, Lab.) excellent for sheep. The spring vegetation, which lasts until July, appears to be rich, especially as regards corolla-bearing plants, such as *Corydalis*, *Gagea*, *Bulbularia*, *Colchicum*, *Puschkinia*, *Geranium*, *Ornithogalum*, &c. The flora of the highest ridges, along the edges of the snow patches, exhibits no forms related to our northern alpine flora, but suggestions of it are found in a *Draba*, an *Androsace*, an *Alysse*, and a violet, occurring, however, only in local species. Upon the highest summits are found *Saxifraga Puntica* (resembling our *Silene acaulis*) and varieties of *Galium*, *Euphorbia*, *Astragalus*, *Veronica*, *Jurinea*, *Festuca*, *Scrophularia*, *Geranium*, *Asphodelus*, *Allium*, *Asperula*, and, on the margins of the snow fields, a *Taraxacum* and *Ranunculus* *Scutellaria*. The alpine flora of Lebanon thus connects itself directly with the Oriental flora of lower altitudes, and is unrelated to the glacial flora of Europe and northern Asia.

Zoology.—There is nothing of special interest about the fauna of Lebanon. Bears are no longer numerous, the panther and the ounce are met with; the wild hog, hyena, wolf, and fox are by no means rare; jackals and gazelles are very common. The polecat and hedgehog also occur. As a rule there are not many birds, but the eagle and the vulture may occasionally be seen; of eatable kinds partridges and wild pigeons are the most abundant. In some places the bat occasionally multiplies so as actually to become a plague.

Geography.—The district to the west of Lebanon, averaging about six hours in breadth, slopes in an intricate series of plateaus and terraces to the Mediterranean. The coast is for the most part abrupt and rocky, often leaving room for only a narrow path along the shore, and when viewed from the sea it does not lead one to have the least suspicion of the extent of country lying between its cliffs and the lofty summits behind. Most of the mountain spurs run from east to west, but in northern Lebanon the prevailing direction of the valleys is north-westerly, and in the south some ridges also run parallel with the principal chain. The valleys have for the most part been deeply excavated by the rapid mountain streams which traverse them; the apparently inaccessible heights are crowned by numerous villages, castles, or cloisters embosomed among trees. Of the streams which are perennial, the most worthy of note, beginning from the north, are the Nahr Akkâr, N. Arka, N. el-Bârid, N. Kadisha, "the holy river" (the valley of which begins far up in the immediate neighbourhood of the highest summits, and rapidly descends in a series of great bends till the river reaches the sea at Tripoli), Wâdy el-Joz (falling into the sea at Batrin), Wâdy Fidar, Nahr Ibrahim (the ancient Adonis, having its source in a recess of the great mountain amphitheatre where the

famous sanctuary Apheca, the modern Afke, lay), Nahr el-Kalb (the ancient Lycus), Nahr Beirut (the ancient Magora, entering the sea at Beyrout), Nahr Dâmir (ancient Tamyras), Nahr el-Awaly (the ancient Boetrenus, which is in the upper part of its course is joined by the Nahr el-Barik). The 'Awaly and the Nahr el-Zaherâni, the only other streams that fall to be mentioned before we reach the Litâny, flow north-east to south-west, in consequence of the interposition of a ridge subordinate and parallel to the central chain. On the north, where the mountain bears the special name of Jebel Akkâr, the main ridge of Lebanon rises gradually from the plain. A number of valleys run to the north and north-east, among which must be mentioned that of the Nahr el-Kabir, the Eleutherus of the ancients, which takes its rise in the Jebel el-Abyad on the eastern slope of Lebanon, and afterwards, skirting the district, flows westward to the sea. To the south of Jebel el-Abyad, beneath the main ridge, which as a rule falls away suddenly towards the east, occur several small elevated terraces having a southward slope; among these the Wâdi en-Nasr ("vale of eagles"), and the basin of the lake Yammina, with its intermittent spring Neb'a el-Arba'in, deserve special mention. Of the streams which descend into the Bukâ'a, only the Bârdâni need be named; it rises in Jebel Sunnin, and enters the plain by a deep and picturesque mountain cleft at Zahleh. With regard to height, the most elevated summits occur in the north, but even these are of very gentle gradient, and are ascended quite easily. The names and the elevations of the several peaks, which even in summer are covered with snow, have been very variously given by different explorers; according to the most accurate accounts the "Cedar block" consists of a double line of four and three summits respectively, ranged from north to south, with a deviation of about 35°. Those to the east are 'Uyân Urghush, Makmal, Muskiyya (or Naba' esh-Shemâil), and Ras Zahr el-Kasb; fronting the sea are Karn Saûd or Tumârûn, Fumm el-Misâb, and Zahr el-Kandil. The height of Zahr el-Kasb, by barometric measurement, is 10,018 feet; that of the others is almost the same. South from them is the pass (8351 feet) which leads from Baalbec to Tripoli; the great mountain amphitheatre on the west side of its summit is remarkable. Further to the south is a second group of lofty summits—the snow-capped Sunnûn, visible from Beyrout; its height is 8554 feet, or, according to other accounts, 8895 feet. Between this group and the more southerly Jebel Kuneish (about 6700 feet) lies the pass (4700 feet) now traversed by the French post road between Beyrout and Damascus. Among the other bare summits still further south are the long ridge of Jebel el-Barik (about 7000 feet), the Jebel Nîha, with the Tan'amât Nîha (about 6100 feet), near which is a pass to Sidon, and the Jebel Rihân (about 5400 feet). The Bukâ'a, the broad valley which separates Lebanon from Antilibanus, is watered by two rivers having their watershed near Baalbec, at an elevation of about 8800 feet, and separated only by a short mole at their sources. That flowing northwards, El-'Asy, is the ancient Orontes; the other is the Litâny. In the lower part of its course the latter has scooped out for itself a deep and narrow rocky bed, at Burghuz it is spanned by a great natural bridge. Not far from the point where it suddenly trends to the west lie, immediately above the romantic valley, at an elevation of 1500 feet, the imposing ruins of the old castle Kafât esh-Shakîf, near one of the passes to Sidon. In its lower part the Litâny bears the name of Nahr el-Kasimiyeh. Neither the Orontes nor the Litâny has any important affluent.

The Bukâ'a used to be known as Caesayria (Strabo, xvi. 2, 21), but that word as employed by the ancients had a

much more extensive application. At present its full name is Bukā'a el-'Aziz (the dear Bukā'a), and its northern portion is known as Sahlet Ba'albek (the plain of Baalbek). The valley is from 4 to 6 miles broad, with an undulating surface. It is said to contain one hundred and thirty-seven hamlets or settlements, the larger of which skirt the hills, while the smaller, consisting of mud hovels, stand upon dwarf mounds, the debris of ages. The whole valley could be much more richly cultivated than it is at present; but fever is frequent.

The Antilibanus chain has in many respects been much less fully explored than that of Lebanon. Apart from its southern offshoots it is 67 miles long, while its width varies from 16 to 13½ miles. It rises from the plain of Hasya-Homs, and in its northern portion is very arid and barren. The range has not so many offshoots as occur on the west side of Lebanon; under its precipitous slopes stretch table-lands and broad plateaus, which, especially on the east side looking towards the steppe, steadily increase in width. Along the western side of northern Antilibanus stretches the Khassā'a, a rough red region lined with juniper trees, a succession of the hardest limestone orests and ridges, bristling with bare rock and crag that shelter tufts of vegetation, and are divided by a succession of grassy ravines. On the eastern side the parallel valley of 'Asal el-Ward deserves special mention; the descent towards the plain eastwards, as seen for example at Ma'kila, is singular,—first a spacious amphitheatre and then two deep very narrow gorges. The perennial streams that take their rise in Antilibanus are not numerous; one of the finest and best watered valleys is that of Helbin, the ancient Chalybon, the Helbon of Ezek. xxvii. 18. The highest points of the range, reckoning from the north, are Halimat el-Kabu (8287 feet), which has a splendid view, the Fatly block, including Tal'at Mīsa (8721 feet) and the adjoining Jebel Nebi Bārth (7900 feet), and a third group near Bīdān, in which the most prominent names are Shakif, Akhyār, and Abul-Hin (8330 feet). Of the valleys descending westward the first to claim mention is the Wady Yaffa; a little further to the south, lying north and south, is the rich upland valley of Zebedāni, where the Banādā has its highest sources. Pursuing an easterly course of several hours, this stream receives the waters of the romantic 'An Fijā (which doubles its volume), and bursts out by a rocky gateway upon the plain of Damascus, in the irrigation of which it is the chief agent. It is the Amāna of 2 Kings v. 12; the portion of Antilibanus traversed by it was also called by the same name (Cant. iv. 8). The French post road after leaving the Bukā'a first enters a little valley running north and south, where a projecting ridge of Antilibanus bears the ruins of the ancient cities Chalcis and Gerbia. It next traverses the gorge of Wady el-Harir, the level upland Sahlet Judeidh, the ravine of Wady

el-Karn, the ridge of 'Akabāt el-Tin, the descent Daurat el-Bīllān, and finally the unpeopled plain of Dimās, from which it enters the valley of Barādā. This route marks the southern boundary of Antilibanus proper, where the Hermon group begins (vol. xi. p. 751). From the point where this continuation of Antilibanus begins to take a more westerly direction, a low ridge shoots out towards the south-west, trending further and further away from the eastern chain and narrowing the Bukā'a, upon the eastern side of this ridge lies the elevated valley or hilly stretch known as Wady el-Teim. In the north, beside 'Ain Fālūj, it is connected by a low watershed with the Bukā'a; from the gorge of the Litāny it is separated by the ridge of Jebel ed-Dahr. At its southern end it contracts and merges into the plain of Bannās, thus enclosing Mount Hermon on its north-west and west sides, eastward from the Hasbāny branch of the Jordan lies the meadow-land Merj 'Iyūn, the ancient Ijōn (1 Kings xv. 20).

Political Divisions and Population.—The inhabitants of Lebanon have at no time played a conspicuous part in history. These are remains of prehistoric occupation, but we do not even know what races dwell there in the historical period of antiquity. Probably they belonged partly to Canaanites, but chiefly to the Aramean group of nationalities; the Bible mentions Hivites (Judg. ii. 8) and Gibeites (Josh. xii. 6). A portion of the western coast land was always, it may be assumed, in the hands of the Phœnicians, and it is possible that once and again their sovereignty may have extended even into the Bukā'a. Lebanon was also included within the ideal boundaries of the land of Israel, and the whole region was well known to the Hebrews, by whose poets its many excellences are often praised. In the Roman period the district of Phœnicie extended into Lebanon, in the 2d century it, along with the inland districts pertaining to it, constituted a subdivision of the province of Syria, having Emesa (Homs) for its capital; from the time of Diocletian there was a Phœnicie ad Libanum, with Emesa as capital, as well as a Phœnicie Maritima of which Tyre was the chief city. Remains of the Roman period occur throughout Lebanon, and more especially in Hermon, in the shape of small temples, in more or less perfect preservation, for the more sacred ruins of Baalbek see that article (vol. ii. p. 176). Although Christianity only obtained a footing in Lebanon, the pagan worship, and even human sacrifice, nevertheless survived for a long time, especially in remote valleys such as Akfa. The present inhabitants are for the most part of Syrian (Aramean) descent, Islam and the Arab language at no time penetrated very deep into the mountain land. At present the eastern range belongs to the vilayet of Damascus (Soria), of which Damascus itself constitutes the first subdivision (mutasarriflik); the subordinate divisions (kaza) of the government are Damascus, Baalbek, Hāsaway, Rasbiya, and Bukā'a Ghari or Western Bukā'a. Included within the vilayet of Soria, but with an independent administration, is the government of Lebanon properly so called, a region some 87 miles long, which in virtue of an ordinance published by the Porte in concert with the protecting powers in 1861 and revised in 1864 is ruled by a governor, who must be a Christian, in direct dependence on Constantinople. The seat of the pasha is at present at Ba'alda, 6 miles south-east from Beyrut, his summer residence being at Bētēdin. The pashalik is subdivided into the hutenances of Jurd, Bātrūn, Kasrawān, Metn, Zehle, Shūf, and Jezzin. A somewhat different account of the districts is given in the statistical statement (1876) of the English consul at Beyrut—

Districts	Chief Places	Mohammedans.	Maronites
Shūf	Baalbek	4,458	14,472
Jazīra	Jazīra	170	9,160
Dal el-Kamar	Dal el-Kamar	9,842	92
Metn	Beisun	110	2,568
Zahle	Zahle	78	1,894
Kasrawān	Qhazir	80	26,560
Bātrūn	Town	78	46,000
Kūra	Beisun	1,016	1,008
Total		5,244	116,786

The statistics accompanying the French map of 1862 give the population of Lebanon proper as some 100,000 in excess of these figures, but there can be no doubt of the inaccuracy of this estimate. The same authority gives the districts (taken in order from north to south) as follow—'Akkr, ed-Dunayir, el-Kūm (Upper and Lower), ez-Zāwīya, Beherra, Bātrūn, Jebel, Manaster, el-Fetūh, Kasrawān, el-Metn, Zehle, ez-Sūlū, el-Gharb, el-Mansaf, Shahr, Jurd, Arkub, Shūf, Metn, Rihā, Kharrūb, Tūfāh, Shakif, Shahr, Baalbek, Merj 'Iyūn. Hule and the towns of Sidon,

Districts	Mohammedans.	Orthodox Greeks.	Catholics.	Maronites.	Other Sects.	Total.
Shūf	4,458	14,472	20,774	4,242	2,740	48,286

Total	5,244	116,786	26,388	27,882	17,800	220,554

Beyrut, and Tripoli are also reckoned in this account as belonging to Lebanon. It also enumerates the following districts—

Districts	Mohammedans.	Orthodox Greeks.	Cath.	Maronites.	Other Sects.	Total.
Hāsaway	890	4,610	170	6,580	...	8,150
Rasbiya	820	4,000	7,000	19,820
Bal'at	4,110	5,000	2,100	2,100	7,800	20,230
Baalbek	6,020	2,000	4,000	...	8,000	15,230

The Maronites, as the preceding statistics show, are the principal element of the Lebanon population, for the *Druzes*, see vol. vi. p. 483. The *Metawile*, who enjoy no good reputation, are *Shi'ite* Mohammedans; their shi'ite reside at *Jeb'a* in South Lebanon. Of late years Protestants, through the agency of the American mission at *Byrrout*, has begun to take some hold of the population, and is daily gaining ground. The Catholic missions also, with *Byrrout* for their centre, are meeting with some success, and the Western schools are indisputably affecting the culture and manners of the country. The present comparative security of life and property are highly favourable to its development. Since the violent outbreak of 1860, the bloody contests between the Maronites and *Druzes* have not been renewed, although the mutual hatred still continues. To what has been already said on this subject (vol. vi. p. 485), it may here be added that the primary object of the Lebanon mountaineers is before everything the maintenance of their national freedom, and that the responsibility for the massacres of 1860 rests chiefly upon the Turkish Government (*Ahmet Pasha* of *Damascus*). The property of the Maronites had been promised to the *Druzes*, and the Maronites on the other hand had been persuaded to disarm; as soon as the latter had done so they were attacked by *Druzes* and *Turks* together. In *Deir el-Kamar* alone, the chief place of South Lebanon, eighteen hundred Maronites perished. Since the pacification of the country by foreign intervention, particularly on the part of *Napoleon III.*, the *Druzes* have withdrawn more into the inaccessible *Hauan*. Although every inhabitant of Lebanon still retains his warrior habits, and willingly enough joins the high-land troops (six hundred regular soldiers), the situation is now much more pacific, a circumstance due in large measure to the fact that the power of the numerous noble families has been much curtailed. On the other hand the clergy, although for the most part an extremely uneducated body of men, has great influence among the Maronites. The number of Maronite monks in the mountain district is said to reach eight thousand. The monasteries possess a large portion of the best land, which is cultivated by the monks themselves, and is quite exempt from all public burdens. Other land is liable to be taxed annually at the rate of 3s 6d. upon every £55 of assessed value; there is, besides, a poll tax exigible from every healthy male from the age of fourteen until he becomes unfit for work. The village head (*sheikh*), for every £8 of taxes, is entitled to exact from the inhabitants 4s. for his own remuneration. Every inhabitant must devote to the public service four days of free labour in the year. The gross revenue of Lebanon, which amounts to about £32,000 per annum, does not cover the expenses of administration.

The Lebanon mountaineers are a fine vigorous set of men. In what relates to dress they show a preference for gay colours. Tattooing is universal in both sexes. Their diligence is worthy of all praise. In the upper regions cattle breeding is the chief occupation, the numerous flocks of sheep and goats are the great obstacle to forestry in these parts. No care is taken to protect the woods. For practical utility the trees which are planted (besides various fruit trees, especially figs) are the white poplar (for building purposes), the walnut, the olive, and above all the mulberry,—silk culture being an important industry with the mountain population, and still remunerative notwithstanding the occasional fall of prices. In 1872 the production amounted to 2,000,000 oaks (about 5,000,000 lb) of fresh cocoons, from which 1,200,000 oaks of raw silk and 200,000 oaks of silk fabrics were produced, the latter exclusively for home use. The vine is cultivated,

and with great care, at an elevation of 3900 to 5200 feet. Unfortunately the wine is simply stored in large stone jars, there being neither barrels nor cellars; the consequence is that it cannot be kept—in point of fact it is seldom more than a year old—and exportation is impossible. The excellent Lebanon white wine known as *vino d'oro* belongs to the class of sweet wines. Amongst the mineral products coal deserves special mention, the beds are thick, but the presence of iron pyrites prevents it from coming into more general use. Some shafts, from which bitumen is obtained, occur in the neighbourhood of *Hasbaya*, also petroleum wells. The chief food crops are wheat, *Holcus scirpoides*, and barley, the last being cultivated as high as 6500 feet above the sea. Tobacco culture is universal.

Throughout the whole of Lebanon, but especially on the slope towards the sea, carefully tended terraces occur. The houses, little four-cornered boxes, generally shaded by a walnut or fig tree, stand as a rule upon the slope; the roof is formed by pine stems upon which other timber, brushwood, and finally a coating of mud clay are laid. Under good government Lebanon, with its able and vigorous population, would rapidly develop.

LEBANON, a manufacturing "borough" of the United States, capital of Lebanon county, Pennsylvania, is situated on the Union Canal, 24 miles east of Harrisburg by the Lebanon Valley branch of the Philadelphia and Reading Railway. It is substantially built in brick and stone, and is steadily increasing in importance. Its principal industrial establishments are blast furnaces, rolling mills, car-works, planing mills, foundries, and manufactories of organs, paper, cigars, carriages, and agricultural implements. About 7 miles distant are the Cornwall Ore Banks, three eminences—Grassy, Middle, and Big Hill—consisting almost entirely of iron-ore veined with copper. The town was laid out in 1750, and incorporated as a borough in 1813; gas was introduced in 1857, and in 1872 water was brought into the place by gravitation at an expense of \$250,000. The population of Lebanon has increased from 2184 in 1850 to 6727 in 1870, and 8778 in 1880.

LEBDA. See LEPTIS.
LE BEAU, CHARLES (1701–1778), a French historical writer, was born at Paris on October 15, 1701, and was educated at the Collège de Sainte-Barbe and the Collège du Plessis; at the latter he remained as a teacher after the termination of his course as a pupil, until he obtained the chair of rhetoric in the Collège des Grassins. In 1748 he was admitted a member of the Academy of Inscriptions, and in 1752 he was nominated professor of eloquence in the Collège de France. From 1755 he held the office of perpetual secretary to the Academy of Inscriptions, in which capacity he edited fifteen volumes (from the 25th to the 39th inclusive) of the *Histoire* of that institution. He died at Paris on March 13, 1778.

The only work with which the name of Le Beau continues to be associated is his *Histoire du Bas-Empire, en commençant à Constantin le Grand*, in 23 vols 12mo (Paris, 1756-1778), being a continuation of Rollin's *Histoire Romaine* and Crevier's *Histoire des Empereurs*. Its usefulness arises entirely from the fact of its being a faithful record of the Byzantine historians, for Le Beau had no originality or artistic power of his own. Five volumes were added by Amelion (1781-1811), which brought the work down to the fall of Constantinople. A later edition, under the care of Saint-Martin and afterwards of Brunet, has had the benefit of careful revision throughout, and has received considerable additions from Oriental sources.

LEBEDIN, a district town of the Kharkoff government in European Russia, 102 miles north-west of the government town, near the Okhanka and Buravka, two small tributaries of the Dnieper. Its population has increased from 13,137 in 1863 to 17,019 in 1879. There are four annual fairs, and a good trade in grain and cattle.

Lebedin dates from the middle of the 17th century. In 1700 it was the headquarters of the operations of Peter the Great against Mazepa, and the scene of the execution of nine hundred of that hetman's followers, whose common grave is still marked by a mound 70 feet square.

LEBEDYAN, a district town of the Tamboff government in European Russia, situated 132 miles west of Tamboff, on the bluffs of the right bank of the Don. It possesses a modern cathedral (Kazanaki) and several churches of architectural and antiquarian interest; and in the immediate vicinity is the great Eletski Troitski monastery, which under the name Yablonoivi Pustuin was founded in 1621. The prosperity of the town is closely bound up with that of its three annual fairs, of which the first two continue for a month and the last for six days,—many of the inhabitants deriving the better part of their income from the rents paid by their merchant visitors. The chief fair is held near the monastery, and is known as the Troitskaya. The population, returned in 1863 as 5849 (exclusive of the suburbs, with 3046), was 6010 in 1879.

Lebedyan probably dates from the 16th century. It was reckoned a town in the beginning of the 17th, and about 1678 it became the centre of a district.

LEBRJA, or **LEBRJA**, a town of Spain, in the province of Seville, near the left bank of the eastern arm of the Guadalquivir, and on the eastern edge of the flat fluvial tract known as "Las Marismas," formed by that river. It is 44 miles by rail from Seville, which lies north by east, and about 60 miles from Cadiz. The climate is somewhat unfavourably affected by the proximity of the marshes, but the sierra beneath which it lies protects the town from the hot eastern winds, and it enjoys during the heats of summer the pleasant alternation of land and sea breezes. The parish church, the only building of any note, is a somewhat imposing structure in a variety of styles—Moorish, Gothic, Romanesque—dating from the 14th to the 16th century; it contains some early specimens of the carving of Alonso Cano. The manufactures, which are unimportant, consist chiefly of bricks, tiles, and earthenware, for which a useful clay is found in the neighbourhood; there is some trade in the grain, wine, and oil of the surrounding district. The population in December 1877 was 12,864.

Lebrja is the Nabrisia or Nobrisa, surnamed Yeneria, of the Romans; by Julius Africanus (c. 200), who associates it with the worship of Dionysus, the name is derived from *oxyph*. Nabrisah was a strong and populous place during the period of Moorish domination; it was taken by St Ferdinand in 1249, but again lost, and became finally subject to the Castilian crown only under Alphonso the Wise in 1264. It was the birthplace of Elío Antonio de Lebrija or Nobrija (1444-1529), better known as Nebrienseño, one of the most important leaders in the revival of learning in Spain, the tutor of Queen Isabella, and a collaborator with Jimenez in the preparation of the Complutensian Polyglott.

LE BRUN, CHARLES (1619-1690), French painter, was born at Paris 24th February 1619, and attracted the notice of Chancellor Séguier, who placed him at the age of eleven

in the studio of Vouet. At fifteen he received commissions from Cardinal Richelieu in the execution of which he displayed an ability which obtained the generous commendations of Poussin himself, in whose company Le Brun started for Rome in 1642. In Rome he remained four years in the receipt of a pension due to the liberality of the chancellor. On his return to Paris Le Brun found numerous patrons, of whom the celebrated Superintendent Fouquet was the most important. Employed at Vaux la Vicomte, Le Brun, who had an immense amount of worldly tact, ingratiated himself with Mazarin, then secretly pitting Colbert against Fouquet. Colbert also promptly recognized Le Brun's powers of organization, and attached him to his interests. Together they founded the Academy of Painting and Sculpture (1648), and the Academy of France at Rome (1666), and gave a new development to the industrial arts. In 1680 they established the Gobelins, which at first was a great school for the manufacture, not of tapestries only, but of every class of furniture required in the royal palaces. Commanding the industrial arts through the Gobelins, of which he was director, and the whole artist world through the Academy—in which he successfully held every post—Le Brun imprinted his own character on all that was produced in France during his lifetime, and gave a direction to the national tendencies which endured even after his death. The nature of his emphatic and pompous talent was in harmony with the taste of the king, who, full of admiration at the decorations designed by Le Brun for his triumphal entry into Paris (1660), commissioned him to execute a series of subjects from the history of Alexander. The first of these, Alexander and the Family of Darius, so delighted Louis XIV. that he at once ennobled Le Brun (December 1662), who was also created first painter to his majesty with a pension of 12,000 livres, the same amount as he had yearly received in the service of the magnificent Fouquet. From this date all that was done in the royal palaces was directed by Le Brun. The works of the gallery of Apollo in the Louvre were interrupted in 1677 when he accompanied the king to Flanders (on his return from Lille he painted several compositions in the Chateau of St Germain), and finally—for they remained unfinished at his death—by the vast labours of Versailles, where he reserved for himself the Halls of War and Peace, the Ambassadors' Staircase, and the Great Gallery, other artists being forced to accept the position of his assistants. At the death of Colbert, Louvois, who succeeded him in the department of public works, showed no favour to Le Brun, and in spite of the king's continued support he felt a bitter change in his position. This contributed to the illness which on 22d February 1690 ended in his death in the Gobelins. Besides his gigantic labours at Versailles and the Louvre, the number of his works for religious corporations and private patrons is incredible. He modelled and engraved with much facility, and, in spite of the heaviness and poverty of drawing and colour, his extraordinary activity and the vigour of his conceptions justify his claim to fame. Nearly all his compositions have been reproduced by celebrated engravers.

LECCE, one of the most important cities of Southern Italy, and the administrative centre of the province of Lecce (formerly Terra d'Otranto), is situated on the railway between Brindisi and Otranto, about 8 miles from the coast of the Adriatic. Down to the middle of the 18th century it was defended by regular fortifications constructed in the 16th century, and it still preserves some of the gateways, as well as a triumphal arch erected in honour of the entry of Charles V. Among his public buildings are the cathedral (dedicated to St Oronzio, traditional first bishop of the city, whose statue, on a lofty column, adorns the principal square), the old convent of the Celestines now

occupied by the prefecture, the old convent of the Capuchins, and the marble church of St Nicholas. Beauvoisin institutions are specially numerous, and include a hospital dating from 1389, and a communal orphanage from 1608. A public library was founded in 1863. The name of Lecco has long been familiar throughout Italy in connexion with the great tobacco factory now located in the Dominican convent, and cotton and woollen goods, lace, artificial flowers, hats, &c., are among the products of the local industry. The population increased from 17,856 in 1801 to 18,400 in 1871.

Lecco is identified with *Lepagus*, a city of the Salustines, and, though remains of ancient edifices are no longer to be seen, there is evidence of the existence of extensive substructions as late as the 15th century. The name *Lycea*, or *Lycia*, begins to appear in the 8th century. The city was for some time held by counts of Norman blood, among whom the most noteworthy is Bohemond, son of Robert Guiscard. It afterwards passed to the Orsini. The rank of provincial capital was bestowed by Ferdinand of Aragon in acknowledgment of the fidelity of Lecco to his cause. Scipione Ammirato (*Florentinus historiam*), Democeno de Angelis, and G. Bighini the anatomist were natives of the city.

LECCO, a city of Italy, in the province of Como, situated near the southern extremity of the eastern branch of the Lake of Como, which is frequently distinguished as the Lake of Lecco. It is the meeting place of several important roads, and the terminus of a railway from Bergamo, which joins the line from Milan. To the south the Adda is crossed by a fine bridge originally constructed in 1335, and rebuilt in 1609 by Fuentes. Lecco, in spite of its real antiquity, presents quite a modern appearance; and it is the seat of no small industrial activity. Besides the iron-works, which are particularly important, there are brass foundries and oil-works; and silk spinning, cotton spinning, and wood carving are successfully prosecuted. The annual cattle fair lasts fifteen days. In the neighbourhood of the town is Caleotto, the residence of Manzoni, who in his *Promessi Sposi* has left a full description of the district. The population of Lecco was 6815 in 1871.

In the 11th century Lecco, which had previously been the seat of a marquessate, was presented to the bishops of Como by Otto II.; but in the 12th century it passed to the archbishops of Milan, and in 1127 it assisted the Milanese in the destruction of Como. During the 18th century it was struggling for its existence with the metropolitan city; and its fate seemed to be sealed when the Visconti drove its inhabitants across the lake to Valmadrera, and forbade them to raise their town from its ashes. But in a few years the people returned; and Azzone Visconti made Lecco a strong fortress, and united it with the Milanese territory by a bridge across the Adda. During the 15th and 16th centuries the rock of Lecco was an object of endless contention. In 1647 the town with its territory was made a comitatus. The fortifications were finally sold by Joseph II. to Count Serbelloni. Marfisi, one of the first Italian printers, and Morona, Charles V.'s Italian chancellor, were born in Lecco. See Apostolo, *Lecco e suo territorio*, Lecco, 1856.

LE CLERC, JEAN (1657-1736), or CLERICUS, theologian and man of letters, was born March 19, 1657 (o.s.), at Geneva, where his father Stephen Le Clerc was professor of Greek. The family had originally belonged to the neighbourhood of Beauvais in France, and several of its members have acquired some name in literature. On the completion of his grammar school course (in which he made himself remarkable for his omnivorous reading), he applied himself to the study of philosophy under Chouet the Cartesian, and from his nineteenth to his twenty-first year he attended the theological lectures of Mestrezat, Turretin, and Louis Tronchin. In 1678-79 he spent some time at Grenoble as tutor in a private family; on his return to Geneva he passed his examinations and received ordination. Soon afterwards he went to Saumur, where in 1679 were published *Liberi de Sancto Amore Epistolæ Theologicæ* (Irenopol: Typis Philalethianis), usually attributed to his pen; they deal with such subjects as the doctrine of the Trinity, the hypostatical union of the two natures in Jesus Christ, original sin, and the like, in a manner sufficiently

far removed from that of the conventional orthodoxy of the period. From Geneva, which he still continued to regard as his home, Le Clerc in 1682 went to London, where he remained six months, preaching on alternate Sundays in the Walloon church and in the Savoy chapel. Passing over to Amsterdam he was introduced to Locke and Limborch; the acquaintance with the latter soon ripened into a close friendship, which naturally strengthened his preference for the Remonstrant theology, already favourably known to him by the writings of his granduncle Curcellæus, and by those of Episcopius. A final attempt to live at Geneva, made at the request of his relatives there, satisfied him of the unwholesomeness of its stifling theological atmosphere, and in 1684 he finally settled at Amsterdam, first as a moderately successful preacher until ecclesiastical jealousy shut him out from that career, and afterwards as professor of philosophy, belles-lettres, and Hebrew in the Remonstrant seminary. This appointment, which he owed to his friend Limborch, he held from 1684 till 1712, when on the death of the latter he was called to occupy the chair of church history also. His suspected Socinianism was the cause, it is said, of his exclusion from the chair of dogmatic theology. Apart from his varied and immense literary labours, his life at Amsterdam was quite uneventful. His marriage to the daughter of Gregorio Leti took place in 1691. In 1728 and following years repeated strokes of paralysis gradually reduced him to a state of mental imbecility, from which he was released by death on January 8, 1735.

A full catalogue of the publications of Le Clerc will be found, along with adequate biographical material, in Heag's *France Protestante* (where seventy-three works are enumerated), or in *Classique des Docteurs*. Only the most important of these can be mentioned here. In 1685 he published *Sentimens de quelques théologiens de Hollande sur l'Histoire Critique du Vieux Testament composé par le P. Richard Simon*, in which, while pointing out what he believed to be the faults of that author, he undertook to make some positive contributions towards a right understanding of the Bible, among these last may be noted his argument against the Mosaic authorship of the Pentateuch, his views as to the manner in which the five books actually were composed, his opinions (singularly free for the time in which he lived) on the subject of inspiration in general, and particularly as to the inspiration of Job, Proverbs, Ecclesiastes, Canticles. Simon's *Réponse* (1688) elicited from Le Clerc a *Défense des Sentimens* in the same year, which was followed by a new *Réponse* (1687). In 1692 appeared his *Logica seu Ars Ratiocinandi*, and also *Ontologia et Pneumatologia*; these, with the *Physica* (1696), are incorporated with the *Opera Philosophica* which have passed through several editions. In 1693 his series of Biblical commentaries began with that on Genesis, it was not completed until 1731. The portion relating to the New Testament books included the paraphrase and notes of Hammond. Le Clerc's commentary had a great influence in breaking up traditional prejudices and opening men's eyes to the necessity for a more scientific inquiry into the origin and meaning of the Biblical books. It was on all sides hotly attacked,—often for opinions which now seem innocent to the most orthodox. Le Clerc's new edition of the *Apostolic Fathers* of Octavianus, published in 1698, marked an advance in the critical study of these documents. But the greatest literary influence of Le Clerc was probably that which he exercised over his contemporaries by means of the *sermo*, or, if one may so call them, reviews, of which he was editor. These were the *Bibliothèque universelle et historique* (Amsterdam, 25 vols. 12mo, 1688-93), begun along with De la Croix; the *Bibliothèque choisie*, Amsterdam, 26 vols. 18mo, 1703-15; and the *Bibliothèque ancienne et moderne*, 20 vols. 18mo, 1714-25. See Le Clerc's *Paraphrasæ on Pœneus sur des notions de critique, d'histoire, de morale, et de politique; avec la défense de divers ouvrages de M. L. C. par Théodore Parrhasius*, Amsterdam, 1699; and *Vita et opera ad annum MDCCXII, cunctisque operum, philosophæ Clericæ operibus subjunctum*, also attributed to himself. The supplement to Hammond's acts was translated into English in 1699, *Parrhasiana, or Thoughts on Several Subjects*, in 1700, and the *Harmony of the Gospels* in 1701. Twelve *Dissertationes* out of M. Le Clerc's *Genesis* appeared in 1699.

LECTION, LECTONARY, LECTOR. The Jewish custom of reading the books of Moses in the synagogues every Sabbath day was already ancient in the apostolic age, and we learn from Luke iv. 16, 17, that portions were also

read from the prophets, though the system of prophetic lessons at least had not yet reached the fixity of the later ritual. For obvious reasons the reading of Scripture at public worship was continued by the Christian Church with certain modifications (1 Thess. v. 27; Col. iv. 16). An authority so early as Justin Martyr (*Apol.*, I. 67) states that in the Christian assemblies of his day "the memoirs of the apostles, or the writings of the prophets, are read as long as time permits." What we are presently to understand by these "memoirs of the apostles" is doubtful; but the evidence we have, fragmentary though it is, may be said to make it certain that neither in his day, nor for many years afterwards, was the canon of sacred books to be read in public worship rigidly fixed, and still less were definite portions of Scripture appointed to be read on particular days of the ecclesiastical year. Traces of the office of reader as distinct from that of deacon begin to appear in Tertullian (*De Præser.*, 41), who makes frequent allusions to the public reading of both Old and New Testament Scriptures (*Apol.*, 39, *De Præser.*, 36; *De An.*, 9), but says nothing that can be construed as implying anything like a fixed table of lessons. Towards the end of the 4th century, however, indications of a widely spread custom of reading the Scriptures according to a uniform and rigid scheme became frequent; and the practice even then was spoken of as ancient. Thus Chrysostom and Augustine both show incidentally that the Acts of the Apostles were publicly read between Easter and Pentecost and then laid aside, while Genesis was read in Lent. In the *Apostolical Constitutions* (ii. 87) a very methodical service is enjoined, it prescribes two lessons from the Old Testament by a reader, the Psalms of David are then to be sung, next the Acts of the Apostles and the epistles of Paul, and finally (by a deacon or presbyter) the gospels, are to be read. The labours of Scholz and Tischendorf have brought to light a large body of MS. Greek lectionaries ranging between the 7th and the 10th century, from which, when fully collated, it will probably be possible to ascertain with precision the order of yearly lectures contemplated within the circles to which the documents respectively belong. Most of them contain gospel lessons only; the rest lessons from the Acts and the epistles. The *Evangelion* and *Apostolos* of the modern Greek Church has a proper gospel and epistle, not only for every Saturday and Sunday, but for every day of the week. The order of (continuous) lessons for the five ordinary week days cannot be traced with certainty further back than to the 10th century, but those for the Sundays, also for the most part continuous, can be traced, so far as the gospels at least are concerned, to the 8th, and large coincidences with the Armenian lectionary lend to the inference that much had been already fixed before 595. Of Western lectionaries the earliest is probably the *Liber Comitis sive Lectorarius*, which used to be attributed to Jerome. On the whole it does not observe a *lectio continua*, but is characterized rather by free selection of suitable passages for each Sunday. Next in chronological order is the *Tubala*, drawn up by Victor of Capua (546); it was printed by Gerbert in his *Memoria. Vel. Liturg. Alem.* in 1777. It also has no trace of *lectio continua*. The same remark applies to the Luxueil lectionary, edited by Mabillon in the *De Liturgia Gallicana* (Migne, *Patr.*, lxxii.), it is assigned by Mabillon to the end of the 7th century, and certainly is not later than the time of Charlemagne; besides the usual gospel and epistle, it prescribes a lesson from the Old Testament.

The earliest allusion seeming to imply an order of lectures or readers as one of the standing orders of the church occurs, as already mentioned, in a solitary passage in Tertullian. In Cyprian, allusions much less ambiguous are frequent. The *Apostolical Constitutions* give a form of prayer to be used

at the ordination of lectors by the imposition of hands. In the modern Greek Church the functions of the Anagnostes are strictly confined to the reading of the epistle, that of the gospel being reserved for the deacon. In the old Catholic Church, the ordination of lectors was by publicly placing the Bible in their hands, with some such formula of exhortation as is prescribed in can. 8 of the fourth council of Carthage. By the council of Trent the order of lector was recognized as one of the minor orders of the Roman Catholic Church, but it has no actual independent existence, being regarded merely as a necessary step in promotion to a higher office.

LEDA. See CLASTOR AND POLLEX.

LEDRU-ROLLIN, ALEXANDRE AUGUSTE (1807-1874), was the grandson of a celebrated quack-doctor of the reign of Louis XV., who took the name of Comins, and made a large fortune in curing or attempting to cure epilepsy by magnetism. He himself was born in the house of Sarrasin at Fontenay-aux-Roses, on February 2, 1807, was educated at Paris, and had just been entered at the Paris bar, when the revolution of July 1830 broke out. He soon made himself a great name as an advocate, and was engaged on the republican side in all the great political trials of the next ten years. He also wrote many political tracts, and edited more than one republican newspaper, so that when he was elected as deputy for Le Mans in 1841 he was expected to take up an advanced republican position in the chamber. From this time to the outbreak of the revolution of February 1848 he was regarded as the chosen leader of the working men of France, and spoke and wrote in favour of liberty of labour and universal suffrage. It was in the speeches of himself and his friends Lamartine and Louis Blanc at Lille, Dijon, and Chalons at working men's banquets during the latter months of 1847 that the revolution of 1848 was most clearly foreshadowed and prepared. When it did actually break out, it was Ledru-Rollin who overthrew the project of making the duchess of Orleans regent, and obtained the nomination of a provisional government. In this provisional government he was clearly pointed out by his influence among the working men for the ministry of the interior. When he resigned on June 24, 1848, he found that his four months of office had lost him his old leadership, as the conscientious performance of such an office inevitably would, but he had the credit of having for the first time established a working system of universal suffrage. He tried to regain his old influence, but in vain, and at the election of president in December had but 370,000 votes. The earlier months of 1849 he spent in protesting against the policy, especially the Roman policy, of the president Louis Napoleon Bonaparte and his ministry, which culminated in his moving their impeachment. His motion being defeated on June 19 by 289 to 8, he on June 13 headed what he called a peaceful demonstration, and his enemies an appeal to arms, which was soon dispersed. Ledru-Rollin himself escaped to London, where he signed the manifestoes of the revolutionary committee of Europe with Kossuth, Mazzini, Ruge, and sometimes Desatz. He also employed his leisure in writing a work on the *Décadence d'Angleterre*, in which he attempted to deduce the necessary fall of England from its aristocratic form of government and the misery of the lower classes. In 1870 he returned to Paris, but though elected in three departments he refused to sit in the national assembly of 1871. In 1874 he consented to sit for the department of Var, and spoke at length on June 3 on an electoral scheme, upholding the one great aim and achievement of his life, universal suffrage. The effort was too much for his health; he steadily grew weaker and weaker, and died on December 31, 1874. Perhaps the best succinct description of his character and political position in the sixteen short months of his real

power is to be found in the speech of Victor Hugo at the unveiling of his bust in Père La Chaise: "Louis Blanc was the apostle of the revolution of February, Lamartine the orator, and Ledru-Rollin the tribune."

The *Discours politiques et oratoires* of Ledru-Rollin were published by his widow in 1879, his *Discours d'Angleterre* was published in 1880, and an account of his political position is to be found in all histories of the revolution of 1848.

LEDYARD, JOHN (1751-1789), traveller, was born in Groton, Connecticut, U.S., in 1751. After vainly attempting to settle down to the study of law and theology, Ledyard adopted the life of a seaman, and, finding his way to London, was engaged in 1776 as a corporal of marines by Captain Cook, for his third voyage of discovery. On his return in 1778 Ledyard had to give up to the Admiralty the copious notes he had kept, but was nevertheless able to publish a somewhat meagre narrative of his experiences (Hartford, U.S., 1783). He continued in the British service till 1782, when, his ship being off Long Island, he managed to escape. Ledyard returned to Europe again in 1784, his purpose being to obtain the means of fitting out an expedition to the north-west coast of America. Having failed in his attempts, he decided to reach his goal by travelling across Europe and Asia. On his arrival in Stockholm (1786) he attempted to cross to Åbo in Finland on the ice; but, meeting with open water, he turned back, walked all the way round the head of the gulf, down through Finland, and on to St Petersburg, where he arrived in March 1787 without shoes or stockings, and penniless. He made friends, however (among others Pallas), and got permission from the Government to accompany Dr Brown, a Scotch physician in the Russian service, to Siberia. Ledyard left Dr Brown at Barnaul, went on to Tomsk and Irkutsk, then visited Lake Balkal, and, reaching the Lena, sailed down to Yakutsk, where he arrived on September 18. With a Captain Billings he returned to Irkutsk, where on February 14, 1788, he was suddenly arrested, hurried across Siberia and Europe to the frontier of Poland, and ordered not to return under pain of death. On reaching London, Ledyard was befriended by Sir Joseph Banks, who engaged him on behalf of the African Association to carry on their work of exploration in Africa. His career was, however, cut short at Cairo, where he died on January 17, 1789. Ledyard was a born explorer, and, had he fallen into good hands in good times, and his energies been properly directed, would probably have done good work. As it was, no results of permanent value came of his wide and aimless wanderings. His life, with extracts from his journals, was written by Jared Sparks for the Library of American Biography (1828), and is also published separately.

LEE, NATHANIEL (c. 1650-1692), dramatist, was the son of Dr Lee, incumbent of Hatfield, Hertfordshire. He studied at Westminster School and Trinity College, Cambridge. After essaying the profession of an actor with very slight success, he wrote several tragedies, the best known of which are *The Royal Queens*, 1677, and *Theodosius*, 1680. He also assisted Dryden in producing *Edipus* and *The Duke of Guise*. From 1684 to 1688 he was an inmate of Bedlam, and afterwards until his death he was subject to intermittent attacks of insanity. Though he wrote the *Princess of Cleve* in 1689, and the *Massacre of Paris* in 1690, he was in his later years dependant chiefly on charity. He died in London in 1692, not in 1690 as is usually stated, the register of St Clements Danes church giving the date of his burial as the 6th May. The dramas of Lee are of course written in the artificial style characteristic of the period, and they also display occasionally a tendency to wild extravagance, but they nevertheless contain many passages of true poetic tenderness and grace.

LEE, RICHARD HENRY (1732-1794), an American statesman and orator, born in Westmoreland county, Virginia, U.S., January 20, 1732, was one of six distinguished sons of Thomas Lee, a descendant of an old Cavalier family. After obtaining the foundation of a liberal education in England, and spending a little time in travel, he returned to Virginia in 1752, coming into possession of a fine property left him by his father, and for several years applied himself to varied studies. At the age of twenty-five he was appointed justice of the peace, and soon after was chosen a delegate to the house of burgesses. He kept a diffident silence during two sessions, his first speech being in strong opposition to slavery, which he proposed to discourage, and eventually to abolish, by imposing a heavy tax on all further importations. In 1764 Lee had applied for a collectorship under the Stamp Act, which afterwards roused the determined hostility of the colonies, but on reflexion he regretted doing so, and became an outspoken promoter of the most extreme democratic ideas. In February 1766 he organized an association in Westmoreland, in accordance with Patrick Henry's famous resolution against the Act. At the winter session of the burgesses in 1766, Lee, with the aid of Patrick Henry, succeeded in carrying the house upon a test question against the united aristocratic elements of the colony. In 1767 he spoke eloquently against the acts levying duties upon tea and other articles, and in 1768, in a letter to John Dickinson of Pennsylvania, he made the suggestion of a private correspondence among the friends of liberty in the different colonies. Lee is said also to have originated, in a conversation with fellow burgesses in 1773, the plan of an inter-colonial or so-called continental congress, which was carried into effect next year. At this first congress in Philadelphia in 1774, Lee is said to have penned the address to the king, and is known to have prepared that to the people of British America, together with the second address to the people of Great Britain, directed by congress in 1775, both of which are among the most effective papers of the time. On June 7, 1776, instructed by the Virginia house of burgesses, he introduced in congress the resolutions declaring "that these united colonies are, and of right ought to be, free and independent states, that they are absolved from all allegiance to the British crown, and that all political connexion between them and the state of Great Britain is, and ought to be, totally dissolved." Lee was in congress in 1778-80 and 1784-85, and was one of the first senators chosen from Virginia after the adoption of the federal constitution. Though strongly opposed to the adoption of that constitution, owing to what he regarded as its dangerous infringements upon the independent power of the States, he accepted the place of senator in hope of bringing about amendments. He became a warm upholder of Washington's administration, and his prejudices against the constitution were largely removed by its working in practice. He retired from public life in 1792, and died at Chantilly in Westmoreland county, June 19, 1794.

See *Memoirs*, by his grandson E. H. Lee, 2 vols., 1825.

LEE, ROBERT EDWARD (1807-1870), general of the Confederate States army, and one of the greatest of modern commanders, was born at Stratford, in Westmoreland county, Virginia, on January 19, 1807. His father, General Harry Lee, better known in the War of Independence as "Light-Horse Harry Lee," and afterwards governor of Virginia, was the son of a cousin of the subject of last article. Robert Lee entered the military academy at West Point in 1825, and graduated in 1829, when he received a commission in the corps of engineers. When the Mexican war broke out Lee, who was then captain, served in the army under General Scott. He distinguished himself greatly throughout the campaign, and was brevetted as

colonel for his conduct at the siege of Chapultepec, where he was wounded. In 1852 he was appointed superintendent of the academy at West Point, and in 1855 he was promoted lieutenant-colonel of the second regiment of cavalry, with which he served in Texas. In March 1861 he was made colonel of the first regiment of cavalry, but in the following month, learning that his native State had withdrawn from the Union, he resigned as an officer of the United States army, and was forthwith put in command of the Virginia forces. When Virginia joined the Confederacy he was the third of five generals appointed by the Southern Congress. No adequate opportunity of gaining distinction was afforded him, however, until the beginning of June 1862, when he received command of the army of northern Virginia, and commenced the series of operations the result of which before the month had closed was to compel McClellan to abandon the siege of Richmond. Following up this advantage and Jackson's victory at Cedar Run on August 3, Lee advanced in person to lead the army that was being formed on the south bank of the Rappahannock, after crossing that river he inflicted upon Pope at Manassas the disastrous defeat by which the Federal army was compelled to retire within the fortified lines of Washington. Lee now decided on the invasion of Maryland, and advanced to Frederick city, but, being compelled to divide his forces, he sustained a check in the passes of South Mountain (September 16, 17) which compelled him to recross the Potomac. After a few weeks' breathing time he found himself again face to face with the Federal army near Frederickburg early in November; on December 13 the enemy, having crossed the Rappahannock on the previous day, assailed his position in strength, but was defeated with great loss. In the following spring the hostile armies still faced one another on the Rappahannock, but the brilliant strategy of Lee, as exhibited in the battles at Chancellorsville (May 2-4), against vastly superior forces, resulted in the retreat of the enemy, while Lee was left free to resume his old policy of throwing the Federal forces on the defensive by an advance into Pennsylvania. He encountered the enemy near Gettysburg on July 1, and decided advantages were gained, but the struggle was renewed on the two following days with disastrous consequences to him: he retreated, however, in good order, and reached Virginia on the 12th, when the campaign of the year practically closed. That of 1864 began on May 4, when Grant crossed the Rapidan, the passage itself was unopposed, but his subsequent progress was hotly contested in a series of well-fought battles which did not prevent the Federal general from reaching the south side of the Appomattox. The siege of Petersburg began in June, and lasted until April 2, 1865. A week afterwards Lee surrendered with his whole army, thus virtually terminating the war. In the same year he was elected president of Washington and Lee university at Lexington, Virginia, which office he retained until his death on October 12, 1870.

The events of Lee's military career briefly indicated in this notice belong to the history of the United States, and will call for further notice in that connexion. To do justice to his extraordinary ability as a general, displayed under circumstances of extreme difficulty, when his movements were continually hampered by political necessities, as well by the lack of material resources, would require an elaborate military biography, it was never more nobly displayed than in the last hopeless stages of the fatal struggle. The personal history of Lee is lost in the history of the great crisis of America's national life; political friends and foes alike acknowledged the disinterestedness and purity of his motives, his self-denying sense of duty, and the unrepining loyalty with which he accepted the ruin of his party.

LEECH. The medicinal leech (*Hirudo medicinalis*, L.) is a species grouped under the family *Gnathodactylidae* (with a dental apparatus composed of armed muscular ridges) of the descriptitious *Aneides*. The body of a leech is spindle-shaped, and flattened dorsally and ventrally so as to be elliptical in transverse section. It is somewhat pointed in front except when the mouth is in action, while posteriorly it is terminated by a disk or sucker. The surface is marked by a series of annulations reaching from ninety-five to one hundred, but such are only cutaneous, as indicated by the gongyli, the segmental organs, the white spots on each side, and even by the arrangement of the two outer yellowish stripes, for the primary segments of the body comprise from three to five of these. The anterior sucker (fig. 1, *a*) is composed of four incomplete annuli and another surrounding the mouth, while the posterior (*a'*) has seven. The color of the dorsum is generally dull olive or olive-brown, with six yellowish, rusty, or greenish-yellow bands more or less interrupted with black, the spots of the latter being somewhat symmetrically arranged in the two outer rows. The ventral surface is speckled with black spots on a greyish ground. Several varieties occur, according as the dorsum is lighter or darker brownish or olive, and the ventral surface with or without spots. Thus Moquin-Tandon, Desing, and others indicate six or seven, each of which again has various subvarieties, ranging from two to five. Externally the body is invested by a thin translucent chitinous cuticle, which is perforated, apparently with some regularity, by the apertures of the glands. This coat is shed at intervals. Beneath is the hypoderm (epidermis of some), which is much firmer and thinner than in the Nemertea. It contains the pigment, though part of the latter intrudes into the subjacent layer, and is composed as usual of columnar granular cells, a horizontal section presenting a somewhat regularly areolated aspect. Rawlins Johnson alludes to the vascularity of the surface of the leech, and Day Lankester notes the extension of the capillaries into this layer. The latter has not been verified, even in the hypoderm of the snout, though preparations presenting such appearances are not uncommon. The hypoderm is closely united to the subjacent muscular layer, though it can hardly be said with Gegenbaur that it is continued into the parenchyma of the body. It is this layer and the cuticle which are marked by the superficial annulations. Various unicellular glands occur underneath the hypoderm, in particular two chief sets—superficial and deep. The former are situated amongst the outer (circular) muscular fibres and pigment, while the latter lie amongst the connective tissue, muscular fibres, and vessels that constitute

Fig. 1.—Medicinal Leech (*Hirudo medicinalis*, L.), after Moquin-Tandon and Hodgson. *a*, anterior sucker, *a'*, posterior sucker, *b*, first and second pairs of gongyli—directly approximated, *c*, first division of the alimentary canal, *d*, small intestine (most solid of Gubioles), *e*, eleven part of coeca (long and large), *f*, first part of the same, *g*, last part of the same, *h*, last part of the same, *i*, last part of the same, *j*, last part of the same, *k*, last part of the same, *l*, last part of the same, *m*, last part of the same, *n*, last part of the same, *o*, last part of the same, *p*, last part of the same, *q*, last part of the same, *r*, last part of the same, *s*, last part of the same, *t*, last part of the same, *u*, last part of the same, *v*, last part of the same, *w*, last part of the same, *x*, last part of the same, *y*, last part of the same, *z*, last part of the same.

the "parenchyma" between the muscular layers of the body-wall and the alimentary canal. It has been suggested that the former secrete the ordinary mucus, the latter the cocoons. Both open by ducts on the surface of the cuticle, and it is stated that those in the neighbourhood of the genital segments are enlarged at the time of oviposition. In the Nemertean it is the homologous of the leech's hypoderm which secretes the envelopment of the ova.

The muscular layers consist of external circular fibres in several strata, between which the hypodermic glands, pigment-cells, and vessels intrude. When this coat is examined in thin superficial (horizontal) sections the fasciculi are observed to be separated by intervals. Other circular fibres occur within the longitudinal layer. The latter muscles form the great mass of the body-wall, and are grouped into various bands by the connective tissue and radiating muscles. The latter pass directly from the dorsal to the ventral surface laterally, and thus become vertical fibres; and they are very well seen in *Nephele*, where they form four or five conspicuous bands between the circular layer dorsally and ventrally, and thus appear to have a considerable influence in determining the shape of the body. The extensible snout presents a muscular structure analogous to that of the tongue in the higher animals, and it is capable of even more extensive and varied movements. A complex series of muscles (circular, radial, and longitudinal) exists in connexion with the posterior sucker. The muscles of the leech are unstriated, and are formed of long spindle-cells with nuclei. The locomotion of the leech is affected by the alternate attachment of the suckers, or by swimming through the water like an eel. It is fond of waving its body to and fro in the water when attached by its posterior sucker, and this would certainly aid the secretion of the blood in the superficial vessels.

There is no special body-cavity, the blood-vessels and connective tissue alone occurring between the muscles and the digestive chamber. Rolleston speaks of dissepiments between the digestive diverticula, that between the last two not being prolonged to the ganglia. In the histology of the leech an important part is played by the connective tissue, which envelops all the organs, traverses the muscles, and is filled in certain places and in its cellular elements by brown granules. Moreover, certain of these cells are stated by Ray Lankester to form the walls of the blood-vessels.

^{Suctorial apparatus.} The inferior surface of the snout constitutes a spoon-shaped cavity leading into the mouth, which thus with its marginal lip is capable of forming a most efficient sucker. At the junction of the buccal with the pharyngeal region are a median dorsal and two lateral prominent semicircular or sometimes slightly hatchet-shaped elevations, which in contraction fit into pits in the wall. On the free edge of each of these muscular cushions the cutaneous buccal lining is furnished with a closely arranged and microscopic series of transverse processes (eighty or ninety in number), each of which somewhat resembles the middle valve of a *Chiton* or the upper jaw of *Ptycho*. They are arranged indeed after the manner of the ridge-tiles of a roof, the lateral pieces sloping downward on each side from the prominent median point. These angular transverse plates are separated by a well-marked interval, and they commence as small processes. They are distinctly calcified. It is these organs, mounted on the three muscular cushions, which cause the somewhat tridactylate wounds, and which may pass through the true skin to the cellular tissue, a feat which Poirer's notion of suction could hardly accomplish. Great ambiguity seems to run throughout text-books on this subject, and yet the figures of Brandt and Moquin-Tandon represent the condition very fairly, though some appear to have mistaken the lateral view of the muscular

cushion for a "horny jaw." These teeth can only act *en masse* with the muscular pad on which they rest, and have not the individual movement seen for instance in the long hook-teeth of certain polychaetes. As Leuckart and others have shown, each of these muscular cushions has a most complex structure. The superficial fibres are for the most part oblique, the central vertical (that is, at right angles to the teeth) and cut into lamellae by transverse fibres. The whole forms a very efficient motor apparatus for both cushion and teeth in all their varied functions.

The mouth opens into the pharynx, the structure of ^{of *Opus*} which, as in other *Gnathobdellids*, differs essentially from ^{Station} that of the *Rhynchobdellids*. In ordinary connected preparations the central canal in front is either triangular or tridactylate. Internally it is covered by the cuticular and the tough hypodermic layers, from which the radiating musclicles pass to the body-wall, the space between the hypoderm and the strong circular fibres of the organ being occupied by regularly arranged longitudinal fibres clasped by the radial fibres. The mixed muscular layer of the body-wall occurs outside the foregoing. The entire arrangement is well adapted for dilating, shortening, and lengthening the canal, and performing all the complex actions of a powerful suctorial apparatus. In the *Rhynchobdellids*, on the other hand, the protrusible proboscis, with its intussusceptive structure and its sheath, presents little in common with the foregoing. The pharynx terminates in the stomach, an elongated chamber having eleven lateral diverticula (*c* to *g*), which form short pouches directed backward on each side, with the exception of the posterior pair (*g*), which are so large and long as to be almost in apposition when distended, and nearly to reach the termination of the body. From the point of bifurcation the canal proper (*g*) is continued as a somewhat small tube—to end in an anus on the dorsum, immediately in front of the posterior sucker. The inner surface of the alimentary canal is lined by a minutely granular epithelium. Salivary glands have been described by various authors as situated in the parenchyma outside the pharynx, and the number of large granular glands in this region is certainly great. Digestion seems to be slow in leeches, and breeders feed them with blood only once in six months. It is well to remember that the alimentary canal contains blood in those brought direct from their native marshes.

The nervous system consists of twenty-three pairs of ^{Nerves} ventral ganglia, the first being connected by commissures, ^{and sense-organs.} (between which the gullet passes) with the supra-pharyngeal, or cephalic ganglia. An intermediate stomato-gastric ganglion sends branches to the central muscular cushion for the teeth, and another on each side gives twigs to the lateral cushions. The cephalic mass supplies the eyes and the cup-shaped sense-organs. The former, to the number of ten, are situated on the three anterior segments and on the fifth and eighth segments, the whole forming an ellipse, and their structure has been carefully investigated by Leydig and others. Dr. E. M. Gunn observed that in the leech they are formed of cup-shaped or bell-shaped depressions of the skin, surrounded by numerous pigment-cells. The fundus is furnished with large clear cells having peculiar nuclei. They are merely altered epithelial cells, and are found to be continuous with them. Between them in the axis of the cup is a space traversed by a nervous filament which pierces the fundus. According to Leydig this nerve-filament ends in a freely exposed papilliform elevation at the mouth of the cup-shaped eye. No connexion has been found between the nerve and the cells. Milne-Edwards, again, suggests that these refracting cellules are very like the principal cellules of the refracting cone of the retinal composite eye of insects. Near the

mouth of the sup Ranke figures retinal cones (Glaskorperkugeln), which are arranged like nerve end-organs in a mosaic, on a flat extension of the optic ganglion. These cones are very like those of the vertebrate eye, consisting of a somewhat rounded granular body, connected at the base with a nerve filament, and having a clear, stiff, rod-like projection on its outer part. Dr Gunn has been unable to see these cones or the termination of the optic nerve. The wall of the clear cell is very thick, and the "nucleus" is generally seen to be an inward projection of this wall ending in a knob-like enlargement. Where it appears free, that is probably due to the plane of section, the side or end of the knob being severed from its connexion. Besides the cells having this inward projection of the wall there are others containing highly refractive spherules like oil globules. Ranke observes how little these "optic cups" differ from the touch or taste organs scattered on the snout and sides of the animal, and he is of opinion that they probably serve equally for the three kinds of sensory perception (sight, taste, and touch). If Ranke's account is correct, and if the cone-mosaic situated at the mouth of the cup be directly stimulated by the rays of light, it is difficult to account for the function of the large clear cells, and more especially the pigment around. From the position of the pigment it cannot serve for the isolation of Ranke's elements, and it can hardly be required for the prevention of the confusion of images. Yet by its presence the eye of the leech is distinguished from the adjacent and very similar touch-organs. Dr Gunn is of opinion that the light acts on the pigment, and develops some form of energy which affects the contents of the cell, whence a stimulus is communicated to the nerve. Unfortunately a nervous connexion with these cells has not been found.

The three anterior pairs of ventral ganglia (b) coalesce into a single mass, and in the same way the last large ganglion (e') is composed of seven. The ordinary ventral ganglia give off two branches on each side, one of which has a small ganglion developed on it. The penultimate ganglion sends off only a single branch on each side, while the last gives off from seven to nine for the supply of the posterior sucker. The nerve-cells, as usual in these ganglia, are chiefly external, and the fibrous region internal, while the whole is surrounded by a neurilemma. This system has been the subject of many elaborate researches, amongst which those of Leydig and Hoffmann are conspicuous. A sympathetic or splanchnic nerve discovered by Brandt runs along the ventral surface of the digestive tract. In development it is found that in many leeches the long cords are originally separate, but afterwards come close together so as to resemble a single connecting cord.

The circulatory system presents a median dorsal, a median ventral, and two large lateral longitudinal trunks, all anastomosing with each other, and giving off numerous branches to the muscular layer of the mesoderm and various internal organs. The median sinus in the head surrounds the ganglia and oesophageal ring. It has a ventral development in the rest of the body, where it encloses the alimentary canal and the ganglionic nerve-cord. The blood-vessels have a well marked systole and diastole—from eight to ten times per minute. The fluid is red, and devoid of corpuscles. Old observers noticed the finely reticulated condition of the integuments when the vessels were injected, but, as formerly noticed, vessels could not be seen in the hypoderm proper. The active and free waving movements of leeches in the water when attached by the posterior sucker are probably connected with cutaneous respiration.

No part of the leech has caused more discussion than the series of seventeen pairs of segmental organs (g, g') which occur in a line external to the testes, and alternating in position with them. Some considered them respiratory, others

secretory, while a few connected them with the reproductive system. They consist of a muscular sac-like ciliated organ which communicates with the exterior near the posterior part of each primary segment, and externally of a loop-shaped gland, labyrinthine in structure, one end of which opens into the former sac, while a canal process is prolonged on each of the testes in their region. In minute structure it has been found that the cells which constitute the gland are all penetrated by ductules, which, however, do not communicate with the large duct in the axis of all the lobes (Bourne). The gland is surrounded by an elaborate plexus of blood-vessels. These organs are in the embryo preceded, in the posterior region of the body, by three pairs of looped canals, which disappear before the permanent ones are developed.

The leech is hermaphrodite, but congress of different individuals is necessary for reproduction, and therefore spermatophores, which ductules have a special covering, are found in the respective vaginas. The male organs consist of an intromittent apparatus (h) with a muscular and glandular basal structure (g), and a duct (f) on each side from the *vesicula seminales*. The latter has a *vas deferens* connecting it with the same globular testes (d, d', d'', d''') ranged along each side of the body, one of which is directed outward at the tip. The intromittent organ reaches the exterior at the junction of the first and second sixth of the body (between the twenty-fourth and twenty-fifth rings). The female apparatus is placed in the segment between the conical vesicles and the first testis, four annuli intervening between the respective sexual openings. The external opening of this system (between the twenty-fourth and twenty-fifth rings) leads into an oval sac (i), the vagina—furnished with thick muscular walls. A coiled oviduct passes from its apex through glandular tissue, which probably secretes the albuminous matter surrounding the eggs, and divides into branches, one leading to each ovary (j). In *Hirudo* the ovaries form a coiled filament, and on this the ovarian germs are lodged. The ova are connected with the filament by a thin envelope which is drawn out into a stalk. There is no cord in *Agelastus*, but the ovarian germs form groups of cells.

Three or four days after congress the leech may be observed to be contracted above and below the genital apertures, and an abundant secretion is poured out so as to surround this region of the body as in the Nemertean. Into this investment the contents of the female organs and their opaque gelatinous envelopment are forced. The animal disengages the anterior part of its body, withdraws its head, and the structure just mentioned slips into a cocoon, containing from five to eighteen ova, and frequently showing slight elevations at the points through which the body passed. The cocoons are deposited in cavities in the mud during the summer and autumn, and some seem able to deposit them during the winter. The ovoid cocoons consist of a network of spongy fibres, and indeed have been mistaken for a sponge. The older authors considered the leech viviparous until Noble and Rawlins Johnson observed the foregoing phenomena.

There is little difficulty in rearing leeches in confinement if a Leech proper method is followed, and accordingly various leech tanks and breeding ponds have been constructed. One of the largest schemes of the kind is a leech farm of 18 acres near Newton, Long Island, U. S. The breeding ponds are in oblongs, each of 14 acres in extent, and 8 feet or more in depth. The bottom is composed of clay, and the margins of peat. The cocoons are deposited in the soft peat from June onward, the chief cocoons being marked, water-sheds, and water-sheds, which dig the cocoons out of the peat. The adult leeches are fed every six months on fresh blood placed in linen bags suspended in the water. It is also the opinion of some that leeches which have been filled with blood make good breeders.

In regard to the development of the *Planoides*, *Apeloides*, *Devotop*, perhaps, has been more completely worked out than *Hirudo* (though many observations of Weber, Leuckart, Robin, and others on the latter are important), and, as the former very much resembles the latter, except in the presence of eia in the embryo anteriorly, a brief notice of it will suffice. Butschli describes the usual divisions of the eggs, which need not be given in detail, especially as an excellent summary is to be found in Balaban's *Comparative Embryology*. According to these authors the cells which constitute the epiblast give origin to others which form the hypoblast and vitelline sphaera. Two patches of epiblast gradually spread over the vitelline sphaera. Then the hypoblast cells increase and fill up a space bounded behind by three vitelline sphaerae and in front by the epiblast of the anterior end. At the sides of the hypoblast the mesoblast has become established, probably as two lateral bands. The hypoblast cells range themselves round a central cavity, increase, and become filled with food-yolk. The mouth and thick-walled oesophagus are then developed, probably by epiblastic invagination.

The mesoblast now forms two lateral curved bands at the sides of the body. The three vitelline spheres become covered with the flattened cells of the epiblast. The cephalic region becomes chitinous, and the chila enter the oesophagus. The epiblast develops the outside, which is raised into transverse rings, without, however, having any relation to the true segments of the mesoblast. The nervous system is probably derived from the epiblast, the ventral cord breaking up into a series of ganglia, which correspond with the true somites, except that the first and last, as already mentioned, are composed of several. The supra-oesophageal ganglia arise independently. The mesoblast probably takes its origin from the two mesodermic bands, and the segments formed by it grow upward and meet in the dorsal line, and septa are formed between the somites. The somatic layer of the mesoblast gives rise to the muscles. The mesoblast also gives origin to the excretory (segmental) and generative organs, and the vascular system. A delicate musculature, however, would appear to be developed independently of the mesoblastic bands. The mouth and pharynx are formed by the epiblast; the rest of the oral by the hypoblast, which from the first has a sac-like shape. The posterior oesaculation of the stomach in *Hirudo* is originally unpaired. The dental pads are formed about the same time as the eyes as protuberances of the oral cavity. The anus is developed very late about the posterior sucker. In the embryo of *Hirudo* Leuckart found three pairs of segmental organs at the posterior end of the body, consisting of an enlargement from which a convoluted tube is continued for some distance backward, and then bends forward to open on the exterior. The anterior part is broken up into a labyrinthine network. These organs disappear in the adult. The recent researches of Whitman on *Oligone* and of Hoffmann have greatly extended our information with regard to the histology and morphology of the parts in the embryos of the leeches.

The time between the deposition of the ova and their hatching is variable, and probably depends, as in the ova of the *Salamandra*, on temperature and other causes. It is said to range from twenty-five to forty days. The young arrive at perfect coloration when two years old, and become sexually mature at three years, about which age they become fit for medicinal use, their food consists at first of microscopic organisms, and afterwards, when the mouth has attained more complete development, of the larvae of insects and other small animals.

There is no animal that has been more prominently brought under notice than the leech, both on account of its use in medicine from very early times, and its fitness for anatomical and other investigations. The study of its structure, internal, external, and structural, that have been devoted to it is a very considerable one of these voluminous articles in Brandt and Reibenburg's *Medicinal Zoologie* may be taken as a type.

Medicinal use. This leech is the *Bædæa* of Herodotus, Theocritus, Nicander, and other Greek authors, and the *Hirudo* and *Sanguisuga* of Plautus, Cicerone, Horace, Pliny, and other Roman writers. Celsus Aretæus mentions its use, and Galen and his successors recommend its application. Apollonius also alludes to the latter, and describes very graphically the process by which it fills itself with blood. It was sufficiently familiar to naturalists both before and after the time of Linnæus, though occasionally there has been considerable ambiguity in regard to species. The use of the leech is mainly for local blood-letting, but in modern times the practice has greatly diminished; indeed, in some cities the druggists chiefly use them with doubtful efficiency in cases of ineffectual gumboil and in facial ecchymosis. They may be applied to any part of the adult skin, and to the mouth, fœces, and other available inlets by the aid of a leech-glass, which consists of a tube with a slightly contracted aperture, and provided (or not) with a glass piston to push the leech onward. In China a piece of bamboo serves the same purpose. For such functions the most active specimens should be chosen (and, as Sir Robert Christison states, these contract firmly when squeezed in the hand) and kept for an hour out of water, and then applied to a perfectly clean surface of skin. They may also be made to bite by smearing the skin with cream or blood, or by immersing the leech for a minute in porter or tepid water. Each fills in about fifteen minutes, and draws from 40 to 85 grains of blood, or, including that afterwards obtained by fomenting the wound, about half an ounce. In young children they should never be placed on parts where firm pressure cannot be applied. It was formerly the practice to prepare the leeches that had been

used for further action by sprinkling a few grains of salt on the snout, and stripping them gently between the fingers so as to cause them to eject the blood. This plan is not now adopted, and rightly so, since various diseases might thus be communicated. They certainly can be applied four and five times in succession by placing them in vinegar and water, and afterwards in a vessel (which the French call a domestic marsh) with turfy earth, but they draw less blood on the fifth occasion. Should the hemorrhage from the wounds (as in certain constitutions) prove severe, it may be stanchied by the application of vinegar, solid nitrate of silver, a hot wire, or a hot solution of alum, or by acupuncture. If a leech by accident be swallowed, a pretty strong solution of common salt, or a glassful or two of wine may be taken. Instead of the actual leech an instrument called an artificial leech is now sometimes used. This consists of a small sharp steel cylinder (worked by a spring) with which a circular incision can be made through the skin, and a glass cylinder capable of being exhausted by a piston worked by a screw. Care must be taken to move the piston at about the same rate as the blood flows, and the edge of the glass cylinder should not press too tightly, else the flow is arrested.

Leeches are imported from France and Hungary, and also through Hamburg from Poland and the Ukraine; they likewise come from Turkey, Wallachia, Russia, Egypt, and Algeria. They are found in Britain—both in Scotland and England, but especially in the latter. In the French trade Bordeaux leeches are preferred, Polish, Swedish, and Hungarian are those most commonly met with in Britain. It is difficult to estimate the number of leeches now used. In 1846 Moquin-Tandon calculated that there were from twenty to thirty millions used in France; and Leuckart mentions in 1863 that in London seven millions, and in the Parisian hospitals five to six millions, were annually employed. At the great American leech-farm the average sale is one thousand per day. There cannot be a doubt, however, that the use of leeches at the present time is greatly restricted—indeed, the younger generation of British medical men seldom or never prescribe them—so that scarcely one will now be employed where one hundred were a quarter of a century ago. This is very well shown in a note from Messrs Duncan, Flockhart, & Co. of Edinburgh, from which it appears that the account for leeches supplied during three months in 1844 to the Royal Infirmary, Edinburgh, was £45. This steadily decreased until about 1868 it amounted for the same period only to 5s. 6d. Sir Robert Christison mentions that the price of the best leeches in 1845 ranged from £4 to £8 per thousand; twenty years ago they were from £10 to £15 per thousand; and at the present time good leeches cost about 10s. per hundred, or £5 per thousand.

They inhabit ditches and ponds, with pure running water, weeds for shelter, and muddy banks and bottom. They are captured by nets after attracting them by bait, or by wading into the water, and then stripping them off the legs on coming to land. Leeches are preserved in loose turf or moss constantly moistened, or in earthenware or glass vessels half full of water, covered with glass or linen-gauze; and some place a rusty nail, others a clean sponge in the vessel, which can be exposed to the light. In transporting them the French "domestic marsh," a vessel with small perforations inferiorly and filled with moist turfy earth or peat made into a stiff mud, is excellent. Sometimes an exterior vessel with a few inches of water is placed round the former. The mouth of the vessel is closed with a coarse linen cloth. Leeches, like many other annelids, live for several years without food in vessels of pure water.

Classification

The group (*Hirudines* or *Dusaphoi*) may be divided into three families, viz., *Rhynchobdellidae*, *Gnathobdellidae*, and *Planorbidae*.

The *Rhynchobdellidae* are those leeches furnished with a protrusible proboscis (which is often everted) if the animal is removed from the water and placed on a dry surface. This family includes the fish-leeches (*Egghydrobia*), which have an anterior and posterior sucker, a simple intestine, and mostly two pairs of eyes. Amongst these are *Piscicola grometta*, L., found on freshwater fishes, *P. appropinquans* on the habitat, and *P. sepium*, in which the body has lateral sacs into which the blood enters. The mentioned (*P. grometta*) is a somewhat beautiful species, and full of activity, waving its body to and fro, and floating by aid of the expanded posterior sucker on the surface of the water. Another well-known genus (*Pontobdella*) is characterized by its thick warty skin, and four rings to each segment. The best-known example is the skate-leech (*P. newmani*, L.), which is olive-colored and dotted with whitish grains. The anterior sucker is furnished with papillae round its edge. It adheres to the skin of the skate, and deposits the curious pedicled hairy capsules, containing a single egg, inside shells. In the same group is the remarkable genus *Branchellion*, which has a narrow anal ring with the sexual orifice at its posterior part, and a series of lateral appendages, the function of which has been supposed to be hanchal. Its stomach is sacculated. One species (*B. torpense*, Sav.) is a mesomate of the torpale or electric ray of the Mediterranean, this has been the subject of very interesting papers by Leydig and De Quatrefages. The next subfamily—the *Olepaninae*—have somewhat broad bodies capable of being everted downwards at the margins so as to form a hollow vaginal groove for the lodgment of the eggs and the young, while the vent is pointed. They have from one to four pairs of eyes, and three rings to each segment. The dorsal blood-vessel is rhythmically contractile, and the median blood-sinus envelope the digestive canal and the ventral nervous. The stomach is bunched, and the anus opens above the posterior sucker. The skin in many is warty and in the *Olepana echinata* of Grube, from Lake Baikal, the dorsal papillae are furnished with soft pointed processes, so that in outline they are spinulose. The oviducts have no common tract or vagina, but open at the fourth pair. The genital apertures occur between the twenty-fifth and twenty-seventh, and between the twenty-seventh and twenty-eighth rings. The ova are in some kept under the body till hatched. Several species abound in the fresh water lakes and ponds of Britain, and their remarkable and beautiful anatomical structure is yet in need of elucidation. Amongst those most commonly met with is *Olepana bosciana*, Sav. (fig. 2), which is about an inch in length, generally

green or pale brown appearance, often with two (sometimes four) interrupted dark brown bands along the middle of the dorsum, in which are pale papillae, four rows of the latter being generally present. The eyes are six in number, in parallel series. The body is firm, and the cutaneous at the sides are brown striated. There are six glands on each side, and in the young the setrum is everted. The proboscis is a cylindrical organ slightly narrowed anteriorly and posteriorly, and banded with transverse striae, a festoon in *O. bosciana* due to the arrangement of the granular nucleated glands on its inner surface. It looks on *Phoronis* and *Lumina* (coel and non-shells). *Olepana heterostyla*, L. (fig. 4), a somewhat smaller form, is characterized by its translucent yellowish aspect. The dorsum is rarely regularly dotted with blue brownish, so as to give it a checkered appearance. The snout is acute, and is furnished with six eyes, the anterior pair being closely approximated, while the two succeeding are separated by an interval from the foregoing, and the eyes in each pair are at a greater distance from each other. The digestive canal are beautiful objects from their regularity and complexity. The ova are carried on the under surface of the body. It is less active than *O. complanata*. Another form very abundant under flat stones in similar lakes and ponds in certain places is *Olepana bosciana*, O. F. Müller (fig. 5), a large

has a greenish-grey hue, and is much tapered anteriorly. Two closely approximated eyes occur in front. There is a reddish-brown body on the eleventh ring, making an aperture described by O. F. Müller, and a whitish opacity in front of it. It often fixes itself by the posterior sucker, and waves its body to and fro in the water, and it swims actively like a Nematode or horse-leech. The ova and young are carried in groups on the abdominal surface. It contracts itself into a ball on irritation. Its food consists of fluviatile and lacustrine mollusks, especially of *Physa* (bubble-shells). *Olepana complanata*, Sav. (fig. 3), again, is distinguished by its greenish-

and conspicuously tinted form. It reaches the length of 3 inches, and is of various shades of green, brownish, or olive, with six rows of yellowish or whitish spots, the marginal in all cases being the largest, while the four internal occupy papillae. The eyes are eight in number in two series approximated in front. The soft, mobile, and almost gelatinous body is capable of assuming endless shapes, and is sometimes like a cordate leaf. It is gregarious in confinement. When a specimen is detached from its own adjacent mass of ova, it occasionally selects another group and fixes itself to the glass to nurse them. The young are borne on the ventral surface (fig. 4). The genus *Hemidusa* has two eyes, a bifid anterior sucker with the mouth in front, a long pointed proboscis, and five rings in each segment. The species (*H. mexicana* and *H. affinis*) occur in the Mexican lakes and South America, the latter being used medicinally, since it is capable of penetrating the skin with its pointed proboscis.

The second family, *Gnathobdellidae*, includes the medicinal leech, besides *Hirudo intermedia* (M. Tard.) from Algeria, *H. javanica* from Java, *H. sinica* (Blauy) from China, *H. quinquata* (Schim.) from Sydney, and others to be subsequently mentioned. *H. dentata* (Say), the native leech of North America, is used in the same way as *H. medicinalis*. It is bluish, with about twenty-two reddish points on the dorsum and a lateral series of black touches of the same number. The ventral surface is ridged with black points. It also compresses the genus *Bdella*, without dentacles, and *Hemiphaedra*, the best-known example of which is *H. variegata*, a kind of horse-leech which is very troublesome to horses, cattle, and camels, by entering their nostrils when drinking, and the same disagreeable accident occurred to the French soldiers in Egypt. The common horse-leech (*Ambystomum naja*, M. Tard.) with very distinct dorsal

lateral ends of the stomach, but with two long posterior caeca, is abundant in British ponds and lakes, as also is *Nepheleis vulgaris*, L. (fig. 7), a species about 3 inches in length. Its dorsum is brownish-yellow, often with a conspicuously tessellated appearance, while the under surface is pale olive. The eyes are eight—four being placed somewhat in a semicircle, and four a short distance behind, wide apart and at a different angle. It is a voracious test-les, keeping up an undulating motion of its body when attached by the posterior sucker, apparently as in the *Phyllodoceae*, to promote respiration. It also swims on edge through the water like an eel. The skin is exceedingly sensitive to the vapour of chloroform, while the contact of a single drop causes tetanic convulsions, and the animal dies, quite rigid. The digestive canal is nearly simple, and there are no buccal teeth. The dorsal blood-vessel is absent. The ova are deposited in a horny capsule fixed horizontally to sub-aquatic structures, and it is curious that Linnaeus described it as a hemipteron insect under the name of *Coccyx aquaticus*. On

Beignemann's paper in which the enail was corrected the great Swede wrote "*Nepheleis* feeds on earthworms, larvae, mollusks, and other organisms." *Typhlocyba sub-ventralis*, Dufschollet, is a large burrowing form (7 inches in length), which frequents the marshes and ditches of France and Algeria (and also usually, apparently from introduction, in England). It leaves the water to follow the earthworms on which it feeds. There are no buccal teeth, and the alimentary tube is only slightly ciliated. In Ceylon the *Hirudo* *capitata* or *capitata*, a land-leech about an inch

long, is a great annoyance to travellers, especially in the rainy season, attacking men and horses when journeying through the woods and jungles, and causing considerable irritation from its bites. They come in troops out of the grass and dead leaves, and one cannot leave the ground in the garden in some places without being attacked. Leech-garrets, themselves, are worn by many residents for protection. A similar form occurs at an elevation of 4000 feet in the Philippines, and others in Java and Sumatra, and Sir Joseph Hooker found them at a height of 11,000 feet on the Himalayas. Land-leeches also exist in Australia, Japan, and China, where very few occur in the water. They frequent plants, trunks of trees, and shrubs, as well as grass. An eyeless leech, called *Typhlocyba*, inhabits the subterranean waters of the Runda cave in Hungary. An all-but eyeless form, *Cyathobella tumida*, Grube, which was found by Fritz Müller in Brazil, lives in damp earth. It has a slender spindle-shaped outline. The exact position of the gigantic *Monobdella* *maliniana* of Filippi, a South American leech measuring about 24 feet, is uncertain. It is eyeless, and has neither lips nor teeth. It probably lives in damp earth, and feeds on earthworms.

In the third family, Branchiobdellidae, the irregularly annulated body is elongated, somewhat cylindrical, with a bulbous eyesless snout, and a sucker at the posterior end. There is no proboscis, but the pharynx has two flattened ciliated parts (dorsal and ventral). The body is provided with a celom or body-cavity, an unusual feature in the leeches. The alimentary canal is simple. There are only two longitudinal vessels, trunks—a dorsal and a ventral, the former showing a dilatation behind the cephalic branches, sometimes termed a heart. Two pairs of segmental organs are present, the posterior pair of which are modified for the conveyance of the oxygen products to the exterior; for the oves, which are situated far back, discharging their contents into the body-cavity. The best known are *Branchiobdella* *caecata*, Ocher, and *B. parvica*, Haeckel, which occur as ectoparasites—the former (smaller) on the branchiae, the latter under the tail and on the antennae and eyes, of the crayfish. *Myxobdella*, Leidy, and *Ternstrophiella*, Gay, are allied forms. The latter is a curious leech, having five digitate processes attached to its anterior end, and which a pair of eyes and the mouth are situated. A sucker exists posteriorly. In the same family are placed the aberrant types *Acanthobdella* and *Hirudo*. The former is characterized by a somewhat flattened spindle-shaped body resembling a Cephyaean, bluntly pointed in front, furnished with minute hooks near the anterior end, and a posterior sucker.

The *A. pulchella*, Grube, a fish-parasite from Surin, is an example. The latter (*Hirudo* *abdominalis*) are remarkable in the group in being dioecious instead of hermaphrodite, and somewhat resemble in outline grotesque insect-larvae. The peculiar back-like hump fitted for suction, the jointed body, and the pair of posterior suckers are characteristic. They are ectoparasites on marine crustacea, thus *Hirudo* *abdominalis*, Van Beneden, occurs on the lobster, and *Saccobdella* on other decapods.

Formerly *Udonella* and *Entobdella* were included under the leeches, but they seem to be more correctly placed amongst the Trematodes. Until lately *Entobdella* was also considered one of the group, but its ciliated skin, separate re-prods, proloca, and development point it out as an intermediate type allied to the Nematodes.

The following works amongst others may be referred to for more detailed accounts of the order.—Noble, *On the Medical Leech*, 1832; Blandin, *Recherches sur les Verses*, 1839; Miquel-Tenon, *Mémoires de la Société de Médecine*, 2d ed., Paris, 1850; B. Lichten, *Die Natur der Leechen*, vol. 1, 1860; Sir J. D. Doherty, *Parasites of the Crustacea*, 2d ed., 1883; G. Johnston, *Catalogue of Parasites*, British Museum, 1885. Also the various memoirs of Cuvier, M. Thomas, Delle Chimie, Gmelin, H. Rabbat, Van Beneden, F. Leidy, E. Grube, Krieger, Leidy, Villot, Doherty, Konner, Schneider, Hoffmann, Hermann, Whitman, Bousquet, Ray Lankester, and Rando. (W. G. M.)

LEECH, JOHN (1817-1864), the most genial of the humorous dialects of our century, was born in London on the 29th of August 1817. His father, a native of Ireland, was the landlord of the London Coffee House on Ludgate Hill, "a man," on the testimony of those who knew him, "of fine culture, a profound Shakespearean, and a thorough gentleman." His mother was descended from the family of the famous Richard Bentley. It was from his father that Leech inherited his skill with the pencil, which he began to use at a very early age. When he was only three, he was discovered by Flaxman, who had called on his parents, seated on his mother's knee, drawing with much gravity. The sculptor pronounced his sketch to be wonderful, adding, "Do not let him be cramped with lessons in drawing, let his genius follow its own bent, he will astonish the world,"—an advice which was strictly followed. One of his early productions, a mail-coach, done when he was six years old, is already full of surprising vigour and variety in its galloping horses. Leech was educated at Charterhouse, where Thackeray, his lifelong friend, was his schoolfellow, and at the age of sixteen he began to study for the medical profession under Mr Stanley at St Bartholomew's Hospital, where he won praise for the accuracy and beauty of his anatomical drawings. He was then placed under a Mr Whittle, an eccentric practitioner, the original of "Rawkins" in Albert Smith's *Adventures of Mr Ledbury*, and afterwards under Dr John Cockle, but gradually the true bent of the youth's mind asserted itself, and he drifted into the artistic profession. He was eighteen when his first designs were published, a quarto of four pages, entitled *Exchange and Sketchings by A. Pen, Esq.*, comic character studies from the London streets. Then he drew some political lithographs, did rough sketches for *Bell's Life*, produced an exceedingly popular parody on Mulready's postal envelope, and, on the death of Seymour, applied unsuccessfully to illustrate the *Punch* Papers. In 1840 Leech began his contributions to the magazines with a series of etchings in *Bentley's Miscellany*, where Cruikshank had published his splendid plates to *Jack Sheppard* and *Oliver Twist*, and was illustrating *Guy Fawkes* in sadly feeble fashion. In company with the elder master Leech designed for the *Illustrated Legends* and *Stanley Thorn*, and till 1847 produced many independent series of etchings. These, however, cannot be ranked with his best work; their technique is exceedingly imperfect, they are rudely bitten, with the light and shade out of relation; and we never feel that they express the artist's individuality, the *Richard Savage* plates, for instance, being strongly reminiscent of Cruikshank, and "The Dance at Stamford Hall" of Hablot Browne. In 1845 Leech illustrated *St Giles* and *St James* in Douglas Jerrold's newly started *Shilling Magazine*, with plates more vigorous

and accomplished than those in *Bentley*, but it is in subjects of a somewhat later date, and especially in those lightly etched and meant to be printed with colour, that we see the artist's best powers with the needle and the acid. Among such of his designs are four charming plates to Dickens's *Christmas Carol*, 1844, the broadly humorous etchings in the *Comic History of England*, 1847-48, and the still finer illustrations to the *Comic History of Rome*, 1852,—which last, particularly in its minor woodcuts, shows some exquisitely graceful touches, as witness the fair faces that rise from the surging water in "Cicilia and her Companions Escaping from the Etruscan Camp." Among the other etchings which deserve very special reference are those in *Young Master Troublesome* or *Master Jacky's Holidays*, and the frontispiece to *Hints on Life, or How to Rise in Society*, 1845,—a series of minute subjects linked gracefully together by coils of smoke, illustrating the various ranks and conditions of men, one of them—the doctor by his patient's bedside—almost equaling in vivacity and precision the best of Cruikshank's similar scenes. Then in the fifties we have the numerous etchings of sporting scenes, contributed, along with woodcuts, to the *Handley Cross* novels.

Turning to Leech's lithographic work, which succeeded the early political caricatures already mentioned, we have, in 1841, the *Portraits of the Children of the Mobility*, an important series dealing with the humorous and pathetic aspects of London street Arabs, which were afterwards so often and so effectively to employ the artist's pencil. Amid all the aqualor which they depict, they are full of individual beauties in the delicate or touching expression of a face, in the graceful turn of a limb. The book is scarce in its original form, but in 1875 two reproductions of the outline sketches for the designs were published,—a lithographic issue of the whole series, and a finer photographic transcript of six of the subjects, which is more valuable than even the finished illustrations of 1841, in which the added light and shade is frequently spotty and ineffective, and the lining itself has not the freedom which we find in some of Leech's other lithographs, notably in the *Fly Leaves*, published at the *Punch* office, and in the inimitable subject of the nuptial couch of the Caudles, which also appeared, in woodcut form, as a political cartoon, with Mrs Caudle, personated by Brougham, disturbing by untimely loquacity the slumbers of the lord chancellor, whose haggard cheek rests on the wool-sack for pillow.

But it was in work for the wood-engravers that Leech was most prolific and individual. Among the earlier of such designs are the illustrations to the *Comic English* and *Latin Grammar*, 1840, to *Written Caricatures*, 1841, to Hood's *Comic Annual*, 1842, and to Albert Smith's *Wassail Bowl*, 1843, subjects mainly of a small vignette size, transcribed with the best skill of such woodcutters as Orrin Smith, and not, like the larger and later *Punch* illustrations, cut at speed by several engravers working at once on the subdivided block. It was in 1841 that Leech's connexion with *Punch* began, a connexion which subsisted till his death on the 29th of October 1864, and resulted in the production of the best known and most admirable of his designs. His first contribution appeared in the issue of 7th August, a full-page illustration—entitled "Foreign Affairs"—of character studies from the neighbourhood of Leicester Square. His cartoons deal at first mainly with social subjects, and are rough and imperfect in execution, but gradually their method gains in power and their subjects become more distinctly political, and by 1849 the artist is strong enough to produce the splendidly humorous national personification which appears in "Dissociated Measuring the British Lion." About 1845 we have the first of that long series of half-page and quarter-page pictures of

life and manners, executed with a hand as gentle as it was skilful, containing, as Mr Ruskin has said, "admittedly the finest definition and natural history of the classes of our society, the kindest and subtlest analysis of its foibles, the tenderest flattery of its pretty and well-bred ways," which has yet appeared,—a series far too popular and too voluminous to require or admit of particular description here. In addition to his work for the weekly issue of *Punch*, Leech contributed largely to the *Punch* almanacs and pocket-books, to *Once a Week* from 1859 till 1862, to the *Illustrated London News*, where some of his largest and best sporting scenes appeared, and to innumerable novels and miscellaneous volumes besides, of which it is only necessary to specify *A Little Tour in Ireland*, 1859, which is noticeable as showing the artist's treatment of pure landscape, though it also contains some of his daintiest figure-pieces, like that of the wind-blown girl, standing on the summit of a pedestal, with the swifts darting around her, and the breadth of sea beyond.

In 1862 Leech appealed to the public with a very successful exhibition of some of the most remarkable of his *Punch* drawings. These were enlarged by a mechanical process, and coloured in oils by the artist himself, with the assistance and under the direction of his friend Mr J. E. Millsais.

After even such a necessarily incomplete enumeration as we have made of Leech's many designs, it goes without saying that he was a singularly rapid and undisturbable worker. Canon Hole tells us, when he was his guest, "I have known him send off from my house three finished drawings on the wood, designed, traced, and rectified, without much effort as it seemed, between breakfast and dinner. The best technical qualities of Leech's art, his unerring precision, his unflinching vivacity in the use of the line, are seen most clearly in the first sketches for his woodcuts, and in the more finished drawings made on tracing-paper from these first outlines, before the characatures were added and the designs were transcribed by the engraver. Turning to the mental qualities of his art, it would be a mistaken criticism which looked him as a comic draftsman. Like Hogarth he was a true humorist, a student of human life, though he observed humanity mainly in its whimsical aspects,

"Fitting all he saw with shafts
With gentle satire, kin to charity,
That burns not."

The earnestness and gravity of moral purpose which is so constant a note in the work of the last century master is indeed far less characteristic of Leech, but there are touches of pathos and of tragedy in such of the *Punch* designs as the "Poor Man's Friend," 1846, and "General Fervier turned Traitor," 1855, and in "The Queen of the Arena" in the first volume of *Once a Week*, which are sufficient to prove that more solemn powers, for which his daily work afforded no scope, lay dormant in their artist. The purity and manliness of Leech's own character are impressed on his art. We find in it little of the exaggeration and grotesqueness, and none of the fierce political enthusiasm, of which the designs of Gillray are so full. Compared with that of his great contemporary George Cruikshank, his work is restricted both in compass of subject and in artistic dexterity.

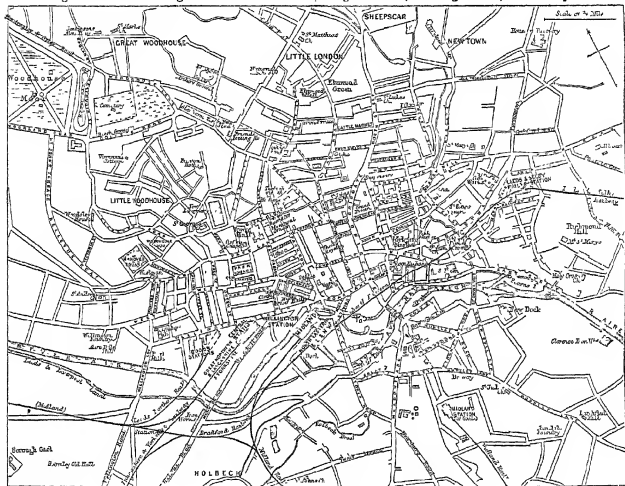

No formal biography of Leech has yet appeared, but interesting particulars regarding his life and works will be found in the following articles:—"John Leech's Pictures of Life and Character," by Thackeray, *Quarterly Review*, December 1854; "John Leech," by Dr John Brown, *North British Review*, March 1865, republished, with additional chapters by Canon Hole, in new edition of Dr Brown's essays (1892); letter by John Ruskin, *Arrows of the Chase*, vol. i. p. 161; *Conrad Massacre*, December 1864; *Scribner's Monthly*, vol. xvi. p. 158; "On Humorous Art," by Ernest Chesnut, *Gaude dei Bonis Arte*, 1875 (J. M. G.).

LEEDS, a town of England, in the West Riding of Yorkshire, the metropolis of the woollen manufacture, and in point of population only exceeded by London, Liverpool, Manchester, and Birmingham. Leeds is situated nearly in the centre of the West Riding, in the wapentake of Skyrack, and in the pleasant and well cultivated valley of the river Aire. The surrounding country possesses much cheerful beauty; and the view from Woodhouse Moor, one of the most elevated parts of the borough, is not excelled in any part of the Riding. For manufacturing and commercial purposes, the situation of Leeds is highly

advantageous. It is distant from London by the Great Northern Railway 185 miles, from Edinburgh 226, from Liverpool 74, from Manchester 42½, and from Birmingham 113, and may be said to occupy a central position in the railway system of England. It has also communication with Liverpool by the Leeds and Liverpool Canal, and with Hull by the Aire and Calder navigation, and through these means of transit has the highest facility for the transmission to the principal seaports of England of its various manufactures, and for receiving raw material at the lowest rate of charge. It is, moreover, the centre of an extensive coal and iron district. All the advantages for the successful working of machinery are therefore within its reach, and hence it has become the seat of several important industries, especially the woollen and linen manufactures, iron working, and machine-making.

Though regarded as the capital of the great manufacturing district of the West Riding, Leeds is not in its centre, but on its border. Eastward and northward the country is wholly agricultural, while to the west and south-west the populous villages resound with the shuttle and the steam-engine. In this district are carried on a woollen manufacture of great extent and of considerable antiquity and a worsted manufacture of extraordinary vigour (a graft on the woollen manufacture), to these have lately been added the iron manufacture and that of machines and steam-engines, and the making of boots and ready-made clothing, besides a manufacture of flax, which now constitutes one of the staple trades of Leeds.

Cloth is the staple trade of the town, although the manufacture itself is not the leading one within the borough, being carried on, to a large extent, in townships out of the

Plan of Leeds.

parish and borough of Leeds. In the town, however, the trade centres, and there the cloth is finally prepared for the market by what is technically termed finishing or dressing—a department quite distinct in Leeds from that of the manufacturer. In this respect the Yorkshire cloth trade differs essentially from that of the west of England, where the manufacturer conducts the two operations of making and finishing the cloth within the same premises. Several Leeds firms conduct their business on the west of England model, but, as the rule, the order of the trade is as follows. The great bulk of the cloths sold in Leeds are produced either in the out-townships of the borough, or in the villages lying west of Leeds, and principally in Pudsey, Farsley, Rawden, Yeadon, Horsforth, and Gumsley, which are all in other parishes, within an extreme radius of 10

miles from Leeds. The cloths so manufactured are sold in the unfinished or *ball* state to the merchants of Leeds, by whom they are put out to the cloth-dressers or finishers, whose special craft it is to raise the pile or nap on the face of the cloth, and to complete it for the purposes of the tailor and the final consumer. In former times a considerable proportion of the business between the manufacturer and the merchant was conducted in the cloth halls, which are two in number. In these the manufacturers formerly took their stand and waited the custom of the merchants, but within the last twenty or thirty years a great change has taken place in the mode of transacting business, and the cloth halls have practically fallen into disuse. The merchant now orders his goods direct from the manufacturer, specifying the weight, colour, and quality

of the articles he wants, and these are delivered to him without passing through the mills. Thus a picturesque and characteristic feature of life in Leeds seems likely at no distant date to become extinct. At one period it seemed probable that the business of the cloth trade would assume the west of England type. Mr William Hirst, a very skilful manufacturer, introduced goods of superior texture and quality, and by his success induced many capitalists to erect mills on a large scale, in which all the processes of the manufacture and finishing were conducted. The change was, however, only temporary. Many of these mills are now occupied for finishing only, and some have been devoted to other branches of the local manufactures. The spinning of flax by machinery was commenced in the township of Holbeck (in the borough of Leeds) more than one hundred years since, by Mr John Marshall, who was one of the first to apply the principle of Sir Richard Arkwright's water frame, invented for the cotton manufacture, to the spinning of linen yarn. The works of Messrs Marshall & Company are very extensive, and one portion of them is an object of attraction to all strangers visiting the town. It is a vast room 400 feet by 220, filled with machinery, all of which is turned by shafting which requires two coupled engines of 350 horse-power to impel it. Light is admitted by glass cupolas. The whole building is held together by a double series of iron ties, uniting the iron pillars which sustain the many-arched roof. The external form is Egyptian.

The spinning of worsted yarn and the weaving of worsted goods were formerly carried on to a considerable extent in Leeds, but have now nearly died out, Bradford, Bingley, and Keighley, with the villages immediately adjoining, having attracted almost the entire trade. Amongst the smaller branches of the textile manufactures carried on in Leeds must be enumerated those of silk and carpeting, neither of them unimportant, though falling short of the flax and woollen trades.

It is probable that the iron trade in its different branches, including the casting of metal, and the manufacture of steam-engines, of steam-ploughs, of machinery of every kind, and of mechanical tools, now gives employment to a larger number of persons within the borough of Leeds than any other branch of industry. The great works founded by the late Sir Peter Fairbairn, as well as those of Messrs Kitson & Co. and of Messrs John Fowler & Co., in the last-named of which the Fowler steam-plough is the staple article of manufacture, occupy places in the front rank of such establishments in the country, while Messrs Greenwood & Batley and other tool-makers give employment to a large number of hands, and export the goods they produce to all parts of the globe.

Leeds was at one time famed for the production of artistic pottery, and very fine specimens of old Leeds ware are still occasionally to be discovered among the residences of the poor in the town. This branch of manufacture, however, became extinct about eighty years ago. Within the last three years it has been revived, and once more attention has been directed to the high artistic merit which the pottery of the town has attained.

In addition to these particular branches of industry, the manufacture of ready-made clothing has become one of great importance. In some of the establishments for this purpose such as that of Messrs John Barrow & Sons, the number of hands employed is so large that from a thousand to twelve hundred suits of clothing can be produced daily. Machinery is now used in all the departments in these places, and the work is conducted with a rapidity and at a price which would have seemed incredible thirty years ago. Leeds has in recent years become famous as the chief seat of the cap manufacture in the United Kingdom.

The leather trade is also one of great importance in the borough, many large tanning establishments being erected on the outskirts, while the wholesale manufacture of boots and shoes for army and other purposes is carried on in workshops which are the largest of their kind in the United Kingdom.

No religious census has been taken in Leeds since that of 1851. There are, however, 181 places of worship in the town, these being divided as follows—Church of England, 10; Wesleyan Methodist, 40; Primitive Methodist, 20; United Methodist Free Church, 12; Congregational, 12; Baptist, 11; Methodist New Connexion, 10; Catholic, 8; Unitarian, 3; Presbyterian, 2; Friends, 2, various, 6. The Leeds school board, which was established immediately after the passing of the Education Act in 1870, has now (1882) 47 schools under its control within the limits of the borough, and these accommodate 80,000 children. In addition to these there are 84 national and parochial schools, 8 Roman Catholic schools, and 6 Wesleyan schools. The educational institutions of a higher order in the town are numerous and important. Of these the principal is the Yorkshire College, established in 1875 for the purpose of supplying instruction in the arts and sciences which are applicable to the manufactures, engineering, mining, and agriculture of the country. It has a staff of 19 professors, instructors, and assistant lecturers, and upwards of 350 day and 160 evening students. The college, which has carried on its operations hitherto in temporary premises, will shortly remove to permanent buildings designed by Mr Waterhouse, A.R.A. These buildings, which when completed will cost upwards of £100,000, will occupy a site of about 8½ acres, and will comprise extensive laboratories and workshops, large lecture theatres, and a college library and museum. The Leeds Public Library, established under the Public Libraries Act, now takes the first place amongst similar institutions in the borough. The reference library contained 26,000 volumes at the close of 1881, and the lending libraries 83,000 volumes, the expenditure for the year being £4160. The issue of volumes during the year reached the large total of 689,618. The Leeds Old Library, a private institution, founded in 1763 by Dr Friesen, who was at that time minister at the Unitarian chapel in the town, contains a very valuable selection of books, numbering about 75,000 volumes, and is in possession of commodious premises in Commercial Street. The Philosophical and Literary Society, established in 1826, possesses a handsome building in Park Row, containing a laboratory, a lecture room, and a museum, with many fine specimens in natural history, geology, and archaeology. The society also possesses a library of upwards of 16,000 volumes, chiefly rare scientific works. During the winter months, lectures on scientific and literary subjects are given in the lecture hall by men of eminence. The Leeds Mechanics' Institute in Cookridge Street is a striking building in the Italian style. It comprises a large circular lecture room, with gallery, capable of seating 1500 persons, besides a library, reading committee, and class rooms. The foundation stone was laid in 1836, and the total cost of the building has been nearly £30,000. Day and evening classes and an art school are carried on within the building, and are largely frequented. The Young Men's Christian Association, another educational institute of importance, occupies the building in South Parade formerly used as a mechanics' institute. The Grammar School, a handsome building, erected at Woodhouse Moor, has endowments producing over £3000 yearly. There are six exhibitions of £50 a year, each tenable for four years at Oxford, Cambridge, and Durham. It provides education for about 280 scholars. There is also a large training college for students proposing to enter the Wesleyan Methodist ministry at Headingley, one of the suburbs of Leeds. The principal charitable institution of the town is the general infirmary in Great George Street, a fine building, built of brick, with stone dressings, from designs by Sir Gilbert Scott. It is arranged upon the pavilion system, each ward being isolated from the rest of the building, and has a highly ornamental exterior, whilst the internal accommodation is suited to the requirements of the patients and the medical staff. The total cost of the erection was more than £100,000. The house of recovery for fever patients, founded in 1802, now occupies a handsome building at Burmantoft. There are also a large building used as a public dispensary in North Street, an institution for the blind, deaf, and dumb in Woodhouse Lane, a School of Medicine and other hospitals and charitable institutions.

The town and borough of Leeds was incorporated by letters patent, 2 Charles I., but this charter was cancelled or surrendered. A new charter was granted, 18 Charles II., under the style of mayor, aldermen, and burgesses of the borough of Leeds. The corporation consisted of a mayor, 12 aldermen, 24 assistants, and a staff of 18 officials. The Municipal Act of 1861 gave a corporation of 16 aldermen and 48 councillors, which has effected great improvements in the management of local matters. In addition to the powers granted to it by the Municipal Reform Act, the town council has secured, through successive Improvement Acts.

complete control over the paving and construction of the streets within the borough, as well as considerable powers for enforcing the consumption of smoke. It has also acquired the whole of the water supply of Leeds, and it controls the public markets, the lighting and watching of the streets, the execution of the Public Health Acts, &c. The supply of water for Leeds is now derived from the valley of the Wharfe, one of the tributaries of the Wharfe, where very extensive reservoirs have been provided, at a cost of £1,400,000. The gas supply of the town is also in the hands of the corporation, which purchased the whole of the gas works from the two companies then in existence in 1879, at the cost of nearly £1,000,000. The entire suite of markets, comprising the corn exchange, the Smithfield cattle market, and the produce markets, have been acquired at different periods, and the corporation has expended upon this property £240,000. The taxable value of the municipal borough is £1,152,000, and the income of the borough derived from the borough rate £28,106. The debt of the town amounted in 1881 to £3,884,000. Of the places of recreation in Leeds, the principal is the Grand Theatre, a handsome building erected from the design of Mr. Conson, in Upper Briggate, in 1879. Large assembly-rooms adjoin this theatre. There is another theatre in King Charles Croft, and there are one or two music halls. Some years ago the corporation acquired, at a large expenditure, Roundhay Park, an estate of great beauty in the neighbourhood of the town. After a portion of the ground had been laid out as building sites, the central part of the estate, comprising splendid lawns, woods of great extent, and a lake covering 40 acres, were reserved as a place of public recreation, and the park is now a favorite resort of the people of Leeds, and also of the inhabitants of the surrounding country. It is under the management of a committee of the corporation, and, though situated at an inconvenient distance from the centre of the town, is largely frequented during the summer months. Woodhouse Moor, a common occupying an elevated position north-west of the town, has been planted with trees and provided with walks within the last ten years, and in other parts of the town the corporation have laid out places of land, which had long been left bare and neglected.

The external appearance of the town has been greatly improved within the last twenty years. The event which had the greatest influence in promoting the erection of more handsome buildings than those of which Leeds was formerly constituted was the opening of the town-hall by the Queen in the year 1853. This is a noble building in the Grecian style. It is 250 feet long and 200 broad, and is crowned by a tower 225 feet high. The principal apartment in it is the Victoria Hall, a richly ornamented chamber 161 feet long, 72 feet wide, and 76 feet high. The building, which cost, including the site and furniture, more than £150,000, is adorned with statues and portraits of local celebrities. The municipal offices, including school board offices and buildings for the public library, are now in course of erection in the immediate neighbourhood of the town-hall, and will cost when completely upwards of £100,000. The other public buildings of importance in the town are the royal exchange, in Penpendicular Gothic, the foundation of which was laid in 1872, the corn exchange, a fine oval edifice, and the bank of Messrs Beckett & Co., one of the best works of Sir Gilbert Scott.

Leeds has long been distinguished for the activity of its political and public life. It has taken a leading part in many of the great questions which have agitated the country during the present century, and among its successive representatives in parliament have been Lord Macaulay, Sir William Molesworth, Mr. Marshall, those members of the Baines family, and other men whose names are familiar in the annals of the liberty party, to which upon the whole the borough has given a consistent support since its enfranchisement in 1832. The newspapers published in the town are the *Leeds Mercury*, daily, Liberal, established in 1718; the *Yorkshire Post and Leeds Intelligencer*, daily, Conservative, established in 1754; the *Leeds Express*, evening paper, Liberal, established in 1840; the *Leeds Conservative*; and the *Leeds Times*, weekly, Liberal. The *Leeds Mercury* for eighty years has been the property of Messrs Edward Baines & Sons, and has long been considered one of the most influential of provincial journals.

The area of the municipal and parliamentary borough is 21,572 acres. In addition to the township of Leeds come out-townships are included in this area. The population (207,105 in 1861 and 269,212 in 1871) in 1881 was 308,126, the number of inhabited houses being 65,084. Leeds is one of the boroughs which under the Reform Act of 1867 elect three members of parliament.

The name of Leeds has been attributed to a chief named Leod. Traces of Roman workmanship have at various times been discovered in the town, and in the parish church several very interesting Anglo-Saxon crosses, discovered when the church was rebuilt in 1588, are preserved. The castle of Leeds occupied a site on Mill Hill, and is supposed to have been built by Albert de Laci at the time of the Conquest, but no traces of it remain.

For the history of Leeds see Ralph Thoresby, *Duettius Ledoniensis*, 1716, 2d ed., 1816, with notes and additions by T. D. Whitaker,

who published the same year a companion volume *Leodis and Elmetis*; Parsons, *History of Leeds, Bradford, and Wakefield*, 1840; Wardell, *The Antiquities of the Borough of Leeds*, 1853. (T. W. R.)

LEEK, the *Allium Porrum* of botanists, a plant which is now considered as a mere variety of *Allium Ampeloprasum* produced by cultivation. It was formerly regarded as being a native of Switzerland, and the year 1582 has been set down as the date of its introduction to England. Both these assumptions are, however, erroneous. The plant is probably of Eastern origin, since it was commonly cultivated in Egypt in the time of the Pharaohs, and is so to the present day; while as regards its first appearance in England both Tusser and Gerard—two of our earliest writers on this class of subjects, the former of whom flourished in the early part and the latter in the later part of the 16th century—speak of it as being then commonly cultivated and used.¹ The Romans, it would appear, made great use of the leek for savouring their dishes, as seems proved by the number of recipes for its use referred to by Celsus. Hence it is more than probable that it was brought to England by the Romans during the period of their occupation. Italy was celebrated for leeks in the time of Pliny (*Z. N.*, xix. c. 8), according to whom they were brought into great notice and esteem through the emperor Nero, derisively surnamed "Porrophagus," who used to eat them for several days in every month to clear his voice. The leek is very generally cultivated in Great Britain as an esculent, but more especially in Scotland and in Wales, being esteemed as an excellent and wholesome vegetable, with properties very similar to those of the onion, but of a milder character. In America it is not much cultivated except by market gardeners in the neighbourhood of large cities. The whole plant, with the exception of the fibrous roots, is used in soups and stews. The sheathing stalks of the leaves lay over each other, and form a thickish stem-like base, which is blanched, and is the part chiefly preferred. These blanched stems are much employed in French cookery. They form an important ingredient in Scotch winter broths, and particularly in the national dish called *cullen-cakes*, and are also largely used boiled, and served with toasted bread and white sauce, as in the case of asparagus. Leeks are sown in the spring, earlier or later according to the soil and the season, and are planted out for the summer, being dropped into holes which are made with a stout dibble and left unfilled in order to allow the stems space to swell. When they are thus planted deeply the holes gradually fill up, and the base of the stem becomes blanched and prepared for use, a process aided by drawing up the earth round about the stems as they elongate. The leek is one of the most useful vegetables the cottager can grow, as it will supply him with a large amount of produce at a season when it will prove very welcome, namely, during the winter and spring. It is extremely hardy, and presents no difficulty in its cultivation, the chief point, as with all succulent esculents, being that it should be grown quickly upon well-enriched soil. The plant is of biennial duration, flowering the second year, and perishing after perfecting its seeds. The leek is the national symbol or badge of the Welsh, who wear it in their hats on St David's Day. The origin of this custom has received various explanations, all of which are probably more or less speculative.

LEEK, a market-town of Staffordshire, England, is situated on a fine eminence above the river Churnet, and on the Churnet Valley branch of the North Staffordshire Railway, 24 miles east-north-east of Stafford. Its streets

¹ Tusser, in his verse for the month of March, writes—

"Now leekes as in a season, for pottage ful good,
And speereth the milke cow, and purreth the blood,
Thene hawking with pession, for pottage in Lent,
Thene speereth both omelet and bread to be spent."

are wide and regular, and its sanitary and water arrangements are very complete. The church, dedicated to Saint Edward the Confessor, is in the Early English style. Much of the old building, erected in 1180, remains, but it has been frequently repaired, and in 1867 and 1875 underwent extensive restoration. In the vicinity of the town are the ruins of the Cistercian abbey De la Croix (known as Dislucra), erected in 1214 by Raoul de Blondeville, sixth earl of Chester. The grammar school was built in the beginning of last century by the earl of Macclesfield. The other principal buildings are the memorial cottage hospital for the county of Stafford, erected in 1870 from a private bequest, and the new town and market hall erected on the site of the old building. There is an important silk manufacture, and also agricultural implement works. The population of the urban sanitary district in 1881 was 12,865.

British and Roman remains have been found in the vicinity of Leek at various periods, and the town itself is of very great antiquity. Not some centuries after the Conquest it was the property of the earls of Chester, but afterwards it was bestowed on the monks of the abbey De la Croix. It received a market from King John On the 31st of December 1246 it was entered by the troops of the Pretender, and again on the 7th of the same month.

LEER, a seaport and the chief town of a circle in the province of Hanover, Prussia, lies on the right bank of the Leda near its confluence with the Ems, 16½ miles south of Aunch in 53° 13' N. lat. and 7° 27' E. long. The aspect of the town is generally pleasing, the streets being broad, well-paved, and adorned with many elegant buildings, among which are Roman Catholic, Lutheran, and Calvinist churches, and several public schools. The principal manufactures are for linen and woollen fabrics, hosiery, paper, cigars, soap, vinegar, and earthenware. There are, moreover, two iron-foundries, several distilleries, tanneries, and shipbuilding yards, besides many large warehouses. The transit trade from the regions traversed by the Westphalian and Oldenburg railways is considerable. The principal exports are cattle, horses, cheese, butter, honey, wax, flour, paper, hardware, and Westphalian coal. Vessels drawing 16 feet of water can approach the quays. The population in 1880 was 10,074.

LEEUWARDEN, or LEUWARDEN (in Frisian *Leeuward*, and Latinized as *Leovardus*), a town of Holland, at the head of the province of Friesland, 17 miles inland from Harlingen and 32 west of Groningen. It is one of the most prosperous of the secondary towns in the country, and, thanks in great measure to the opening of the railway to Harlingen (1868) and Groningen (1866), full of life and enterprise. To the name of the Frisian Hague it is entitled as well by similarity of history as by similarity of appearance. As the Hague grew up round the court of the counts of Holland, so Leeuwarden round the court of the Frisian stadtholders; and, like the Hague, it is an exceptionally clean, tasteful, and attractive town, with parks, pleasure grounds, and drives. The old gates have been somewhat ruthlessly cleared away, and the site of the town walls on the north and west competes with the Prince's Garden as a public pleasure ground. Besides the town-house (dating from 1715, and interesting mainly for the value of the archives admirably arranged by the Dutch antiquarian Eekhoff), the Prince Frederick barracks, capable of containing one thousand men, the corn exchange, and the beautiful weighhouse (dating from 1546), Leeuwarden contains a royal palace, originally the residence of the Frisian stadtholders, the provincial courts, erected in 1850; the so-called chancery (*Kanselarij*), a fine red brick mansion built in 1803 for the chancellor of Dukes George of Saxony, and now used as a house of detention; the penitentiary, rebuilt since 1870, and the largest establishment of the kind in Holland; and, somewhat oddly,

the communal buildings of the neighbouring commune of Leeuwardendam. The church of the Jacobins deserves mention as perhaps the largest monastic church in the country, and as the burial-place of the Frisian stadtholders (Louis of Nassau, Anne of Orange, &c.), whose splendid tombs, however, were destroyed in the revolution of 1795. Unlike the Hague, Leeuwarden is by nature and tradition the centre of an extensive and flourishing trade (in grain, cattle, flax, chicory, &c.). Its present distance from the sea is made up for by abundant means of communication by road, railway, and canal. The canal to Dokkum opens up the rich clay districts of the province, the canal to Harlingen (dating from 1507) furnishes a channel for the trade with England, and other canals give access to the province of Groningen and the Zuyder Zee, and so to Amsterdam and the provinces of Holland. And, though the industrial development is far from keeping pace with the commercial, Leeuwarden possesses large timber and boat-building yards, iron-foundries, copper-works, and lead-works; manufactures sewing machines, sofas, organs, cardboard, oil, and tobacco; and enjoys a wide reputation for its gold and silver wares. The population of the town in 1869 was 24,862; that of the commune increased from 15,686 in 1714 to 27,003 in 1875 (5217 Roman Catholics, 1124 Jews).

Leeuwarden, or that part of it which was called *Nijelove*, appears as early as 1149, and received the rank of a town in 1190. At that time it had free command of the sea, but the entry of the Middlezee on which it stood had already silted up by about 1200. In 1398 we find the town bestowed by Duke Albert of Holland on Gerolt Cammingha, whose family residence is still one of the notable mansions of the place. During the 16th and 18th centuries it plays a considerable part in Frisian history. The year 1499 saw the meeting of a stronghold in the town, which caused Albert of Saxony to bring the country under, and which made Leeuwarden a place of military importance till it was destroyed in 1650. When in 1659 Utrecht was taken by the rank of an archiepiscopal, Leeuwarden was made a bishopric, but only one occupant of the see was actually consecrated before the Reformation got mastery of the town in 1660.

LEEUWENHOEK, or LEUWENHOEK, ANTHONY VAN (1632-1723), a microscopist of remarkable scientific ability, was born at Delft, in Holland, in 1632. He does not seem to have had the advantage of a liberal education, but was probably brought up as a glass-grinder, early acquiring a reputation for the excellent lenses with which he furnished the microscopists who were then turning their attention to the minute structure of organized bodies. He appears soon to have found that simple lenses of very short focus were preferable for this purpose to the compound microscopes then in use; and it is clear from the discoveries he made with these that they must have been of very excellent quality.¹ These discoveries were for the most part originally given to the world in the *Philosophical Transactions* of the Royal Society, to the notice of which learned body he was first introduced by De Graaf in 1673. He was elected a fellow in 1680, and was chosen in 1697 a corresponding member of the Academy of Sciences in Paris. He died at his native place in 1723; and Sir Martin Folkes, then vice-president of the Royal Society, says in the eulogium he pronounced:—"We have seen so many and those of his most surprising discoveries, so perfectly confirmed by great numbers of the most curious and

¹ It is much to be regretted that a cabinet which he bequeathed to the Royal Society of London, containing twenty-six of these single microscopes, each mounted with a suitable object, and accompanied by a magnified drawing of it, the whole being the work of his own hands,—is no longer in its possession. Baker, in his *Treatise on the Microscope*, affirms, from personal and careful examination, that (contrary to the statements of some writers who represented Leeuwenhoek as having worked with globules of glass) "every one of the twenty-six microscopes is a double-convex lens, and not a sphere or globule"; and he states that their magnifying powers range from 40 to 180 diameters.

judicious observers, that there can surely be no reason to distrust his accuracy in those others which have not yet been so frequently or so carefully examined."

His capital discovery was undoubtedly that of the capillary circulation of the blood, first announced in 1690, which afforded the link still wanting for the completion of the doctrine of Harvey, by showing that the blood passes from the arteries into the veins through a network of extremely minute vessels, the tissue of which allow the fluid plasma to transude into the vessels it traverses, so as to serve for their nutrition. He first sought to discern this in the comb of a young cock, then in the ear of a white rabbit, and then in the membrane of a bat's wing; but, though in the last he was able to follow an artery to its ultimate subdivision, he found that, as soon as "it became so small as only to admit one or two globules to pass through it at a time, he then lost sight of it," partly in consequence of "the membrane of the wing being covered with a kind of scale" (epidermis). His first success was obtained with the tail of a newly-hatched tadpole, in which, he says, "I could distinctly perceive the whole circuit of the blood, in its passage to the extremities of the vessels, and in its return towards the heart"—its movement being made apparent by that of the globules carried along in its current. These corpuscles, which had been previously discovered by Malpighi, were correctly described by Leeuwenhoek as flattened circular disks in man, and as oval disks in tadpoles. He afterwards observed the capillary circulation in the tail-fins of small fishes, and recognized the ellipticity of the corpuscles in that class also. He even made out the capillary circulation in the broad thin extremities of the two smallest or hind feet of small crabs about an inch in diameter, and correctly remarked that the corpuscles of their blood were colourless and far fewer than those of fishes or tadpoles, "the globules in red blood being (I am well assured) twenty-five times more in number than those, in the same space, in the blood of a crab." To us it seems not a little surprising that his assertions in regard to the capillary circulation were deemed incredible by some of his scientific contemporaries. It is recorded, however, that Peter the Great, when passing through Delft in 1698, requested Leeuwenhoek to pay him a visit, and to bring his microscope with him, and that the czar was particularly impressed by the spectacle of the circulation in the tail of a small eel.

Among Leeuwenhoek's discoveries in the minute anatomy of man and the higher animals may be specially mentioned the tubules of teeth, the fibrous structure of the crystalline lens, the solidity of the human hair (which had been previously represented as tubular), the structure of the epidermis, and the parallel tubules of the medullary substance of the brain,—which last, however, he supposed to be vessels conveying fluid substance from the highly vascular cortical layers, for the support and nourishment of the spinal marrow and nerves. He was also an independent discoverer of the spermatozoa, although anticipated by a few months by Ludwig Hamn, a student at Leyden.

As might be expected, he made many observations on the anatomy of insects; and among the most interesting of these are his discovery of the composite structure of the eyes (which he recognized also in the eyes of the shrimp), the scales on the wings not only of moths but of the gnat, and the annular (really spiral) structure in the walls of the "vessels" (*tracheæ*) of their wings. He also proved that cochineal, which had been supposed to be "the fruit of some tree," is really the dried body of an insect, which he not unnaturally supposed to be allied to the ladybird. He likewise gave a very good account of the spinnerets and poison-claws of spiders, and of the comb-like

appendages to their feet. He made a special study, also, of the anatomy of the flea,—besides following out its reproduction with great care, as will presently appear.

In examining the stomachs of shrimps, he found in them some minute shells, of which he figured a specimen so exactly that it can be at once recognized as a *Monitina*,—probably the first recent foraminifer that had been distinctly noticed. But one of his most interesting observations is that which he made upon a small *Balanus* attached to a mussel-shell; for he not only gives a good figure of the animal, but describes the way in which it retorts into its shell, and closes its orifice by two shelly valves. His figure most distinctly shows its *articulate* character, which has only in modern times caused its removal from the molluscae to the annulose sub-kingdom.

Not less admirable were his observations on the structure of plants. He made very careful sections of stems of the oak, elm, beech, willow, fir, and other trees, in different directions, of which he gave careful figures and descriptions,—especially noting the horizontal arrangement of the cells in the "medullary rays," and the peculiar "pitting" of the woody fibre of the fir, as well as the absence of large vessels in the latter. He also examined the structure of various germinating seeds, and gave accurate descriptions of the relation of the embryo to the cotyledons.

Although, when he ventured into physiological speculation, Leeuwenhoek's ideas (like those of the best physiologists of his time) were often very crude, his reasonings upon the facts actually observed by him are often remarkably cogent and sagacious. Thus, to estimate the insensible perspiration, he placed his hand within a dry glass jar, closed the space between its neck and his wrist by stuffing his handkerchief into it, and carefully collected and weighed the moisture which accumulated in its interior during a given time, and by a computation based on the ratio of the surface of the hand to that of the entire body he concluded that about 28 oz. of fluid are daily lost by transpiration, which is not far from the truth. So, again, he triumphantly refuted the chemical theories which then reigned in medicine, and which assumed that the blood undergoes a fermentation like that of wine or beer, by the statement that he had never seen in the blood-vessels the bubbles of gas which must be generated in them if this doctrine were correct. In one important point, however, he allowed his imagination to supplement the necessary imperfection of his observations, maintaining that each blood-disk is made up of six coherent particles, an idea probably suggested by the crenated appearance which the blood-disks often present.

It is to Leeuwenhoek that we owe the refutation of the then current heliogenic doctrine that animals of high organization can be "produced spontaneously, or bred from corruption." This doctrine had been previously attacked by Redi, who showed that the putrefaction of meat will not engender maggots, if the access of blow-flies be prevented. But even Redi, while upholding the doctrine "*Omne vivum ex vivo*," believed that the insects found within the galls of plants, and the parasitic worms by which the human body is sometimes infested, are generated by a peculiar modification of the living vegetable or animal substance. It was Leeuwenhoek who first explicitly took up the position that every living organism reproduces its like, no type originating in any other way than by the ordinary generation of its kind; "*Omne vivum ex ovo*." Thus he established by careful and prolonged observation, in a great variety of cases in which "spontaneous generation" had been reputed to take place, and he further continually adduced the great complexity of organization which his microscopic researches had revealed in what had been previously regarded as creatures of the lowest grade, as an argument against the doctrine that they are "bred from corruption." Thus he followed out the whole history of oak-galls, and showed that they are a product of a peculiar vegetable growth, excited by the insertion of an egg by the winged insect, and supplying the maggot, when hatched, with food. So, again, he showed that the warts of granaries, then commonly supposed to be bred from wheat, as well as in it, are nothing else than grubs hatched from eggs deposited by winged insects; and he practically applied this conclusion, by recommending that granaries thus infested should be repeatedly fumigated with sulphur at the time when these insects come forth, so as to kill them before they deposit eggs. His chapter on the flea, in which he not only describes its structure, but traces out the whole history of its metamorphoses from its first emergence from the egg, is full of interest,—not so much for the exactness of his observations, as for the evidence of revelation of the extraordinary ignorance then prevalent in regard to the

origin and propagation of "this minute and despicable creature," which some asserted to be produced from sand, others from dust, others from the dung of pugs, and others from urine, but which he showed to be "endowed with as great perfection in its kind as any large animal," and proved to breed in the regular way of winged insects. He often noted the fact that the pupa of the flea is sometimes attached and fed upon by a mite,—an observation which suggested the well-known lines of Swift.

Although Bonnet is usually credited with the discovery of the viviparous propagation of the *Aphides*, this had been really made by Leeuwenhoek half a century previously. For, his attention having been drawn to the lighting of the young shoots of fruit-trees, which was commonly attributed to the ants found upon them, he was the first to find the *Aphides* that really do the mischief, and, upon searching, after his wont, into the history of their generation, he observed the young within the bodies of their parents. He carefully studied also the history of the wit, and was the first to show that what had been commonly reputed to be "ant eggs" are really their pupae, containing the perfect insect nearly ready for emission, whilst the true eggs are far smaller, and give origin to "maggots" or larvae.

Of the sea-mussel, again, and other shell-fish, he argued (in reply to a then recent defence of Aristotle's doctrine by Bonnet, a learned Jesuit of Italy) that they are not generated out of the mud or sand which is found on the sea-shore or the beds of rivers at low water, but from spawn, by the regular course of generation. "For my part," he says, "I hold it equally impossible for a small shell fish to be produced without generation as for a whale to have its origin in the mud." And he maintained the same to be true of the fresh-water mussel (*Unio*), whose ova he examined so carefully that he saw in them the rotation of the embryo, a phenomenon supposed to have been first discovered long afterwards. "This uncommonly pleasing spectacle," he says, "is enjoyed by myself, my daughter, and the engraver for three whole hours, and we thought it one of the most delightful that could be exhibited." Not only was he the first discoverer of the rotifers, but he showed "how wonderfully nature has provided for the preservation of their species," by their tolerance of the drying-up of the water they inhabit, and the resistance afforded to the rupture of the fluid which their bodies by the impermeability of the casing in which they then become enclosed. "We can now easily conceive," he says, "that in all rain-water which is collected from gutters in cities, and in all waters exposed to the air, animalcules may be found, for they may be carried thither by the particles of dirt blown about by the winds." Although Hakea is usually credited with the first careful study of the "wheel-animalcule," yet he really added very little to the account long previously given of it by Leeuwenhoek. In the same spirit he investigated the generation of sels, which were at that time exposed, not only by the ignorant vulgar, but by "respectable and learned men," to be produced from dew (!) without the ordinary process of generation. He was rewarded by the discovery of their viviparous propagation,—his careful and prolonged observations on which point, though since called in question, have never been refuted. The spectacle of the minute sels lying together in a transparent liquid within the body of the female gave him, he says, great pleasure,—affording a complete answer to those who said, behind his back, "Since Mr. Leeuwenhoek is endeavouring to establish the regular generation of all animals, let him show us in what manner sels are bred."

Altogether it does not seem too much to affirm that Leeuwenhoek is well entitled to be considered, not only as "the father of scientific microscopy," but as having contributed more than any other naturalist to the overthrow of the doctrine of "spontaneous generation," and as having set a most admirable example of scientific method in the prosecution of biological research.

Leeuwenhoek's contributions to the *Philosophical Transactions* amounted to one hundred and twelve. He also published twenty-six papers in the *Memoirs of the Paris Academy of Sciences*. Two collections of his works appeared during his life, one in Dutch, and the other in Latin; the most complete edition having been published at Leyden shortly before his death in 4 vols. (1719-22). A selection from this, translated into English by S. Hoole, was published in London (1798-81), 2 vols. 4to. (W. B. G.)

LEFFREY D'ETAPLES. See FABRE, JACQUES.

LEGATE, one of the special names of a messenger or ambassador of the pope. The first four centuries present us with no actual recorded instances of recognized delegation of the papal authority; for that Hosius acted as papal legate at the council of Nice is nothing more than an

assertion of Gelasius of Cyzicus, who wrote about the end of the 5th century, and no Western prelate took any part, either personally or otherwise, in the first council of Constantinople. The fifth (sometimes called the seventh) canon of the council of Sardica, in 343, however, shows that the possibility of such delegation had already begun to be discussed, and suggests that it may actually have been exemplified before that date. This canon provides that, in case of an appeal by a deposed bishop to Rome, if the pope is inclined to grant a new trial, it shall be competent for him to write to the bishops of the neighbouring province, but if the appellant wishes the pope to send priests from his own side ("ut de latere suo presbyteros mittat"), it shall be free to the pope to do so, and give them due rank and dignity in the court thus constituted (Hefele, *Conc.*, i. 568). Instances of delegation of the papal authority in various degrees become numerous in the course of the 5th century, especially during the pontificate of Leo I. Thus Leo writes in 444 (Ep. 6) to Anastasius of Thessalonica, appointing him his vicar for the province of Illyria; the same arrangement, he informs us, had been made by Pope Siricius in favour of Anysius, the predecessor of Anastasius. Similar vicarial or legatine powers had been conferred in 418 by Zosimus upon Patroclus, bishop of Arles. In 449 Leo was represented at the "Robber Synod" from which his legates hardly escaped with life; at Chalcedon in 451, they were treated with singular honour. Again, in 453 the same pope writes to the empress Pulcheria, naming Julianus of Coe as his representative in the defence of the interests of orthodoxy and ecclesiastical discipline at Constantinople (Ep. 112); the instructions to Julianus are given in Ep. 113 ("hanc specialem curam vices meae functionis assumas"). The designation of Anastasius as vicar apostolic over Illyria may be said to mark the beginning of the custom of conferring, *ex officio*, the title of *legatus* upon the holders of important sees, who ultimately came to be known as *legati nati*, with the rank of primate, the appointment of Julianus at Constantinople gradually developed into the long permanent office of *apocrisarius* or *respondens*. Another sort of delegation is exemplified in Leo's letter to the African bishops (Ep. 12), in which he sends Potentius, with instructions to inquire in his name, and to report (*vicem curae nostrae fratri et consacerdoti nostro Potentio delegantes qui de episcopis, quorum culpabilis ferebatur electio, quid veritas haberet inquireret, nobiscum omnia fideliter indicaret*). Passing on to the time of Gregory the Great, we find Augustine of Canterbury sometimes spoken of as *legatus*, but it does not appear that in his case this title was used in any strictly technical sense, although the archbishop of Canterbury afterwards attained the permanent dignity of a *legatus natus*. Boniface, the apostle of Germany, was in like manner constituted, according to Hincmar (Ep. 30), a *legatus* of the apostolic see by Popes Gregory II. and Gregory III. According to Hefele (*Conc.*, iv. 239), Rodolph of Porto and Zacharias of Anagni, who were sent by Pope Nicolas to Constantinople in 860, were the first who are actually called *legati a latere*. The policy of Gregory VII. naturally led to a great development of the legatine as distinguished from the ordinary episcopal function. According to the *Nova Compilatio Decretalium* of Gregory IX., under the title "De officio legati" the canon law recognizes two sorts of legats, the *legatus natus* and the *legatus datus* or *missus*. The *legatus datus* (*missus*) may be either (1) *delegatus*, or (2) *nuncios apostolicus*, or (3) *legatus a latere* (*lateralis, collateralis*). The rights of the *legatus natus*, which included concurrent jurisdiction with that of all the bishops within his province, have been much curtailed since the 16th century; they were altogether suspended in presence of the higher claims of a *legatus a*

¹ Leeuwenhoek's argument in this instance was partly based on false premises. For he imagined the *Legyris* with which mussel-shells are often encrusted to be the eggs of the mussel, and the centipeded *Polysma*, whose sixteen tentacles he figures, to be the young mussel.

latere, and the title is now almost quite honorary. It still attaches to the sees of Seville, Toledo, Arles, Rheims, Lyons, Gran, Prague, Gnesen-Posen, Cologne, Salzburg, among others. The commission of the *legatus delegatus* (generally a member of the local clergy) is of a limited nature, and relates only to some definite piece of work. The *nuncios apostolici* (who has the privilege of red apparel, a white horse, and golden spurs) possesses ordinary jurisdiction within the province to which he has been sent, but his powers otherwise are restricted by the terms of his mandate. The *legatus a latere* (almost invariably a cardinal, though the power can be conferred on other prelates) is in the fullest sense the plenipotentiary representative of the pope, and possesses the high prerogative implied in the words of Gregory VII., "*nostra vice quae corrigenda sunt corrigit, quae statuenda, constituit*." He has the power of suspending all the bishops in his province, and no judicial cases are reserved from his judgment. Without special mandate, however, he cannot depose bishops or unite or separate bishoprics. At present *legati a latere* are not sent by the holy see, but diplomatic relations, where they exist, are maintained by means of nuncios, internuncios, and other agents. According to the congress of Vienna, the diplomatic rank of a papal nuncio corresponds to that of an ambassador. The pope at present has nuncios at the courts of Bavaria, Austria-Hungary, Belgium, Chili, Spain, France, and Portugal. Inferior in rank and less numerous are the internuncios (Holland, Brazil).

LEGENDRE, ADRIEN MARIE (1752-1833), French mathematician, a contemporary of Laplace and Lagrange, with whom he deserves to be ranked,¹ was born at Paris (or, according to some accounts, at Toulouse) in 1752. He was brought up at Paris, where he completed his studies at the Collège Mazarin. His first published writings consist of some articles forming part of the *Traité de Mécanique* (1774) of the Abbé Marie, who was his professor. Legendre's name, however, is not mentioned. Soon afterwards he was appointed professor of mathematics in the École Militaire at Paris, and he was afterwards professor in the École Normale. In 1782 he received the prize from the Berlin Academy for his "Dissertation sur la question de balistique," a memoir relating to the paths of projectiles in resisting media. He also, about this time, wrote his "*Recherches sur la figure des planètes*," published in the *Mémoires* of the French Academy, of which he was elected a member in succession to D'Alembert in 1783. He was also appointed a commissioner for connecting geodetically Paris and Greenwich, his colleagues being Méchain and Cassini; General Roy conducted the operations on behalf of England. The French observations were published in 1792 (*Exposé des opérations faites en France en 1787 pour la jonction des observations de Paris et de Greenwich*). During the Revolution, when the decimal system had been decreed, he was one of the three members of the council established to introduce the new system, and he was also a member of the commission appointed to determine the length of the metre, for which purpose the calculations, &c., connected with the arc of the meridian from Barcelona to Dunkirk were revised. He was also associated with Prony in the formation of the great French table of logarithms of numbers, sines, and tangents, and natural sines, called the *Tables du Cadastre*, in which the quadrant was divided centesimally; these tables have never been published (see LOGARITHMS). He also served on other public commissions. He was examiner in the École Polytechnique, but held few important state offices, and he

seems never to have been much noticed by the different Governments; it has indeed been generally remarked that the offices he held were not such as his reputation entitled him to. Not many facts with regard to his personal life seem to have been published, but in a letter to Jacobi of June 30, 1833, he writes—"Je me suis marié à la suite d'une révolution sanglante qui avait détruit ma petite fortune; nous avons eu de grands embarras et des moments bien difficiles à passer, mais ma femme m'a aidé puissamment à restaurer progressivement mes affaires et à me donner cette tranquillité d'esprit nécessaire pour me livrer à mes travaux accoutumés et pour composer de nouveaux ouvrages qui ont ajouté de plus en plus à ma réputation, de manière à me procurer bientôt une existence honorable et une petite fortune dont les débris, après de nouvelles révolutions qui m'ont causé de grandes pertes, suffisent encore pour pourvoir aux besoins de ma vieillesse, et suffiront pour pourvoir à ceux de ma femme bien-aimée quand je n'y serai plus."

He died at Paris on January 10, 1833, in his eighty-first year, and the discourse at his grave was pronounced by Poisson. He was engaged in mathematical investigations almost up to the time of his death. The last of the three supplements to his *Traité des Fonctions Elliptiques* was published in 1832, and Poisson in his funeral oration remarked—"M. Legendre a eu cela de commun avec la plupart des géomètres qui l'ont précédé, que ses travaux n'ont fini qu'avec sa vie. Le dernier volume de nos *Mémoires* renferme encore un mémoire de lui, sur une question difficile de la théorie des nombres; et peu de temps avant la maladie qui l'a conduit au tombeau, il se procura les observations les plus récentes des comètes à courtes périodes, dont il allait se servir pour appliquer et perfectionner ses méthodes."

Legendre was the author of separate works on elliptic functions, the integral calculus, the theory of numbers, and the elements of geometry, besides numerous papers which were published chiefly in the *Mémoires* of the French Academy; and it will be convenient, in giving an account of his writings, to consider them under the different subjects which are especially associated with his name.

Elliptic Functions.—This is the subject with which Legendre's name will always be most closely connected, and his researches upon it extend over a period of more than forty years. His first published writings upon the subject consist of two papers in the *Mémoires* of the French Academy for 1786 upon elliptic arcs. In 1792 he presented to the Academy a memoir on elliptic transcendents. The contents of these memoirs are included in the first volume of his *Exercices de Calcul Intégral* (1811). The third volume (1816) contains the very elaborate and now well-known tables of the elliptic integrals which were calculated by Legendre himself, with an account of the mode of their construction. In 1827 appeared the *Théorie des fonctions elliptiques* (2 vols., the first dated 1825, the second 1826); a great part of the first volume agrees very closely with the contents of the *Exercices*, the tables, &c., are given in the second volume. Three supplements, relating to the researches of Abel and Jacobi, were published in 1828-32, and form a third volume. Legendre had pursued the subject which would now be called elliptic integrals alone from 1786 to 1827, the results of his labours having been almost entirely neglected by his contemporaries, but his work had scarcely appeared in 1827 when the discoveries which were independently made by the two young and as yet unknown mathematicians Abel and Jacobi placed the subject on a new basis, and revolutionized it completely. The readiness with which Legendre, who was then seventy-six years of age, welcomed these important researches, that quite overshadowed his own, and included them in successive supplements to his work, does the highest honour to him. The sudden occurrence, near the close of his long life, of these great discoveries relating to a subject which Legendre had so completely made his own and apparently exhausted, and their ready acceptance by him, form one of the most striking episodes in the history of mathematics. A very full account of the contents of Legendre's work and of the results obtained by Abel and Jacobi has been given in the article *INDEFINITE ANALYSIS*, vol. xii. pp. 62-72. (See also Louis KILLIE's report "On the Recent Progress of Analysis," in the *Report of the British Association for 1846* (pp. 44-9).

Berlinian Integrals and Integral Calculus.—The *Exercices de Calcul Intégral* consist of three volumes, a great portion of the first and the whole of the third being devoted to elliptic functions. The

¹ Besides Laplace and Lagrange, with whom it is most natural to associate Legendre, the names of Poisson, Cauchy, Fourier, and Monge should be mentioned as contemporaries. The number of French mathematicians of the highest rank who were living at the same time, at the beginning of the century, has often been the subject of remark.

remainder of the first volume relates to the Eulerian integrals and to quadratures. The second volume (1817) relates to the Eulerian integrals, and to various integrals and series, developments, mechanical problems, &c., connected with the integral calculus; this volume contains also a numerical table of the values of the gamma function. The latter part of the second volume of the *Œuvres des Fonctions Elliptiques* (1828) is also devoted to the Eulerian integrals, the table being reproduced. Legendre's researches connected with the gamma function are of importance, and are well known; the subject was also treated by Gauss in his memoir *Disquisitiones arithmeticae et de arithmetica* (1801), but in a very different manner. The results given in the second volume of the *Œuvres* are of too miscellaneous a character to admit of being briefly described. In 1788 Legendre published a memoir on double integrals, and in 1809 one on definite integrals.

Theory of Numbers.—Legendre's *Théorie des Nombres* and Gauss's *Disquisitiones Arithmeticae* (1801) are still the standard works upon this subject. The first edition of the former appeared in 1788 under the title *Essai sur la Théorie des Nombres*; there was a second edition in 1808; a first supplement was published in 1816, and a second in 1835. The third edition, under the title *Théorie des Nombres*, appeared in 1880 in two volumes. To Legendre is due the discovery known as the law of quadratic reciprocity, the most important general result in the science of numbers which has been discovered since the time of Fermat, and which was called by Gauss the "gem of arithmetic." It was first given by Legendre in the *Mémoires* of the Academy for 1786, but the demonstration that accompanied it was incomplete. The symbol $\left(\frac{a}{p}\right)$ which is known as Legendre's sym-

bol, and denotes the product on negative unit which is the remainder when a^{p-1} is divided by a prime number p , does not appear in this memoir, but was first used in the *Essai sur la Théorie des Nombres*. Legendre's formula $x(\log x - 1.08869)$ for the approximate number of forms inferior to a given number x was first given by him also in this work (3d ed., p. 394).

Attractions of Ellipsoids.—Legendre was the author of four important memoirs on this subject. In the first of these, entitled "Recherches sur l'attraction des sphéroïdes homogènes," published in the *Mémoires* of the Academy for 1786, but communicated to it at an earlier period, Legendre introduces the celebrated expressions which, though frequently used by Laplace, are more correctly named after Legendre. The definition of the coefficients is that if $(1 - 2h \cos \theta + h^2)^{-1}$ be expanded in ascending powers of h , and if the sum of the n th order term is denoted by P_n , then P_n is of the Legendrian coefficient of the n th order. In this memoir also the function which is now called the potential was, at the suggestion of Laplace, first introduced. Legendre also treated elliptic coefficients, with respect to confocal ellipsoids is true for any position of the external point when the ellipsoids are solids of revolution. Of this memoir Todhunter writes—"We may affirm that no single memoir in the history of our subject can rival this in interest and importance. During forty years the resources of analysis, even in the hands of D'Alembert, Lagrange, and Laplace, had not carried the theory of the attraction of ellipsoids beyond the point which the geometry of Maclaurin had reached. The introduction of the coefficients now called Laplace's, and their application, commences a new era in mathematical physics. Legendre's second memoir was communicated to the Academy in 1786, and relates to the conditions of equilibrium of a mass of rotating fluid in the form of a figure of revolution which does not deviate much from a sphere. The third memoir relates to Laplace's theorem respecting confocal ellipsoids. Of the fourth memoir Todhunter writes, "It occupies an important position in the history of our subject. The more striking solution which we here meet in previous researches consists in the treatment of a planet supposed entirely fluid; the general equation for the form of a stratum is given for the first time and discussed. For the first time we have a correct and convenient expression for Laplace's n th coefficient." See Todhunter's *History of the Mathematical Theories of Attraction* and the *Figure of the Earth* (1873), the twentieth, twenty-second, twenty-fourth, and twenty-fifth chapters of which contain a full and complete account of Legendre's four memoirs. For the theory of the Legendrian coefficients and the analysis connected with them, the reader is referred to Hesse's *Handbuch der Kugelfunctionen* (Berlin, 1876), to Trautmann's *Traité de Laplace's Fonctions, Lamé's Fonctions, et Bessel's Fonctions* (1876), or to Ferrers's *Spherical Harmonics* (1877). It should be mentioned that Legendre's coefficients have been recently termed zonal harmonics by some writers.

Geodesy.—Besides the work upon the geodesical operations connecting Paris and Greenwich referred to above, and of which Legendre was one of the authors, he published in the *Mémoires* of the Academy for 1787 two papers on trigonometrical operations depending upon the figure of the earth, concerning many theorems relating to this subject. The best known of these, which is called Legendre's theorem in treatises on spherical trigonometry, by means of it a small spherical triangle may be treated

as a plane triangle, certain corrections being applied to the angles. Legendre was also the author of a memoir upon triangles drawn upon a spheroid. Legendre's theorem is a fundamental one in geodesy, and his contributions to the subject are of the greatest importance.

Method of Least Squares.—In 1805 appeared Legendre's *Nouvelles Méthodes pour la détermination des courbes*, which is memorable as containing the first published suggestion of the method of least squares. In the preface Legendre remarks, "La méthode qui me parait la plus simple et la plus générale consiste à rendre minimum la somme des carrés des erreurs, . . . et que j'appelle méthode des moindres carrés"; and in an appendix in which the application of the method is explained his words are, "De tous les principes qu'on peut proposer pour cet objet, je pense qu'il n'est pas de plus général, de plus exact, ni d'une application plus facile que celui dont nous avons fait usage dans les recherches précédentes, et qui consiste à rendre minimum la somme des carrés des erreurs." The method was proposed by Legendre only as a convenient process for testing observations, without reference to the theory of probability. It had, however, been applied by Gauss as early as 1796, and the method was fully explained, and the law of facility for the first time given by him in 1805. Laplace also justified the method by means of the principles of the theory of probability, and thus led Legendre to republish the part of his *Nouvelles Méthodes* which related to it in the *Mémoires* of the Academy for 1810. Thus, although the method of least squares was first formally proposed by Legendre, the theory and algorithm and mathematical foundation of the process are due to Gauss and Laplace. Legendre published two supplements to his *Nouvelles Méthodes* in 1805 and 1820.

The Elements of Geometry.—Legendre's name is most widely known on account of his *Éléments de géométrie*, the most successful of the numerous attempts that have been made to supersede Euclid as a text-book on geometry. It first appeared in 1794, and went through very many editions, and has been translated into almost all languages. An English translation, by Sir David Brewster, from the eleventh French edition, was published in 1823, and is well known in England. The earlier editions did not contain the trigonometry. In one of the notes Legendre gives a proof of the rationality of π . This had been first proved by Lambert in the *Berlin Memoirs* for 1768. Legendre's proof is similar in principle to Lambert's, but much simpler. On account of the objections urged against the treatment of parallels in this work, Legendre was induced to publish in 1803 his *Nouvelle Théorie des parallèles*. His *Géométrie* gave rise in England also to a lengthened discussion on the difficult question of the treatment of the theory of parallels.

It will thus be seen that Legendre's works have placed him in the very foremost rank in the widely distinct subjects of elliptic functions, theory of numbers, attractions, and geodesy, and have given him a conspicuous position in connexion with the integral calculus and other branches of mathematics. He ranked high in the integration of partial differential equations and a few others which have not been noticed above, but they relate to subjects with which his name is not especially associated. A good account of the principal works of Legendre is given in the *Bibliothèque Universelle de Genève* for 1855, pp. 45-52. (J. W. L. G.)

LEGERDEMAIN, PRESTIDIGITATION, or SLEIGHT OF HAND, as it is variously called, is the art of deceiving the eye of the spectator by adroit movements of the hand of the operator so as apparently to cause an object either to be changed, produced, or made to disappear. The term "legerdemain" is extended in meaning to include all sorts of "conjuring" by means of mechanical and other contrivances, although it properly applies to tricks performed with the hand alone. Even in ancient times two distinct branches of magic existed—the impostures of divination and necromancy, and the amusing exhibition of jugglery and sleight of hand. Judging from the accounts which history has handed down to us, the marvels performed by the thaumaturgists of antiquity were very skillfully produced, and must have required a considerable practical knowledge of the art. The Romans were in the habit of giving conjuring exhibitions, the most favourite feat being that of the "cups and balls," the performers of which were called *actabularii*, and the cups themselves *actabula*. The balls used, however, instead of being the convenient light cork ones employed by modern conjurers, were simply round white pebbles which must have added greatly to the difficulty of performing the trick. The art survived the barbarism and ignorance of the Middle Ages; and the earliest professors of the modern school were Italians such as Jonas, Androletti, and Antonio Carlotti. In England

legerdemain has always found professors and patrons; Chaucer, in describing a motley assemblage, says:—

"There I saw playenge jougelaurs,
Magiciens, tregotours,
Pietonysse, charmeresses,
Olii wiches, sovercesses,"

and in another place (*House of Fame*, bk. iii.) he records a startling feat of prestidigitation:—

"There I saw Coll Tregetour
Upon a table of aycomour
Play an uncouth thyng to tell;
I saw him cary a wyndemell
Under a walnut shale."

But there is no reason for supposing that the ancient magicians were more proficient in the art than their modern successors, and, as Robert-Houdin, the greatest of modern conjurers, has pithily observed, "if antiquity was the cradle of magic, it is because the art was yet in its infancy." Towards the close of the reign of Elizabeth the profession had fallen very low in England, and the performers were classed with "ruffians, blasphemers, thieves, vagabonds, Jews, Turks, heretics, pagans, and sorcerers." In 1840 a German physicist named Dobler devised an entertainment which gave an entirely new development to the science, and was in effect the same as the conjuring entertainments which have since become so popular and familiar. The most eminent conjurers of the modern school have been Robert-Houdin, Wiljalba Frickell, Hermann, and Boatié de Kolta.

The secrets of legerdemain were for a long time jealously guarded by its professors, but in 1793 a work appeared in Paris entitled *Testament de Jérôme Sharpe, Professeur de Physique Amusante*, which gives a very fair account of the methods then in vogue. Its author was M. Decremps. In 1856 a still more important and accurate book was published—*Sorcellerie ancienne et moderne expliquée*, by J. N. Ponsin; and ten years later J. E. Robert-Houdin issued his *Secrets de la Prestidigitation et de la Magie*, which is a masterly exposition of the entire art and mystery of conjuring. The last-mentioned book has been translated into English by "Professor Hoffman," the author of *Modern Magic*, the best English treatise on the subject. Modern magic calls to its aid all the appliances of modern science,—electricity, magnetism, optics, and mechanics; but the most successful adepts in the art look down upon all such succedaneous aids and rely upon address and sleight of hand alone. Confederacy is never resorted to except by the merest tyros. The prestidigitator's motto is "The quickness of the hand deceives the eye"; but this very phrase, which is always in a performer's mouth, is in itself one of the innocent frauds which the conjuror employs as part and parcel of his exhibition. The truth is that it is not so much upon the quickness with which a feat is performed as upon the adroitness with which the time and means of performing it are concealed that its success depends. "A prestidigitator," says Robert-Houdin, "is not a juggler, he is an actor playing the part of a magician, an artist whose fingers should be more clever than nimble. I would even add that, in the practice of legerdemain, the calmer the movements are the more easy it is to produce an illusion on the spectators." Professor Hoffman corroborates this statement, and says, "The effects of magic are produced by successive adroit substitutions, and the whole magic of the trick consists in the concealment of the particular moment at which each substitution is effected." The right opportunity for executing the required movement is technically called a *temps*. This is defined to be any act or movement which distracts the attention of the audience while something is being "vanished" or "produced." Experiment will readily convince any one that it is absolutely impos-

sible to move the hand so quickly as to abstract or replace any object without being perceived, so long as the eyes of the audience are upon the performer. But it is very easy to do so unnoticed, provided the audience are looking another way at the time, and the faculty of thus diverting their attention is at once the most difficult and the most necessary accomplishment for a conjuror to acquire. It does not suffice to point, or ask them to look in another direction, because they will obviously suspect the truth and look with all the more persistence. The great requisite is to "have a good eye"—in French conjuring parlance *avoir de l'œil*, an earnest, convinced look of the performer in a particular direction will carry every one's glances with it, while a furtive glance at the hand which is performing some function that should be kept secret will run all

Robert-Houdin may be considered the actual founder of the modern school of legerdemain. This celebrated conjuror, who was originally a watchmaker and mechanician, possessed a remarkably inventive genius, and, having early turned his attention to legerdemain, he concentrated all his efforts upon the development and improvement of that art. Discarding the clumsy tricks of what he calls the "false-bottomed school," as well as the gaudy paraphernalia with which his predecessors used to encumber their stage, he produced in 1845, at a little theatre in the Palais Royal, a number of entirely new illusions, in which all the resources of mechanical and electrical science were combined with manual dexterity and personal address. His entertainments, which he called *Soirées Fantastiques*, made a great sensation in Paris, and placed him at once at the head of his profession. His skill and success were so great that the French Government sent him on a sort of roving commission to Algeria, in order that he might, by his exhibitions of natural magic, destroy the prestige of the *marabouts*—wonder-workers who had obtained a great and dangerous influence over the Arabs by their pretended miracles. The motto prefixed by Robert-Houdin to his chapter on the "Art of Conjuring" is—"to succeed as a conjuror, three things are essential: first, dexterity, second, dexterity, and third, dexterity"; and this is not a mere trick of language, for triple dexterity is required, not only to train the hand to the needful adroitness, but to acquire the requisite command of eye and tongue.

Besides the legitimate application of legerdemain to the purpose of amusement, it serves another and less innocent purpose, being employed by card sharps in their nefarious profession. The successful card sharper must have qualities which, if applied in a legitimate direction, would ensure distinction in almost any profession. He must be observant, dexterous, cool; but above all he must have impudence. If it requires a considerable share of this quality to perform an ordinary feat of legerdemain with all the advantages of scenic effects and stage arrangements, how much more must it need to effect a trick under the very eyes of a vigilant adversary, and when the consequences of failure are so extremely unpleasant! As in legitimate conjuring, too, it is not so much that actual dexterity or the quickness of the hand deceives the eye as that the attention is diverted by some ingenious but unperceived device at the moment when the operation is performed.

Legerdemain as applied to cheating at cards may be divided into the following branches:—(1) marking the cards; (2) abstracting certain cards during the game for clandestine use; (3) previously concealing cards about the person; (4) packing the cards; (5) substituting marked or prepared packs; (6) confederacy; (7) false shuffles. All these methods are thoroughly exposed in Robert-Houdin's work *Les tricheries des Grés*.

In addition to the works on conjuring already mentioned, reference may be made to *Sleights of Hand*, by Edwin Sachs. (E. H. F.)

LEGHORN (Italian, *Livorno*), a city of Italy, the chief town of the province of Leghorn (which includes the island of Elba), the see of a bishop, and next to Genoa and Naples the greatest commercial port in the kingdom, is situated on the coast of the Ligurian Sea, in $43^{\circ} 33' N$ lat and $10^{\circ} 10' E$ long, 15 miles south-west of Pisa, with which it is connected by a branch from the main west coast line. It is built on low-lying ground backed by a ridge of hills, of which the most striking though not the highest is Monte Nero, with its ancient monastery. In some respects one of the least Italian of Italian cities, Leghorn owes its

prosperity as a port not so much to any special advantages of situation as to wise legislation and labour. Broad and well-kept streets, spacious squares, and large substantial houses are the general characteristics of the city, which has room enough within the circuit of its walls (built 1835-37), though it has scattered its villas on the neighbouring hills and coast. Of note among the buildings are the old cathedral (a Latin cross with a single nave—the facade designed by Inigo Jones), the town-hall, the great oil warehouses erected by Cosmo III in 1705, the reservoir (a subterranean structure dating from the time of Ferdinand II.), and the Jewish synagogue, which ranks next to that of Amsterdam. Near the port stands the statue of Ferdinand I by Giovanni dell'Opera, with four slaves in bronze, by Pietro Tacca, chained to the pedestal; and the Piazza Carlo Alberto is adorned with statues of the grand dukes Ferdinand III. and Leopold II. The old English cemetery (closed 1839), which was up to the present century the only Protestant burial-place in Italy, contains the tombs of Smollett and Francis Horner. The Torre del Marzocco, or "Tower of the Sculptured Lion," is one of the

leading landmarks of the city from the sea, and almost the only relic of the republican period. Among the public institutions are the "Chambers of Public Payments," similar to the London clearing-house, a large naval academy opened in 1881, a chamber of commerce dating from 1801, a public library of 40,000 volumes, and a technical and nautical institute. Great changes have been effected in the port of Leghorn since the middle of the century. The "new port" is formed by a breakwater finished in 1863, which extends north and south for 3300 feet, at a distance of 6 furlongs from the shore. It has a general depth of from 24 to 32 feet. Vessels moored to the breakwater are sheltered from all winds, but those in the open part of the basin are exposed to the southerly gales. The inner or old port, formed by a pier projecting half a mile in a north-north-west direction from the shore, measures 1800 by 1500 feet, and is perfectly secure on all sides. To the south and east he a number of docks, which in turn are connected with a system of canals complex enough to justify the name Little Venice applied to part of the city. The Canale dei Navicelli extends north to the Arno. Dredging operations for deepening the harbour having been carried on between 1868 and 1878 with little permanent result, a much more extensive and effective series of improvements (including the construction of a new breakwater from the shore south of the town to the old lighthouse, and the lengthening of the dry dock so as to take in the largest ships now obliged to dock at Marseilles), received the Government sanction in 1881. Shipbuilding is the principal local industry, and even ironclads have been sent out from the dockyards. The following table shows the foreign trade of the port to have declined since 1860, but a counterbalancing increase to have taken place in the coasting trade —

Foreign Trade				Coasting Trade					
Ships	Tonnage	Ships	Tonnage	Ships	Tonnage	Ships	Tonnage		
1861	1,147	986,457	10,108	562,652	1871	1,064	621,312	7,053	1,215,937

In the early part of the century Leghorn became a great depot of British commerce with the Levant, and about twenty British firms were settled in the town. It was a free port, and had an excellent bonding system. But about 1833 the increase of direct intercourse between Britain and her customers began to tell on the trade, and it gradually disappeared altogether. At present the activity of the port is due to exportation of Italian produce (especially from Tuscany), and the importation of iron, coal, fish, and general goods. Marseilles, Cardiff, and Newcastle are the three ports with which the dealings are most extensive. A considerable trade is also maintained with the United States. The population of Leghorn city increased from 33,000 in 1807 to 83,543 in 1861; but in 1871 it was 80,948, and in 1881 only 77,781, a decrease due mainly to the distribution of the population beyond the city limits, especially along the coast. The communal population was 97,096 in 1871, and 97,615 in 1881. Between the city and the village of Aidenza are many seaside residences, occupied mostly by foreign visitors during the bathing season.

The earliest mention of Leghorn occurs in a document of the year 891 relating to the first church, in 1017 it is called a castle. In the 13th century the Pisans tried to attract a population to the spot, but it was not till the 14th that Leghorn began to be the rival of Porto Pisano, which was destined

ultimately to supplant. It was at Leghorn that Urban V. and Gregory XI. landed on their return from Avignon. When in 1405 the king of France sold Pisa to the Florentines he kept possession of Leghorn, but he afterwards (1407) sold it for 26,000 ducats to the Genoese, and from the Genoese the Florentines purchased it in 1421. In 1498 the city showed its devotion to its new masters by a successful defence against Maximilian and his allies. With the rise of the Medici came a rapid increase of prosperity; Cosmo, Francis, and Ferdinand erected fortifications and harbour works, warehouses and churches, with equal liberality, and the last especially gave a stimulus to trade by inviting "men of the East and the West, Spanish and Portuguese, Greeks, Germans, Italians, Hebrews, Turks, Moors, Armenians, Persians, and others," to settle and traffic in the city. Declared free and neutral in 1691, Leghorn was permanently invested with these privileges by the Quadruple Alliance in 1718; but in 1799 Napoleon seized all the hostile vessels in its port. It ceased to be a free city by law of 1867.

LEGION OF HONOUR, **ORDER OF THE**. This order of merit was instituted by Napoleon in 1802, all previously existing French military or religious orders—those of St Michael, the Holy Ghost, St Louis, and Military Merit, as well as the united orders of St Lazarus and Our Lady of Mount Carmel—having been abolished at the Revolution. All soldiers on whom claims of honour had been already conferred were forthwith declared to be members, and all citizens of sufficient merit were declared to be eligible for admission, whatever their birth, rank, religion, or social position might be. At their reception they were required to swear upon their honour to employ all just, reasonable, and lawful means for the service of the republic, the maintenance of its territory, the support of the government, the law, and the public property, and to withstand every effort towards the restoration of the feudal system and its various accompaniments—in short, to co-operate as much as in them lay for the assertion of the principles of freedom and equality. The grand master was Napoleon himself; under him were 105 grand officers, 300 commanders, 450 officers, and 3665 chevaliers. To the members of the various classes yearly allowances, ranging from 5000 francs in the case of a grand officer to 200 in that of a chevalier, were assigned. Some unimportant modifications in details were made when the empire was introduced. Between 1805 and 1814 about 43,000 nominations were made, 1400 only being in favour of civilians. Shortly after the accession of Louis XVIII. considerable changes took place. The old military and religious orders were restored, and that of the Legion of Honour reduced to the last place; the king was of course its grand master; the membership was divided into five grades—80 grand crosses, 160 grand officers, 400 commanders, 2000 officers, and an indefinite number of chevaliers. These fixed numbers were to be exclusive of members of the royal family, princes of the blood, and foreigners. Admission (the reward of at least twenty-five years of distinguished service) in ordinary cases was to be made to the grade of chevalier only; and only chevaliers of more than four years' standing, officers of two years' standing, and commanders of three years were to be eligible for promotion. The admissions were in every case to be made on parade in the case of military persons, and at a public sitting of a court of first instance in the case of civilians. The terms of the oath required, were of course, somewhat modified, and the arrangements about yearly allowances could not be continued. After the revolution of July, the "Ordre royal de la légion d'honneur" again resumed the unique place and special character which had belonged to it under Bonaparte in 1802. But its constitution was again remodelled in 1852; the numbers of grand crosses, grand officers, commanders, and officers were fixed respectively at 80, 200, 1000, and 2000, the number of chevaliers being still left vague, while the system of annual allowances was restored. Since 1870 the maximum number of chevaliers has been fixed at 25,000, the remaining four classes having 70, 200, 1000, and 4000

assigned to them respectively. In each grade three-fifths must be military persons, the rest civilians. The yearly pension of a military chevalier is 250 francs, of an officer 500, of a commander 1000, of a grand officer 2000, and of a grand cross 3000. The order may be conferred upon foreigners, but these do not count. It has occasionally been conferred upon women (e.g., Rosa Bonheur). In connection with the order there is an army medal, which may be distributed to the number of 40,000, and which entitles the bearer to a pension of 100 francs. On January 1, 1874, the military members of the legion, in point of fact, numbered 39,793, drawing 12,718,050 francs annually, and there were 51,460 holders of military medals, drawing 5,146,000 francs, besides not less than 15,000 civil members drawing no pension. By economy in making new appointments, these numbers have subsequently been reduced. Since 1805 there has existed an institution for the education of daughters, sisters, and nieces of members of the legion; in 1809 the numbers were fixed at 600, the place being the "Maison d'éducation de Saint Denis." The arrangements have subsequently been considerably extended. The decoration under the first empire consisted of a white enamelled five-rayed star, bearing the portrait of Napoleon, and a wreath of oak and laurel, with the words "Napoléon, empereur des Français"; on the reverse was the French eagle grasping a thunderbolt, and the legend "Honneur et patrie." The ribbon was of watered scarlet silk. At present the obverse of the star bears the emblem of the republic and the words "République Française," the reverse two tricolor flags with the original legend.

LEH, or Lâ. See **LADIA**.

LEIAH, a town in Derâ Ismail Khan district, Punjab, India, is situated near the east bank of the Indus, in 30° 57' 30" N. lat., 70° 58' 30" E. long. The population in 1868 was 17,093 (13,151 Mohammedans, 3756 Hindus, 30 Sikhs, and 126 "others"). There is a considerable trade in local produce as well as through traffic between the districts of upper India and the countries to the west.

LEIBNITZ, or **LEHNIZ**, **GOTTFRIED WILHELM** (1646–1716), almost equally distinguished as philosopher, mathematician, and man of affairs, was born on the 21st June (o.s.) 1646, at Leipsic, where his father was professor of moral philosophy. The name Leibniz, Leibnitz, or Lubebeck was originally Slavonic, but his family was German, and for three generations his ancestors had been in the employment of the Saxon Government. Young Leibnitz was sent to the Nicolai school at Leipsic, but from the time of his father's death, which took place when he was only six years old, seems to have been for the most part his own teacher. From his father he had acquired a love of historical study that bore remarkable fruit in after life. The German books at his command were soon all read through, and with the help of two Latin books which fell in his way—the *Theophrastus Chronologicus* of Calvisius and an illustrated edition of Livy—he learned Latin for himself at the age of eight. By the advice of a neighbouring gentleman his father's library was now thrown open to him with the permission "Tolle, lege." At this his joy knew no bounds. "For," he says, "I burned to get sight of the ancients, most of them known to me only by name, Cicero and Seneca, Pliny, Herodotus, Xenophon, Plato, and the historical writers, and many church fathers, Latin and Greek." Thus before he was twelve he could read Latin easily and had begun Greek; and his facility in writing Latin verses made his instructors fear that he would be seduced by poetry from more serious pursuits. Next he took with avidity to the study of logic, attempting already to reform its doctrines, and reading the scholastics and some of the Protestant theologians with such zeal that his

friends now began to fear that he would never leave scholastic subtleties, "not knowing," as he said, "that my mind could not be satisfied with one kind of things."

In the autumn of 1681, at the age of fifteen, he entered the university of Leipzig as a student of law. His first two years were devoted to philosophy under Scherzer, a follower of the scholastics, and Jacob Thomasius, a Neo-Aristotelian, who is looked upon as having founded the scientific study of the history of philosophy in Germany. It was at this time probably that he first made acquaintance with the modern thinkers who had already revolutionized science and philosophy, Francis Bacon, Cardan, and Campanella, Kepler, Galileo, and Descartes; and he began to discuss with himself the difference between the old and new ways of regarding nature. "I remember," he says, "walking alone, at the age of fifteen, in a wood near Leipze called the Rosenthal, to deliberate whether I should retain the doctrine of substantial forms. At last mechanism triumphed and induced me to apply myself to mathematics." It was not, however, till the summer of 1683, which he spent at Jena under Weigel, that he obtained the instructions of a mathematician of repute, nor was the deeper study of mathematics entered upon till his visit to Paris and acquaintance with Huygens many years later.

The three years following his return from Jena were devoted to legal studies, and in 1686 Leibnitz became a candidate for the degree of doctor of law. The doctorate was a pathway to the post of assessor which he coveted, but through the opposition of older candidates for the same office his youth was made an excuse for refusing him the degree. Upon this he left his native town for ever. The doctor's degree refused him there was at once (November 5, 1686) conferred on him at Altdorf, — the university town of the free city of Nuremberg, — where his brilliant dissertation procured him the immediate offer of a professor's chair. This, however, he declined, having, as he said, "very different things in view."

Leibnitz, not yet twenty-one years of age, was already the author of several remarkable essays. In his bachelor's dissertation *De principio individui* (1683), he defended the nominalistic doctrine that individuality is constituted by the whole entity or essence of a thing; his arithmetical tract *De complexionebus*, published in an extended form under the title *De arte combinatoria* (1666), is an essay towards his life-long project of a reformed symbolism and method of thought; and besides these there are four juridical essays, including the *Novus methodus docendi descendique juris*, written in the intervals of his journey from Leipzig to Altdorf. This last essay is remarkable, not only for the reconstruction it attempted of the *Corpus Juris*, but as containing the first clear recognition of the importance of the historical method in law.

Rejecting the professional career, but without any definite plan for the future, Leibnitz turned his steps to Nuremberg. That city was a centre of the Rosicrucians, and Leibnitz, busying himself with writings of the alchemists, soon gained such a knowledge of their tenets that he was supposed to be one of the secret brotherhood, and was even elected their secretary. A more important result of his visit to Nuremberg was his acquaintance with Johann Christian von Bönneburg, formerly first minister to the elector of Mainz, and one of the most distinguished statesmen of the day. By his advice Leibnitz printed his *Novus methodus* in 1687, dedicated it to the elector, and, going to Mainz, presented it to him in person. It was thus that Leibnitz entered the service of the elector of Mainz, at first as an assistant in the revision of the statute-book, afterwards on more important work.

The policy of the elector, which the pen of Leibnitz was now called upon to promote, was to maintain the security

of the German empire, threatened on the west by the aggressive power of France, on the east by Turkey and Russia. Thus when in 1669 the crown of Poland became vacant, it fell to Leibnitz to support the claims of the German candidate, which he did in his first political writing, *Specimen demonstrationum politicarum*, attempting, under the guise of a Catholic Polish nobleman, to show by mathematical demonstration that it was necessary in the interest of Poland that it should have the count palatine of Neuburg as its king. But neither the diplomatic skill of Bönneburg, who had been sent as plenipotentiary to the election at Warsaw, nor the arguments of Leibnitz were successful, and a Polish prince was elected to fill the vacant throne.

A greater danger threatened Germany in the aggressions of Louis XIV. and the wars of conquest on which he was entering. Though Holland was in most immediate danger from his arms, the seizure of Lorraine in 1670 showed that Germany too was threatened. It was in this year that Leibnitz wrote his *Thoughts on Public Safety*,¹ in which he urged the formation of a new "Reimbund" for the protection of Germany, and contended that the states of Europe should employ their power, not against one another, but in the conquest of the non-Christian world, in which Egypt, "one of the best situated lands in the world," would fall to the share of France. The plan thus proposed of averting the threatened attack on Germany by a French expedition to Egypt was discussed with Bönneburg, and obtained the approval of the elector. French relations with Turkey were at the time so strained as to make a breach imminent, and at the close of 1671, about the time when the war with Holland broke out, Louis himself was approached by a letter from Bönneburg and a short memorial from the pen of Leibnitz, who attempted to show that Holland itself, as a mercantile power trading with the East, might be best attacked through Egypt, while nothing would be easier for France or would more largely increase her power than the conquest of Egypt. On February 12, 1672, a request came from the French secretary of state, Pomponne, that the author of the memorial should further explain himself, and on the 18th of next month Leibnitz started for Paris. Louis seems still to have kept the matter in view, but never granted Leibnitz the personal interview he desired, while Pomponne wrote from the camp before Dossburg, "I have nothing against the plan of a holy war, but such plans, you know, since the days of St Louis, have ceased to be the fashion." Not yet discouraged, Leibnitz wrote a full account of his project for the king,² and a summary of the same³ evidently intended for Bönneburg. But Bönneburg died in December 1672, before the latter could be sent to him. Nor did the former ever reach its destination. The French quarrel with the Porte was made up, and the plan of a French expedition to Egypt disappeared from practical politics till Napoleon menaced the power of England by the same means as those by which Louis had been invited to cripple Holland. The history of this scheme, and the reason of Leibnitz's journey to Paris, long remained hidden in the archives of the Hanoverian library. It was on his taking possession of Hanover in 1803 that Napoleon learned, through the *Consilium Aegyptiacum*, that the idea of a French conquest of Egypt had been first put forward by a German philosopher. In the same year there was published in London an account of the *Iusta dissertatio*⁴ of which the British Government had procured a copy in 1799.

¹ *Bedanken, welchergestaltt securitas publicæ interna et externa und status præsentis germaniæ Umständten nach auf Jsten Fasse zu stellen.*

² *De ægyptiaca regni Franciæ proponenda iusta dissertatio.*

³ *Consilium Aegyptiacum.*
⁴ *A Summary Account of Leibnitz's Memoir addressed to Louis the Fourteenth, &c.* [edited by Granville Foss], London, 1808.

But it is only since the appearance of the edition of Leibnitz's works begun by Otto Kloppe in 1864 that the full history of the scheme has been made known.

Leibnitz had other than political ends in view in his visit to France. It was at the centre of literature and science that Paris chiefly attracted him. Political duties never made him lose sight of his philosophical and scientific interests. At Mainz he was still busied with the question of the relation between the old and new methods in philosophy. In a letter to Jacob Thomaeus (1669) he contends that the mechanical explanation of nature by magnitude, figure, and motion alone is not inconsistent with the doctrines of Aristotle's *Physica*, in which he finds more truth than in the *Meditations* of Descartes. Yet these qualities of bodies, he argues in 1668 (in an essay published without his knowledge under the title *Confessio naturæ contra atheistas*), require an incorporeal principle, or God, for their ultimate explanation. He also wrote at this time a defence of the doctrine of the Trinity against Wissovavius (1669), and an essay on philosophic style, introductory to an edition of the *Antibarbarus* of Nizolius (1670). Clearness and distinctness alone, he says, are what makes a philosophic style, and no language is better suited for this popular exposition than the German. In 1671 he issued a *Hypothesis physica nova*, in which, agreeing with Descartes that corporeal phenomena should be explained from motion, he carried out the mechanical explanation of nature by contending that the original of this motion is a fine æther, similar to light, or rather constituting it, which, penetrating all bodies in the direction of the earth's axis, produces the phenomena of gravity, elasticity, &c. The first part of the essay, on concrete motion, was dedicated to the Royal Society of London, the second, on abstract motion, to the French Academy.

Leibnitz thus came to Paris, not merely as a young diplomatist on an important if not very hopeful mission, but also as an author who had already made his debut in the world of science and philosophy. At Paris he met with Arnould, Malebranche, and, more important still, with Christian Huygens. This was pre-eminently the period of his mathematical and physical activity. Before leaving Mainz he was able to announce¹ an imposing list of discoveries, and plans for discoveries, arrived at by means of his new logical art, in natural philosophy, mathematics, mechanics, optics, hydrostatics, pneumatics, and nautical science, not to speak of new ideas in law, theology, and politics. Chief among these discoveries was that of a calculating machine for performing more complicated operations than that of Pascal—multiplying, dividing, and extracting roots, as well as adding and subtracting. This machine was exhibited to the Academy of Paris and to the Royal Society of London, and Leibnitz was elected a fellow of the latter society in April 1673.² In January of this year he had gone to London as an attaché on a political mission from the elector of Mainz, returning in March to Paris, and while in London had become personally acquainted with Oldenburg, the secretary of the Royal Society, with whom he had already corresponded, with Boyle the chemist, and Pell the mathematician. It is from this period that we must date the impulse that directed him anew to mathematics. By Pell he had been referred to Mercator's *Logarithmo-technica* as already containing some numerical observations which Leibnitz had thought original on his own part; and, on his return to Paris, he devoted himself to the study of higher geometry under Huygens, entering almost at once upon the series of investigations which culminated in his discovery of the

differential and integral calculus. For the history of this discovery and of the controversies to which it gave rise, see vol. xiii. p. 8 sq.

Shortly after his return to Paris in 1673, Leibnitz ceased to be in the Mainz service any more than in name, but in the same year entered the employment of Duke John Frederick of Brunswick-Lüneburg, with whom he had corresponded for some time. In 1676 he removed at the duke's request to Hanover, travelling thither by way of London and Amsterdam. At the latter place he saw and conversed with Spinoza, now in the last year of his life.

For the next forty years, and under three successive princes, Leibnitz was in the service of the Brunswick family, and his headquarters were at Hanover, where he had charge of the ducal library. In leaving the electorate of Mainz for the dukedom of Brunswick, Leibnitz passed into a political atmosphere formed by the dynastic aims of the typical German state. The recognition of the rights of the dukedom amongst the states of Europe, the consolidation and permanence of the reigning house, the union of the two branches of the Brunswick family, and lastly, —the aim to which all the others led up—the attainment of the electoral list, were the ends of its political action. Leibnitz had thus to support by his pen the claim of Hanover to appoint an ambassador at the congress of Nimègue (1678)³ to defend the establishment of primogeniture in the Lüneburg branch of the Brunswick family; and, when the proposal was made to raise the duke of Hanover to the electorate, with the charge of the imperial banner, he had to show that this did not interfere with the rights of the duke of Württemberg, who was the hereditary custodian of the imperial colours. It was in 1692 that the duke of Hanover was made elector. Before, and with a view to this, Leibnitz had been employed by him to write the history of the Brunswick-Lüneburg family, and, to collect material for his history, had undertaken a journey through Germany and Italy in 1687–90, visiting and examining the records in Marburg, Frankfurt-on-the-Main, Munich, Vienna (where he remained nine months), Venice, Modena, and Rome. At Rome he was offered the custodianship of the Vatican library on condition of his joining the Catholic Church.

About this time too his thoughts and energies were partly taken up with the scheme for the reunion of the Catholic and Protestant Churches. While at Mainz he had joined in an attempt made by the elector and Boineburg to bring about a reconciliation, and now, chiefly through the energy and skill of the Catholic Royas de Spinoia, and from the spirit of moderation which prevailed among the theologians he met with at Hanover in 1683 it almost seemed as if some agreement might be arrived at. It was in these circumstances that, in 1686, Leibnitz wrote his *Systema theologicum*,⁴ in which he strove to find common standing-ground for Protestants and Catholics in the details of their creeds. But the English Revolution of 1688, and the establishment of the Protestant succession, became a political obstacle to the prosecution of the scheme in Hanover, while it was soon found that the religious difficulties were greater than had at one time appeared. Spinoia's practical and conciliatory tone did not make full allowance for the ecclesiastical and dogmatical claims of Rome, and the moderation of the Hanover theologians was not fairly representative of the spirit of the Protestant Churches. In the letters to Leibnitz from Bossuet, the

² Not published till 1816. It is on this work that the assertion has been founded that Leibnitz was at heart a Catholic—a supposition clearly disproved by his correspondence.

³ In a letter to the duke of Brunswick-Lüneburg (autumn 1671), *Werke*, ed. Kloppe, iii. 258 sq.

⁴ He was made a foreign member of the French Academy in 1700.

landgrave of Hessen-Rheinfels, and Madame de Brion, the aim is obviously to make converts to Catholicism, not to arrive at a compromise with Protestantism, and when it was found that Leibnitz refused to be converted the correspondence ceased. A further scheme of church union in which Leibnitz was engaged, that between the Reformed and Lutheran Churches, met with no better success.

Returning from Italy in 1690, Leibnitz was appointed librarian at Wolfenbützel by Duke Anton of Brunswick-Wolfenbützel. Some years afterwards began his connexion with Berlin through his friendship with the electress Sophie Charlotte of Brandenburg and her mother the princess Sophie of Hanover. He was invited to Berlin in 1700, and on the 11th July of that year the academy he had planned was founded, with himself as its president for life. In the same year he was made a privy councillor of justice by the elector of Brandenburg. Four years before he had received a like honour from the elector of Hanover, and twelve years afterwards the same distinction was conferred upon him by Peter the Great, to whom he gave a plan for an academy at St Petersburg, carried out after the czar's death. At Berlin, in the pleasant suburb of Charlottenburg, Leibnitz read and philosophized with his royal pupil, whose death in 1705 was the greatest loss he ever suffered. After this event his visits to Berlin became less frequent and less welcome, and in 1711 he was there for the last time. In the following year he undertook his fifth and last journey to Vienna, where he stayed till 1714. An attempt to found an academy of sciences there was defeated by the opposition of the Jesuits, but he now attained the honour he had coveted of an imperial privy councillorship (1713), and either at this time or on a previous occasion, was made a baron of the empire (*Reichsfreiherr*). Leibnitz returned to Hanover in September 1714, but found the elector George Louis had already gone to assume the crown of England. Leibnitz would gladly have followed him to London, but was bidden remain at Hanover and finish his history of Brunswick.

During the last thirty years Leibnitz's pen had been busy with many matters. Mathematics, natural science,¹ philosophy, theology, history, jurisprudence, politics (particularly the French war with Germany, and the question of the Spanish succession), economics, and philology, all gained a share of his attention; almost all of them he enriched with original observations.

His genealogical researches in Italy—through which he established the common origin of the families of Brunswick and Este—were not only preceded by an immense collection of historical sources, but enabled him to publish materials for a code of international law.² The history of Brunswick itself was the last work of his life, and had covered the period from 788 to 1005 when death ended his labours. But the Government, in whose service and at whose order the work had been carried out, left it to him unhindered in the archives of the Hanover library, till it was published by Pertz in 1843.

It was in the years between 1690 and 1716 that Leibnitz's chief philosophical works were composed, and during the first ten of these years the accounts of his system were, for the most part, preliminary sketches. Indeed, he never gave a full and systematic account of his doctrines. His views have to be gathered from letters to friends, from occasional articles in the *Acta Eruditorum*, the *Journal des Savants*, and other journals, and from one or two more extensive works. It is evident, however, that philosophy

had not been entirely neglected in the years in which his pen was almost solely occupied with other matters. A letter to the duke of Brunswick, and another to Arnauld, in 1671, show that he had already reached his new notion of substance; and it seems to have been the want of leisure and opportunity alone that prevented the systematic expression of his views. In a letter to Arnauld, of date March 23, 1690, the leading peculiarities of his system are clearly stated. The appearance of Locke's *Essay* in 1690 induced him (1696) to note down his objections to it, and his own ideas on the same subjects. In 1703-4 these were worked out in detail and ready for publication, when the death of the author whom they criticized prevented their appearance (first published by Raspe, 1765). In 1710 appeared the only complete and systematic philosophical work of his life-time, *Essais de Théodicée sur la bonté de Dieu, la liberté de l'homme, et l'origine du mal*, originally undertaken at the request of the late queen of Prussia, who had wished a reply to Bayle's opposition of faith and reason. In 1714 he wrote, for Prince Eugene of Savoy, a sketch of his system under the title of *La Monadologie*, and in the same year appeared his *Principes de la nature et de la grace*. The last few years of his life were perhaps more occupied with correspondence than any others, and, in a philosophical regard, were chiefly notable for the letters which, through the desire of the new queen of England, he interchanged with Clarke, *sur Dieu, l'âme, l'espace, la durée*.

Leibnitz died on the 14th November 1716, his closing years enfeebled by disease, harassed by controversy, embittered by neglect, darkened by the loss of his dearest friend; but to the last he preserved the indomitable energy and power of work to which is largely due the position he holds as, more perhaps than any one in modern times, a man of almost universal attainments and almost universal genius. Neither at Berlin, in the academy which he had founded, nor in London, whither his sovereign had gone to rule, was any notice taken of his death. At Hanover, Eckhart, his secretary, was his only mourner, no courtiers, no clergyman followed him to the grave, not till 1787 was the simple monument that marks the place erected; "he was buried," says an eye-witness, "more like a robber than what he really was, the ornament of his country."³ Only in the French Academy was the loss that had been sustained recognized, and a worthy eulogium devoted to his memory (November 13, 1717).

Accustomed from his boyhood to a studious life, Leibnitz possessed a wonderful power of rapid and continuous work, and for days together would hardly leave his chair. Even in travelling his time was employed in solving mathematical problems. He is further described as moderate in his desires and habits, quick of temper but easily appeased, charitable in his judgments of others, and tolerant of differences of opinion, though impatient of contradiction on small matters. He is also said to have been fond of money to the point of covetousness; he was certainly desirous of honour, and felt keenly the neglect in which his last years were passed.

Leibnitz's Philosophy. The central point in the philosophy of Leibnitz was only arrived at after many advances and corrections in his opinions. This point is his new doctrine of substance ("708"), and it is through it that unity is given to the succession of occasional writings, scattered over fifty years, in which he explained his views. More inclined to agree than to differ with what he read (p. 426), and borrowing from almost every philosophical system, his own standpoint is yet most closely related to that of Descartes, partly as consequence, partly by way of opposition. Cartesianism, Leibnitz often asserted, is the ante-room of truth, but the ante-room only. Descartes's separation of things into two heterogeneous substances only connected by the omnipotence of God, and the more logical

¹ In his *Prolegomena* (1681) he developed the notion of the historical genesis of the present condition of this earth's surface. Cf. O. Peschel, *Geogr. u. Erdkunde*, Munich, 1895, pp. 618 sq.

absorption of both by Spinoza into the one divine substance, followed from an erroneous conception of what the true nature of substance is. Substance, the ultimate reality, can only be conceived as force. Hence Leibniz's metaphysical view of the monads as simple, percipient, self-active beings, the constituent elements of all things, his physical doctrine of the reality and constancy of force at the same time that space, matter, and motion are merely phenomenal, and his psychological conception of the continuity and development of consciousness. In the closest connexion with the same stand his logical principles of consistency and sufficient reason, and the method he developed from them, his ethical end of perfection, and his crowning theological conception of the universe as the best possible world, and of God both as its efficient cause and its final harmony.

The ultimate elements of the universe are, according to Leibniz, individual centres of force or monads. Why they should be individual, and not manifestations of one world-force, he never clearly proves.¹ His doctrine of individuality seems to have been arrived at, not by strict deduction from the nature of force, but rather from the empirical observation that it is by the manifestation of its activity that the separate existence of the individual becomes evident, for his system individuality is as fundamental as activity. "The monads," he says, "are the very atoms of nature—in a word, the elements of things," but, as centres of force, they have neither parts, extension, nor figure (p. 705). Hence their distinction from the atoms of Democritus and the materialists. They are metaphysical points or rather spiritual beings whose very nature it is to act. As the bent bow springs back of itself, so the monads naturally pass and are always passing into action without any aid and but the absence of opposition (p. 123). Nor do they, like the atoms, act upon one another (p. 680); the action of each excludes that of every other. The activity of each is the result of its own past state, the determiner of its own future (pp. 703, 723). "The monads have no windows by which anything may go in or out" (p. 705).

Further, since all substances are of the nature of force, it follows that—"in imitation of the notion which we have of souls"—they must contain something analogous to feeling and appetite. It is the nature of the monad to represent the universe, and this is perception, by which external events are mirrored internally (p. 433). Through their own activity the monads mirror the universe (p. 725), but such in its own way and from its own point of view, that is, with a more or less perfect perception (p. 127); for the Cartesian view was wrong in assuming that the monad is not conscious, and identifying it with the reflex cognition of it which may be called apperception. Every monad is thus a microcosm, the universe in little,² and according to the degree of its activity is the distinctness of its representation of the universe (p. 709). Thus Leibniz, borrowing the Aristotelian term, calls the monads *enteliches*, because they have a certain perfection (*perfectionem*) and sufficiency (*abundantiam*) which make them sources of their internal actions and, so to speak, incorporeal antonets (p. 705). That the monads are not pure enteliches is shown by the differences amongst them. Excluding all external limitation, they are yet limited by their own nature. All created monads contain a passive element or *matéria prima* (pp. 440, 687, 726), in virtue of which their perceptions are more or less confused. As the activity of the monad consists in perception, this is inhibited by the passive principle, so that there arises in the monad an appetite or tendency to overcome the inhibition and become more percipient, which allows the change from one perception to another (pp. 708, 714). By the proportion of activity to passivity in it one monad is differentiated from another. The greater the amount of activity or of distinct perceptions the more perfect is the monad; the stronger the element of passivity, the more confused its perceptions, the less perfect is it (p. 709). This could be a divinity had it nothing but distinct perceptions (p. 620).

The monad is never without a perception; but, when it has a number of little perceptions with no means of distinction, a state similar to that of being stunned ensues, the monad *vis* being perpetually in this state (p. 707). Between this and the most distinct perception there is room for an infinite diversity of nature among the monads themselves. Thus no one monad is exactly the same as another; for, were it possible that there should be two identical, there would be no sufficient reason why God, who brings them into actual existence, should put one of them at one definite time and place, the other at a different time and place. This is Leibniz's principle of the *identity of indiscernibles* (pp. 277, 755); by it his early problem as to the principle of individuation is solved by the distinction between *res* and individual being abolished, and every individual made *res generis*. The principle thus established is formulated in Leibniz's law of continuity, founded, he says, on the doctrine of the infinite, essential to geometry, and of the utmost importance in physics (pp. 104, 105), in accordance with which

there is neither vacuum nor break in nature, but "everything takes place by degrees" (p. 823), the different species of creatures rising by measurable steps from the lowest to the most perfect form (p. 812).

As in every monad each succeeding state is the consequence of the preceding, and as it is of the nature of every monad to mirror or represent the universe, it follows (p. 774) that the percipient content of each monad is in "accord" or correspondence with that of every other (cf. p. 127), though this content is represented with infinitely varying degrees of perfection. This is Leibniz's famous doctrine of pre-established harmony, in virtue of which the infinitely numerous independent substances of which the world is composed are related to each other and form one universe. It is essential to notice that it proceeds from the very nature of the monads as percipient, self-acting beings, and not from an arbitrary determination of the Deity.

From the harmony of self-determining percipient units Leibniz has to explain the world of matter and mind. As everything that really exists is of the nature of spiritual or metaphysical points (p. 126), it follows that space and matter in the ordinary sense can only have a phenomenal existence (p. 745), being dependent not on the nature of the monads themselves but on the way in which they are perceived. Considering that several things exist at the same time and in a certain order of coexistence, and mistaking this constant relation for something that exists outside of them, the mind forms the confused perception of space (p. 758). But space and time are merely relative, the former an order of coexistence, the latter of succession (pp. 682, 752). Hence not only the secondary qualities of Descartes and Locke, but their so-called primary qualities as well, are merely phenomenal (p. 445). The monads are really without position or distance from each other, but, as we perceive several simple substances, there is for us an aggregate or extended body. Body is thus actual extension (pp. 110, 115). The unity of the aggregate depends entirely on our perceiving the monads composing it together. There is no such thing as an absolute vacuum or empty space, any more than there are indivisible material atoms or atoms from which all things are built up (pp. 126, 188, 377). Body, corporeal mass, or, as Leibniz calls it, to distinguish it from the material *prima* of which every monad is composed, is *matéria secunda*, is thus only a "phenomenon *hinc fundatum*" (p. 438). It is not a *substantia* but *substantia* or *substantiam* (p. 745). While thus, however, is the only view consistent with Leibniz's fundamental principles, and is often clearly stated by himself, he has another aspect of the matter, namely, that of matter as a real substance, and of a real metaphysical bond between soul and body. But these expressions occur chiefly in the letters to Des Bosses, in which Leibniz is trying to reconcile his views with the doctrines of the Roman Catholic Church, especially with that of the real presence in the Eucharist, and are usually referred to by him as doctrines of faith or as hypothetical (see especially p. 850). The true *essentia substantialis* is not the *matéria secunda*, which is a consistent development of Leibniz's principles can only regard as phenomenal, but the *matéria prima*, through which the monads are individualized and distinguished and their connexion rendered possible. And Leibniz seems to recognize that the opposite assumption is inconsistent with his cardinal metaphysical view of the monads as the only realities.

From Leibniz's doctrine of force as the ultimate reality it follows that his view of nature must be throughout dynamical. And though he rejects as a *systeme* or theory of natural philosophy what we regard as the outlines of his own theory and his criticism of the mechanical physics of Descartes are known to us. The whole distinction between the two lies in the difference between the mechanical and the dynamical views of nature. Descartes started from the reality of extension as constituting the nature of material substance, and found in magnitude, figure, and motion the explanation of the material universe. Leibniz too admitted the mechanical view of nature as giving the laws of corporeal phenomena (p. 438), applying also to everything that takes place in animal organisms,³ even the human body (p. 777). But, as phenomenal, these laws must find their explanation in metaphysics, and thus in final causes (p. 155). All things, he says (in his *Opuscula Dynamica*), can be explained either by efficient or by final causes. But the latter method is not appropriate to individual occurrences,⁴ though it must be applied when the laws of mechanism themselves need explanation (p. 678). For Descartes's doctrine of the constancy of the quantity of motion (*q. incommutabilis*) in the world Leibniz substitutes the principle of the conservation of *vis viva*, and contends that the Cartesian position that motion is measured by velocity should be superseded by the law that moving force (*vis motrix*) is measured by the square of the velocity (pp. 182, 193). The long controversy raised by this contention was really caused by the technical use of the term employed. The principles held by Descartes and Leibniz were both correct, though different, and their conflict only apparent. Descartes's

² Cf. *Opera*, ed. Dutrue, II. p. 10.

³ The difference between an organic and an inorganic body consists, he says, in this, that the former is a machine *en son* in its smallest parts.

⁴ *Opera*, ed. Dutrue, III. p. 251.

principle is now enunciated as the conservation of momentum, that of Leibnitz as the conservation of energy. Leibnitz further criticizes the Cartesian view that the mind can alter the direction of motion though it cannot initiate it, and contends that the quantity of "ess directed," estimated between the same parts, is constant (p. 108)—a position developed in a statistical theorem for determining geometrically the resultant of any number of forces acting at a point.

Lake the monad, body, which is its analogue, has a passive and an active element. The former is the capacity of resistance, and includes impenetrability and inertia; the latter is active force (p. 255, 637). Bodies, then, like the monads, are self-contained activities, receiving no impulse from without—its only by an accommodation to ordinary language that we speak of them as doing so—without moving themselves in harmony with each other (p. 260).

The psychology of Leibnitz is chiefly developed in the *Nouveaux Essais sur l'entendement humain*, written in answer to Locke's famous *Essay*, and criticizing it chapter by chapter. In these essays he worked out a theory of the origin and development of knowledge in harmony with his metaphysical views, and thus without Locke's implied assumption of the mutual influence of soul and body. When one monad in an aggregate perceives the others so clearly that they are in comparison with it mere monads (*monades enus*), it is said to be the ruling monad of the aggregate, not because it actually does exert an influence over the rest, but because, being in close correspondence with them, and yet having so much clearer perception, it seems to do so (p. 683). This monad is called the entelechy or soul of the aggregate or body, and as such mirrors the aggregate in the first place and the universe through it (p. 710). Each soul or entelechy is surrounded by an infinite number of monads forming its body (p. 714); soul and body together make a living being, and, as their laws are in perfect harmony—a harmony established between the whole realm of final causes and that of efficient causes (p. 714)—we have the same result as if one influenced the other. This is further explained by Leibnitz in his well-known illustration of the different ways in which two clocks may keep exactly the same time. The machinery of the one may actually move that of the other, or whenever one moves the mechanism may make a similar alteration in the other, or they may have been so perfectly constructed at first as to continue to correspond at every instant without any further influence (pp. 133, 134). The first way represents the common (Locke's) theory of mutual influence, the second the method of the occasionalists, the third that of pre-established harmony. Thus the body does not act on the soul in the production of cognition, nor is it continued to correspond at every instant without any further influence (pp. 133, 134). The body just as it had no soul, the soul as if it had no body (p. 711). Instead, therefore, of all knowledge coming to us directly or indirectly through the bodily senses, it is all developed by the soul's own activity, and sensuous perception is itself but a confused kind of cognition. The body is the instrument of the soul only (cf. Descartes' field), but all our ideas are innate, though only worked up into actual cognition in the development of knowledge (p. 212). To the aphorism made use of by Locke, "Nihil est in intellectu quod non prius fuerit in sensu," must be added the clause, "mai intellectus ipse" (p. 228). The soul at birth is not comparable to a *tabula rasa*, but rather to an unworked block of marble, the hidden veins of which already determine the form it is to assume in the hands of the sculptor (p. 108). Nor, again, can the soul ever be without perception; for it has no other nature than that of a perpetual active being (p. 248). Apparently dreamless sleep is to be accounted for by unconscious perception (p. 228) and it is by such unmeaning perceptions that Leibnitz explains his doctrine of pre-established harmony (p. 197).

In the human soul perception is developed into thought, and there is thus an infinite though gradual difference between it and the mere monad (p. 464). As all knowledge is innate in our mind, it follows that its perfection depends on the efficiency of the instrument by which it is developed. Hence the importance, in Leibnitz's system, of the logical principles and method the consideration of which occupied him at intervals throughout his whole career.

There are two kinds of truth—(1) truths of reasoning, and (2) truths of fact (pp. 83, 98, 707). The former rest on the principles of identity (or contradiction) or of possibility, in virtue of which that is false which contains a contradiction, and that true which is contradictory to the false. The latter rest on the principle of sufficient reason or of reality (*compossibilité*), according to which no fact is true unless there is a sufficient reason why it should be as it is and not otherwise (agreeing thus with the *principium veritatis* or final cause). God alone, the purely active monad, has an *a priori* knowledge of the latter class of truths, they have their source in the human mind only in so far as it mirrors the outer world, i. e., in 39 positively, whereas the truths of reason have their source in our mind in itself or in its activity.

Both kinds of truths fall into two classes, primitive and derivative. The primitive truths of fact are, as Descartes held, those of internal experience, and the derivative truths are inferred from them in accordance with the principle of sufficient reason, by their agreement with our perception of the world as a whole. They are thus

reached by probable arguments—a department of logic which Leibnitz was the first to bring into prominence (pp. 84, 164, 168, 169, 248). The primitive truths of reasoning are identical (in later terminology, analytical) propositions, the derivative truths being deduced from them by the principle of contradiction. The part of his logic on which Leibnitz laid the greatest stress was the separation of these rational cognitions into their simplest elements—for he held that the root-notions (*conceptiones primae*) would be found to be few in number (pp. 92, 93)—and the designation of them by universal characters or symbols,¹ composite notions being denoted by the formulae formed by the union of several definite characters, and judgments by the relation of acquiescence among these formulae, so as to reduce the syllogism to a calculus. This is the main idea of Leibnitz's "universal characteristic," never fully worked out by him, which he regarded as one of the greatest discoveries of the age. An incidental result of its adoption would be the introduction of a universal symbolism of thought comparable to the symbolism of mathematics and intelligible in all languages (cf. p. 356). But the great revolution it would effect would chiefly consist in this, that truth and falsehood would be no longer matters of opinion but of correctness or error in calculation² (pp. 88, 84, 89, 83). What Adam Smith says is not to be superadded, but it is to be supplemented by this new method, for of itself it is but the ABC of logic.

But the logic of Leibnitz is an art of discovery (p. 85) as well as of proof, and, as such, applies both to the sphere of reasoning and to that of fact. In the former it has by attention to render explicit what is otherwise only implicit, and by the intellect to introduce order into the *a priori* truths of reason, so that one may follow from another and they may constitute together a *monade intellectuelle*. To this art of orderly combination Leibnitz attached the greatest importance, and to it one of his earliest writings was devoted. Similarly, in the sphere of experience, it is the art of discovery, by which we find out and classify the primitive facts of fact, referring every other fact to them as its sufficient reason, so that new truths of experience may be brought to light.

As the perception of the monad when clarified becomes thought, so the aspects of which all monads partake is raised to will, their spontaneity is freedom in man (p. 699). The will is an affect or tendency to that which one finds good (p. 251), and is free only in the sense of being exempt from external control³ (pp. 252, 513, 521), for it must always have a sufficient reason for its action determined by what seems good to it. The end determining the will is pleasure (p. 259), and pleasure is the sense of an increase of freedom (p. 670).

A man guided by reason will sacrifice transitory and pursue constant pleasures or happiness, and in this weighing of pleasures consists true wisdom. Leibnitz, like Spinoza, says that freedom consists in following reason, servitude in following the passions (p. 669), and that the passions proceed from confused perceptions (pp. 188, 299). In love one finds joy in the happiness of another; and from love follow justice and law.⁴ Our reason," says Leibnitz, "is illumined by the spirit of God, reveals the law of nature," and with its positive law must not conflict. Natural law rises from the strict command to avoid offence, through the maxim of equity which gives to each his due, to that of piety or piety (*bonitas verus*),—the highest ethical perfection,—which presupposes a belief in God, providence and a future life.⁵ Moral immortality—not merely the simple continuity which belongs to every monad—comes from God having provided that the changes of matter will not make man lose his individuality (pp. 126, 496).

Leibnitz thus makes the existence of God a postulate of morality as well as necessary for the realization of the monads. It is in the *Theodicee* that his theology is worked out and his view of the universe as the best possible world defended. In it he contends that faith and reason are essentially harmonious (pp. 402, 479), and that nothing can be received as an article of faith which contradicts an eternal truth, though the ordinary physical order may be superseded by a higher.⁶

The ordinary arguments for the being of God are retained by Leibnitz in a modified form (p. 875). Descartes' ontological proof is supplemented by the clause that God as the *ens* as such must either exist or be impossible (pp. 90, 177, 708). The cosmological proof⁷ he passes from the infinite series of finite causes to their sufficient reason which contains all changes in the series necessarily in itself (pp. 147, 708); and he argues teleologically from the existence of harmony among the monads without any mutual influence to God as the author of this harmony (p. 430).

¹ Different symbolic systems were proposed by Leibnitz at different periods of his life. Leibnitz's *Logic*, 1687, p. 37.

² The ideas of which Leibnitz anticipated the modern theory of logic mainly due to Boole are collected out in St. Yves's *Symbolica Logica*, 1881.

³ Hence the difference of the determinism from that of Spinoza, though Leibnitz too says "in one place that 'in his opinion the cosmological proof of the existence of God from those of the creature' (Werke, ed. Furtz, 3d ser., p. 100).

miles. The available coal in the Moira district is estimated at over 450,000,000 tons, and in the Coleorton district at over 350,000,000 tons. In 1870 the amount of coal produced was 599,450 tons, but for some years it has exceeded 1,000,000 tons, the number of collieries being about thirty. At a depth of 593 feet in the Moira coal-field there is a spring of salt-water, the brine of which is brought to Ashby-de-la-Zouch for use in scorbatic and rheumatic affections. Limestone is worked in various portions of the county, freestone is plentiful, gypsum is found, and a kind of granite, which is

extensively used for paving purposes, is obtained at Charnwood forest, Mount-Sorrel, Sapcote, and Stoney-Stanton.

Agriculture.—The climate is mild, and on account of the inland position of the county, and the absence of any very high elevations, the rainfall is very moderate. The soil is of a loamy character, the richest district being that to the east of the Soar, which is occupied by pasture, while the corn crops are grown chiefly on a lighter soil resting above the Red Sandstone formation. The following table gives a classification of holdings according to size, with the area under each class of holding.—

	60 Acres and under		From 60 to 100 Acres.		From 100 to 300 Acres		From 300 to 600 Acres.		From 600 to 1000 Acres		Above 1000 Acres.		Total.	
	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.
1874	5,974	77,381	958	69,044	1,466	248,036	105	69,090	25	16,815	2	2,800	470,006	
1880	5,832	74,464	990	65,469	1,407	244,180	139	66,483	26	21,776	2	2,605	473,956	

A large number of the holdings between 100 and 300 acres are possessed by owners who farm their own land. In 1881 the total area of arable land was 473,998 acres, of which 91,952 were under corn crop, 22,033 under green crop, 25,302 rotation grasses, 317,869 permanent pasture, and 16,842 fallow; 740 acres were under orchards, 345 market gardens, 125 nursery grounds, and 11,262 woods. It will be observed that the proportion of pasture is very great. The pasture land is especially rich along the banks of the rivers. Of corn crops 33,675 acres were under wheat, 27,724 barley, and 23,330 oats. The number of cows in 1881 was 33,863, the total number of cattle being 123,681, an average of 26 to every 100 acres under cultivation, the average for England being 16.9. There are many dairy farms for the manufacture of cheese, the famous Stilton cheese being made near Melton Mowbray. Horses numbered 18,085, the number used for agricultural purposes being 12,243. The breed was much improved by the importation by the well-known agriculturist Bakewell of mares from Flanders. As the county is famed for fox-hunting, there are many excellent riding horses. The number of sheep in 1881 was 263,383, an average of 51 to every 100 acres under cultivation, the average for England being 62.4. The famous New Leicesters, introduced by Bakewell, are the most common, but the Old Leicesters are still bred, and there is also a race of sheep peculiar to Charnwood forest. Pigs in 1881 numbered 21,765. According to the return of 1874, the land in 1872-73 was divided among 13,848 proprietors, possessing 519,524 acres, with an annual rental of £1,493,378, 10s. Of the owners only 35 per cent. possessed more than 1 acre, and the average value per acre all over was £2, 16s. Among the principal proprietors are the duke of Rutland, possessing 30,109 acres; Lord Donington, 10,174; Earl Hossa, 9755; the earl of Stamford and Warrington, 9012; and the earl of Dysart, 8420.

Manufactures.—The staple manufacture of the county is hosiery, for which the wool is obtained chiefly from home-bred sheep. Its principal seats are Leicester, Hinckley, and Loughborough. Cotton hose are likewise made, and the other industries include the manufacture of boots and shoes, elastic webbing, silk plush for hats and lace, agricultural implements, bricks and pottery, and artificial manures.

Administration and Population.—Leicestershire comprises six "hundreds," the municipal and parliamentary borough of Leicester (123,351), and five other towns with a population of over 5000, viz., Loughborough (14,783), Hinckley, partly in Warwickshire (7673), Ashby-de-la-Zouch (7465), Melton Mowbray (5766), and Market Harborough (5350). The population of the county, which in 1801 was only 130,030, was 215,867 in 1841, 269,311 in 1871, and 321,018 (165,429 males and 165,689 females) in 1881, the increase within the last ten years being 19.2 per cent

The county returns six members to Parliament,—two for North and two for South Leicestershire, and two for the borough of Leicester. It has one court of quarter sessions, and is separated into nine petty sessional divisions, with which the police divisions are nearly identical. The borough of Leicester has a commission of the peace, a separate court of quarter sessions, and also its own police. The county is almost wholly in the diocese of Peterborough, and contains 381 civil parishes, townships, or places, as well as parts of other parishes. It is included in the Midland circuit, and assizes and quarter sessions are held at Leicester.

History and Antiquities.—Before the Roman invasion Leicestershire was inhabited by the Coritani, and under the Romans it formed part of the province of *Flavia Caesariensis*. The principal Roman roads are the Watling Street, which forms for 20 miles the south-west boundary of the county from Deveredale near the Avon to near Atherstone, where it enters Warwickshire; the Fosse road from Lincolnshire, which enters the county at Six Hills, and passes by Leicester to Watling Street, the *Via Devana* from Colchester, which enters the county near Melton, and joins the Fosse at Leicester on its way to Chester. The principal Roman stations were *Ratae* (Leicester), *Veromastum* (supposed to have been Borough Hill), *Mandunessum* (Mancetter), and *Bemona* (Highcross). Roman coins, urns, tessellated pavements, military weapons, and domestic utensils and other remains have been found in several places, especially at Leicester, Rothley, Wapley, Eatherby, Bottesford, Hinckley, Sapcote, and Melton Mowbray. Two miles from Leicester a Roman milestone of the time of the emperor Hadrian was discovered in 1771. Under the Heptarchy Leicester was included in the kingdom of Mercia. Afterwards it was overrun by the Danes, from whom it was recovered by Ethelfield. The most noteworthy event connected with the county was the battle of Bosworth Field, where Richard III. was slain 22d August 1485; but it was frequently the scene of contests in the reigns of John and of Henry II and during the Revolution period.

The principal monastic foundations in Leicester were priories of Black Canons at St Mary Friar near Leicester, founded in 1143, and at Brecon founded in 1144, priories of Benedictines at Hinckley in 1173 and of Benedictine nuns at Langley near Brecon in the time of Henry I, a collegiate church at Leicester founded in the reign of William I, a priory of canons of St Augustine at Launde in the reign of Henry I. (Now changed into a mansion), houses of the Knights Hospitallars at Dalby and Heather, a priory of St Austin at Bradley, a preceptory of Knights Templars at Rothley in 1280, a house of Franciscans at Leicester founded by Simon de Montfort, a friary of St Augustine called St Catherine's, also at Leicester, and a convent of canons regular of St Augustine at Kirkby, founded in 1369. The principal old castles are those of Ashby-de-la-Zouch and Kirkby-Muxton.

The principal histories of Leicestershire are those of Nicolson, 1790, 4th edition 1798-1809; Threlby, 1749, and Currie, 1851. See also *Compendious Book of Leicester*, 1692; Watson, *Chambers of Leicester*, 1814; Hall, *Geology of the Leicester Coal-field*, 1860; Aveline, *Geology of part of Leicester*, 1860; Judd, *Geology of part of Leicester*, 1876; Hamilton, *Geology of Leicestershire and Rutland*, 1876. For a full list see see Anderson, *Supplement of the Gazetteer of the United Kingdom*, 1881.

LEICESTER, a municipal and parliamentary borough and market-town of England, and the chief town of the county of Leicester, is situated at the intersection of several railway lines, in a gentle hollow on the river Soar, 97 miles north-north-west of London, and 27 south of Nottingham. The town is well built, the streets are spacious

and regular, and the sanitary and water arrangements are very satisfactory. The most important of the churches are St Martin's, near the site of an old Franciscan convent, restored in 1881 at a cost of £80,000; St Mary's, Early English and Norman, originally built in the 13th century, and restored in 1861 at a cost of £10,000; All Saints, an ancient structure in the Early English style, restored in 1875; St Margaret's, a beautiful and spacious building erected in 1444, Early English and Decorated, recently restored at a cost of £6000; and St Nicholas's, in the Early Norman style. Of the old castle two gateways are still standing, and also a portion of the Norman Hall. The other principal buildings are the old town-hall, formerly the guild-hall of Corpus Christi, the new town-hall erected in 1875, the town museum, the school of art, and the public baths, erected in 1879 at a cost of £11,000. One

Plan of Leicester

of the ornaments of the town is the memorial clock-tower erected in 1868 in honour of Simon de Montfort and three other less known persons connected with the district. In the neighbourhood of the town are the remains of the abbey of Black Canons, founded in 1143. On the site of St Margaret's church was the old Saxon cathedral, and in the adjoining abbey Cardinal Wolsey was buried. Besides Trinity Hospital, founded in 1331 by Henry Plantagenet, earl of Leicester, and Wyggeston's Hospital, founded in 1513, there are a large number of minor charities. There is a fine promenade from the town to the Victoria park and raccourse, in addition to which the Abbey park of 40 acres has lately been opened. The staple trade of Leicester is hosiery, including stockings and all kinds of fancy goods. There are also iron-foundries, and manufactures of boots and shoes, elastic web, and sewing cotton. The population of the municipal and parliamentary borough, 17,005 in 1801, had increased in 1871 to 95,220, and in 1881 to 122,351.

Leicester was an ancient British town, and under the name of *Eborac* or *Eboracorum* an important Roman station. It was also one of the five old Danish boroughs, and until 874 it was an ecclesiastical see. Its charter of incorporation was obtained from King John, and from the 23d of Edward I. it returned two members to parliament. Parliaments were held in the town by Henry V. in 1414 and by Henry VI. in 1426. Richard III., who passed a night in it on his way to the fatal battle of Bosworth, was buried in the Franciscan convent. The town was stormed by Charles I., May 31, 1646, and recovered by Fairfax in the June following. See the *History of Thoresby* (1777), Robinson (1791), and Thompson (1871).

LEICESTER, SIMON DE MONTFORT, EARL OF See MONTFORT.

LEICESTER, ROBERT DUDLEY, EARL OF (c. 1531-1588). This favourite of Queen Elizabeth came of an ambitious family. They were not, indeed, such mere upstarts as their enemies loved to represent them, for Leicester's grandfather—the notorious Edmund Dudley who was one of the chief instruments of Henry VII.'s extortions—was descended from a younger branch of the barons of Dudley. But the love of power was a passion which seems to have increased in them with each succeeding generation, and though the grandfather was beheaded by Henry VIII. for his too devoted services in the preceding reign, the father grew powerful enough in the days of Edward VI. to trouble the succession to the crown. This was that John Dudley, duke of Northumberland, who contrived the marriage of Lady Jane Grey with his own son Guildford Dudley, and involved both her and her husband in a common ruin with himself. Robert Dudley, the subject of this article, was an elder brother of Guildford, and shared at that time in the misfortunes of the whole family. Having taken up arms with them against Queen Mary, he was sent to the Tower, and was actually sentenced to death, but the queen afterwards not only pardoned and restored him to liberty, but appointed him master of the ordnance. On the accession of Elizabeth he was also made master of the horse. He was then, perhaps, about seven and twenty, and was evidently rising rapidly in the queen's favour. A few early ages he had been married to Amy, daughter of Sir John Robsart. The match had been arranged by his father, who was very studious to provide in this way for the future fortunes of his children, and the wedding was graced by the presence of King Edward. But it was not a happy marriage. The lady lived alone at Cumnor Hall in Berkshire, the house of one Anthony Forster, and there in the year 1560 she died under circumstances which certainly aroused some suspicions of foul play. The scandal was the more serious as it was insinuated that Dudley stood so high in the queen's favour that he might reasonably hope to marry her, and that a murder had been deliberately planned to remove an obstacle to his advancement. The point, it must be owned, is not free from obscurity, and recent revelations from the archives of Simancas prove that even before the unhappy lady's death it was said there was a design to poison her. After the event, however, the story was that she had broken her neck by a fall down stairs, and, suspicious as the case may appear, there is much to be said in favour of Dudley's innocence, which cannot be discussed within our limits. Certain it is that he continued to rise in the queen's favour. She made him a Knight of the Garter, and bestowed on him the castle of Kenilworth, the lordship of Denbigh, and other lands of very great value in Warwickshire and in Wales. In September 1564 she created him baron of Denbigh, and immediately afterwards earl of Leicester. In the preceding month, when she visited Cambridge, she at his request addressed the university in Latin. The honours shown him naturally excited jealousy, especially as it was well known that his entertainments still more ambitious hopes, which the queen apparently did not altogether discourage. The earl of Sussex, in opposition to him, strongly favoured a match with the archduke Charles of Austria. The court was divided, and, while arguments were set forth on the one side against the queen's marrying a subject, the other party insisted strongly on the disadvantages of a foreign alliance. The queen, however, was so far from being foolishly in love with him that in 1564 she recommended him as a husband for Mary Queen of Scots. But even this, it was believed, was only a blind, and indeed it may be doubted how far this proposal was serious. After his creation as earl of Leicester great attention was paid to him both at home and abroad. The

university of Oxford made him their chancellor, and Charles IX. of France sent him the order of St Michael. A few years later he formed an ambiguous connexion with the baroness dowager of Sheffield, which was maintained by the lady, with great appearance of truth, to have been a valid marriage, though it was concealed from the queen. Long afterwards, in the days of James I., their son, Sir Robert Dudley, a man of extraordinary talents, sought to establish his legitimacy, but his suit was suddenly brought to a stop, and the documents connected with it sealed up by an order of the Star Chamber, without any reasons being assigned.

In 1575 Queen Elizabeth visited the earl at Kenilworth, where she was entertained for some days with great magnificence. The picturesque account of the event given by Sir Walter Scott has made every one familiar with the general character of the scene. Next year Walter, earl of Essex, with whom Leicester had had some differences, died in Ireland, not without suspicion of poison, and Leicester's subsequent marriage with his widow again gave rise to very serious imputations against him. This marriage, like the former, was kept secret at first; but it was revealed to the queen in 1579 by Simier, an emissary of the duke of Alençon, to whose projected match with Elizabeth the earl seemed to be the principal obstacle. The queen showed great displeasure at the news, and had some thought, it is said, of committing Leicester to the Tower, but was dissuaded from doing so by his rival the earl of Sussex. In February 1582 Leicester, along with a number of other noblemen and gentlemen, escorted the duke of Alençon on his return to Antwerp to be invested with the government of the Low Countries. In 1584 he inaugurated an association for the protection of Queen Elizabeth against conspirators. About this time there issued from the press the famous pamphlet, believed to have been the work of Parsons the Jesuit, entitled *Leicester's Commonwealth*, which was intended to suggest to the people that the English constitution was subverted and the government handed over to one who was at heart an atheist and a traitor, besides being a man of infamous life and morals. The book was ordered to be suppressed by letters from the privy council, in which it was declared that the charges against the earl were to the queen's certain knowledge untrue; nevertheless they produced a very strong impression, and were believed in by some who had no sympathy with Jesuits long after Leicester's death. In 1585 he was appointed commander of an expedition to the Low Countries in aid of the revolted provinces, and sailed with a fleet of fifty ships to Flushing, where he was received with great enthusiasm. In January following he was invested with the government of the provinces, but immediately received a strong reprimand from the queen for taking upon himself a function which she had not authorized. Both he and the States General were obliged to apologize; but the latter protested that they had no intention of giving him absolute control of their affairs, and that it would be extremely dangerous to them to revoke the appointment. Leicester accordingly was allowed to retain his dignity; but the incident was inauspicious, nor did affairs prosper greatly under his management. His nephew Sir Philip Sidney was slain at the unsuccessful siege of Zutphen, and complaints were made by the States General of the conduct of the whole campaign. He returned to England for a time, and went back in 1587, when he made an abortive effort to raise the siege of Silya. Disagreements increasing between him and the States, he was recalled by the queen, from whom, contrary to the expectation of his enemies, he met with a very good reception; and he continued in such favour that in the following summer (the year being that of the Armada,

1588) he was appointed lieutenant-general of the army mustered at Tilbury to resist Spanish invasion. After the crisis was past he was returning homewards from the court to Kenilworth, when he was attacked by a sudden illness and died at his house at Cornbury in Oxfordshire, on the 4th September.

Such are the bare facts of Leicester's life. Of his character it is more difficult to speak with confidence, but some features of it are indisputable. Being in person tall and remarkably handsome, he improved these advantages by a very ingratiating manner. A man of no small ability and still more ambition, he was nevertheless vain, and presumed at times upon his influence with the queen to a degree that brought upon him a sharp rebuff. On the other hand, Elizabeth stood by him, as we have seen, against efforts to supplant him. That she was ever really in love with him, as modern writers have supposed, is extremely questionable; but she saw in him some valuable qualities which marked him as the fitting recipient of high favours. He was a man of princely tastes, especially in architecture. At court he became latterly the leader of the Puritan party, and his letters were pervaded by expressions of religious feeling which it is hard to believe were insincere. Of the darker suspicions against him it is enough to say that much was certainly reported beyond the truth; but there remain some facts sufficiently mysterious to make a just estimate of the man a rather perplexing problem.

(J. G.)

LEIGH, a market and manufacturing town of Lancashire, England, is situated on several branch railway lines, $7\frac{1}{2}$ miles south-west of Bolton. The ancient parish church was, with the exception of the old tower, rebuilt in 1873 in the Perpendicular style, at a cost of over £10,000. The grammar school, the date of whose foundation is unknown, received its principal endowments in 1555, 1562, and 1681. A union workhouse was erected in 1851 at a cost of £10,000. The staple manufactures of the town are silk and cotton, but there are also glass-works, foundries, breweries, and flour-mills, with extensive collieries. The local government board was formed in 1875 by the amalgamation of those previously existing for the townships of West Leigh, Bedford, and Pennington. The population of the district was 17,623 in 1871, and 21,733 in 1881. The town includes also a portion of the township of Atherton.

LEIGH, EDWARD (1602-1671), Puritan linguist and theologian, was born in 1602 at Shawell, Leicestershire, was educated at Magdalen Hall, Oxford, from 1618, and subsequently became a member of the Middle Temple. In 1636 he entered parliament as member for Stafford, and during the civil war he held a colonelcy in the parliamentary army. He has sometimes been confounded with John Ley, and so represented as having sat in the Westminster Assembly. The public career of Leigh terminated with his expulsion from parliament along with the rest of the Presbyterian party in 1648. From an early period in his life he devoted much of his time to the study of theology and to the preparation for the press of numerous compilations, the most important of these being the *Critica Sacra*, containing observations on all the *Radices* of the Hebrew Words of the Old and the Greek of the New Testament (1639-44; new ed., with supplement, 1662), for which the author received the thanks of the Westminster Assembly, to whom it was dedicated. It has frequently been reprinted abroad, and in the opinion of Leigh's contemporary Fuller, it, "with many other worthy works, will make his judicious industry known to posterity." It is now, however, but little used. Leigh died in Staffordshire in June 1671.

His remaining works include *A Treatise of Divinity* (1646-51), *A Bely of Dromsdy* (1654), *Annotations upon the New Testament*

(1656), of which a Latin translation by Arnold was published at Leipzig in 1732. *Annotations on the First Printed Books of the Old Testament* (1657), *A Treatise of Religion and Learning* (1656), *Selected and Choice Observations concerning the First Twelve Chapters* (1655).

LEIGHTON, ROBERT (1611–1684), bishop of Dunblane, and afterwards archbishop of Glasgow, was the eldest son of Dr Alexander Leighton, the author of *Zion's Plea against the Prelacie*, whose terrible sufferings for having dared to question the divine right of Episcopacy, under the persecution of Laud, form one of the most disgraceful incidents of the reign of Charles I. Dr Leighton is said to have been of the old family of Ullishaven in Forfarshire, and his illustrious son was born in the year 1611. From his earliest childhood, according to Burnet, he was distinguished for his sauntly temper and disposition, and in his sixteenth year (1627) he was sent to complete his education at the university of Edinburgh, where, after studying with distinguished success for four years, he took his degree of M.A. in 1631.¹

After leaving college his father sent him to travel abroad, and he is understood to have spent several years in France, where he acquired a complete mastery of the French language. While there he passed a good deal of time with some relations at Douay who had become Roman Catholics, and with whom he would seem to have formed a strict friendship, as he kept up a correspondence with them for many years afterwards. Either at this time or on some subsequent visit to the Continent he had also a good deal of intercourse with some members of the Jansenist party. And no doubt what he then saw among these excellent persons of the piety which was possible even in a communion which he believed to be corrupt contributed not a little to the charity towards those who differed from him in religious opinions, which ever afterwards formed so remarkable a feature in his character. The exact period of his return to Scotland has not been ascertained; but in 1641 he was ordained Presbyterian minister of Newbattle in Midlothian, where he continued for about ten years. At the end of that period he resigned his charge, and went to reside in Edinburgh (1652). What the precise circumstances were which led him to take this step does not distinctly appear. But the account given is that the fiery zeal of his brother clergymen on certain political questions found little sympathy with him, and that this led to severe censures on their part, which were too much for his gentle nature to bear.

Early in the following year (1653) he was appointed principal of the university of Edinburgh, and primarius professor of divinity. In this post he continued for seven or eight years, and, according to Burnet, "he was a great blessing in it, for he talked so to all the youth of any capacity or distinction that it had a great effect on many of them." A considerable number of his Latin prelections and other addresses to the students were published after his death, and are singularly remarkable for the purity and

elegance of their Latinity, and their subdued and meditative eloquence. The reader will be disappointed if he expects to find in them any subtle exposition of a metaphysical system of theology. In this respect they present a curious contrast to any thing that is known of the theology taught at that time in the Presbyterian Church of Scotland. They are rather to be regarded as valuable instructions in the art of living a holy life than as a body of scientific divinity. Throughout, however, they bear the marks of a deeply learned and accomplished mind, fully saturated with both classical and patristic reading, and like all his works they breathe the spirit of one who lived very much above the world. It would be interesting to ascertain how far he succeeded in instilling something of his own spirit into the minds of those who listened to his teaching. We certainly meet with very little indication of its having taken any deep root in the hearts of either the Presbyterians or the Episcopalian clergy of the twenty or thirty years which succeeded the period of his principalship. The only writer of the time who has spoken with true appreciation of his character is Bishop Burnet, both in his *History of his Own Times* and in his *Pastoral Care* he has referred to Leighton in language of unbounded affection and admiration. This, however, was founded upon knowledge of him obtained in the course of a friendship formed after he had demitted his office of principal, and not upon his university teaching.

In 1661, when Charles II. had resolved to force Episcopacy once more upon Scotland, he fixed upon Leighton for one of his bishops. Looking at the matter, as we are apt to do, in the light of what followed in the history of Scotland during the next twenty-seven years, it seems almost unaccountable how such a man as Leighton could have submitted as he did to the degradation of being associated with condutors like Sharp and some of his companion bishops. The only explanations which can be given perhaps are that Leighton, living very much out of the world, and being somewhat deficient in what may be called the political sense, had no idea of the deadly hatred entertained toward Episcopacy by the great mass of the religious people of Scotland, and so of its utter unfitness to become the established church polity of the country, and that his soft and gentle nature rendered him too open to the persuasions which were used to induce him to enter a sphere for which he instinctively felt he was ill qualified. Every one will give him credit too for having no conception that the only object of the Government in establishing Episcopacy in Scotland was to make it subservient to despotism and persecution. The Episcopacy which he contemplated was that modified form which had been suggested by Archbishop Usher, and to which Baxter and many of the best of the English Nonconformists would have readily given their adherence. It is significant on this head that he always refused to be addressed as "my lord," and it is stated that when dining with his clergymen on one occasion he was so far from arrogating any right of superiority or precedence that he wished to seat himself at the foot of the table.²

If Leighton did not know before, he soon began to discover the sort of men with whom he was to be associated in the episcopate. He travelled with them in the same coach from London towards Scotland, but having become, as he told Burnet, very weary of their company (as he doubted not they were of his), and having found that they intended to make a kind of triumphal entrance into Edinburgh, he left them at Morpeth and retired to the earl of

¹ One has difficulty in thinking of even the youthful Leighton as capable of humour or sarcasm. But it so happens that the only anecdote of his college career which has been preserved to us indicates the presence of some trace of these in his character. The provost of Edinburgh at the time was a certain David Aikenhead, who had probably made himself offensive in some way to the young colleagues, and Leighton, it appears, was tempted to perpetrate the following little epigram upon him:—

"That quibble his name friends in falsely said,
To wit that of one whose his head is made,
For it that had been compassed on,
His byre nose had stained his long space."

To "blaspheme the bullies" (much more the provost) was at that time a somewhat serious offence, and we are told that he was "extruded" from the college for his attack upon the provost's nose. It would seem, however, that the offence was speedily condoned, as he is found soon afterwards to have been restored to his position.

² For an interesting and characteristic indication of the purity of his motives in accepting a bishopric, reference may be made to his letter to the earl of Lothian, dated December 28, 1661, which is still preserved among the Lothian papers.

it is capable of in the heart of man. It was a common reproach against Leighton, as we have seen, that he had leanings towards Roman Catholicism, and perhaps this is so far true that he had formed himself in some degree upon the model of some of those saintly persons of that faith, such as Pascal and Thomas à Kempis, who had entered the spiritual life to more ethereal heights than appear to be as yet attained within the lines of Protestantism.

Editorial—It is matter of regret that no perfectly satisfactory edition of Leighton's works has as yet appeared. After his death his *Commentary on Peter* and several of his other works were published under the editorship of his friend Dr Fall, and on the whole these only editions may be said to be with some drawbacks, by far the best. All his later editors have unfortunately been possessed by the tasteless mania of reducing his good antique and nervous language to the bald feebleness of modern phraseology, dealing with him like literary matrons correcting a schoolboy's themes. It is unfortunately impossible to exempt from this custom even the edition, in other respects very valuable and meritorious, lately published under the superintendence of the Rev W West (London, 1875). (J T BR)

LEIGHTON-BUZZARD, a market-town of Bedfordshire, is situated on the river Ouse, which there divides Bedford from Bucks, and on the North-Western Railway, 40 miles north of London. The town, which is generally well built, contains a spacious market-place, and of late great improvement has taken place in the appearance of the shops. The church of All Saints, in the Early English style of architecture, possesses a tower and spire 193 feet in height. In the market-place are the town-hall, rebuilt in 1852, and containing portions of a very ancient structure, the coin exchange erected in 1863, and the fine old market cross, in the Perpendicular style, erected in 1330. National school premises were built in 1872. There are also several charities. The manufacture of straw plait gives employment to a considerable number of females, but the town is chiefly dependent on agriculture. The population of the registration sub-district in 1871 was 9942, and in 1881 it was 10,384.

Some identify Leighton-Buzzard with the *Lyppanburgh* mentioned in the Saxon Chronicle as having been taken in 871 by Canulf, brother of Cædric, king of Wessex. The addition *Buzzard* has been conjectured to be a corruption of *Zawodort*, but others also derive it from *Bozzard* or *Borot*, the name of an ancient family, one of whom was knight of the shire in the time of Edward III.

LEINSTER See **IRELAND**.

LEIPZIG (in German, *Leipzig*), the second town of the kingdom of Saxony in size, and the first in commercial importance, is situated in a large and fertile plain, in 51° 20' 6" N. lat and 12° 23' 37" E. long., about 65 miles north-west of Dresden and 6 miles from the Prussian frontier. It stands just above the junction of three small rivers, the Pleisse, the Parthe, and the Elster, which flow in various branches through or round the town, and afterwards, under the name of Elster, discharge themselves into the Saale. Though of unimposing exterior, Leipzig is one of the most prosperous and enterprising of German towns. Besides being the most important commercial city in Germany next to Hamburg, it possesses the second largest German university, is the headquarters of the supreme courts of the empire, and forms one of the most prominent literary and musical centres in Europe. It consists of the old or inner city, surrounded by a wide and pleasant promenade laid out on the site of the old fortifications, and of the very much more extensive inner and outer suburbs. Beyond the last is a fringe of thriving suburban villages, such as Raudnitz, Volkmarndorf, Gohlis, Eutritzsch, Plagwitz, and Lindenau, which are gradually becoming absorbed by the growth of the town. On the north-west the town is bordered by the fine public park and woods of the Rosenthal.

The old town, with its narrow streets and numerous houses of the 16th and 17th centuries, still preserves much of its quaint medieval aspect. The most interesting of its buildings are the Rathaus, a Gothic edifice

built by Hieronymus Lotter in 1556 (now doomed to demolition), and the Fürstenthum, with its curious projecting balconies. The Pleissenburg, or citadel, now used for barracks and public offices, also dates from the middle of the 16th century. Anerbach's Keller, a curious old wine-vault, is interesting for the use made of it by Goethe in his *Faust*; it contains a series of mural paintings of the 16th century, representing the legend on which the play is based. The business of Leipzig is chiefly concentrated in the inner city, but the headquarters of the book trade lie in the east suburb. The streets of the suburbs are mostly broad and well built. The most notable modern buildings are the new theatre, an imposing Renaissance structure designed by Langhans, and the museum, which stand facing each other at opposite ends of the spacious Augustus-Platz. Most of the west side of the same square

Plan of Leipzig

is occupied by the Augusteum, or main building of the university, which, however, also possesses several special institutes in another part of the town. The new district law courts are contained in a large and substantial though not specially imposing building, and the municipal hospital and the hospital of St John are also handsome edifices. The so-called Roman House, with loggias and frescoes in the Italian style, is the only private dwelling demanding remark. The churches of Leipzig are comparatively uninteresting. The oldest, in its present form, is the Paulinerkirche or university church, built in 1229-40, and the largest is the Thomaskirche, dating from 1496. The university of Leipzig, founded in 1409 by a secession of two thousand German students from Prague, has long ranked among the most important in Germany. A few years ago it was also the most numerously attended, but it is now outstripped by Berlin, which has about four thousand students as compared with thirty five hundred at Leipzig (1882). The professors and "Privatdozenten," or lecturers, number about one hundred and seventy. The university library contains 350,000 volumes and 4000 manuscripts; it occupies the Paulinum, a characteristic specimen of old monastic architecture, dating in part from

1229-1240. The other educational institutions of Leipzig include three gymnasia, two "Realschulen," a commercial academy (*Handelschule*), a high school for girls, another for boys, and a large number of admirable public and private schools of a lower grade.

The number of literary, scientific, and artistic institutions in Leipzig is unusually large for the size of the town. One of the most important is the museum, which contains about four hundred modern paintings, a large number of casts, a few pieces of original sculpture, and a well-arranged collection of drawings and engravings. The art-industrial museum, the collection of the historical society, and the ethnographical museum are also of considerable interest, and will be still more useful when they are united in the large building to be erected for them with part of the munificent bequest made to the town by Herr Grassi in 1881. As a musical centre Leipzig is known all over the world for its excellent conservatorium, founded in 1843 by Mendelssohn-Bartholdy. The series of concerts given annually in the old Gewandhaus, or Drapers' Hall, as also of world-wide reputation, and the operatic stage of Leipzig is deservedly ranked among the finest in Germany. A further stimulus to the musical taste of the inhabitants is afforded by the numerous vocal and orchestral societies, some of which have brought their art to a very high pitch of perfection. The prominence of the publishing interest (more fully noticed below) has attracted to Leipzig a large number of gifted authors, and made it a literary centre of considerable importance. About two hundred and seventy newspapers and periodicals are published here, including several of the most widely circulated in Germany.

The outstanding importance of Leipzig as a commercial town is mainly derived from its three great fairs, which annually attract a concourse of about forty thousand merchants from all parts of Europe, and from Persia, Armenia, and other Asiatic countries. The most important fairs are held at Easter and Michaelmas, and are said to have been founded as markets about 1170. The smaller New Year's fair was established in 1458. In 1268 Margrave Dietrich granted a safe-conduct to all frequenters of the fairs, and in 1497 and 1507 the emperor Maximilian greatly increased their importance by prohibiting the holding of annual markets at any town within a wide radius of Leipzig. During the Thirty Years' War, the Seven Years' War, and the troubles consequent upon the French Revolution, the trade of the Leipzig fairs considerably decreased, but it recovered itself after the accession of Saxony to the German Customs Union (*Zollverein*) in 1833, and for the next twenty years rapidly and steadily increased. Since then, owing to the greater facilities of communication and consequent alterations in the mode of conducting business, the transactions at the fairs may be said to have diminished in relative though they have increased in actual value. Wares that can be safely purchased by sample appear at the fairs in steadily diminishing quantities, while others, such as hides, furs, and leather, which require to be actually examined, show as marked an increase. It is impossible to give accurate statistics of the business done at the fair, but the value of the sales considerably exceeds £10,000,000 sterling per annum. The principal commodity is furs (chiefly American and Russian), of which about one and a quarter million pounds worth are annually disposed of; next in order come leather, hides, wool, cloth, linen, and glass. The Leipzig wool-market, held for two days in June, is also important.

In the trades of bookselling and publishing Leipzig occupies a unique position, not only taking the first place in Germany, but even surpassing London and Paris in the number and total value of its sales (*Hasse, Leipzig und ihre Umgebung*, p. 236). There are upwards of three hundred

publishers and booksellers in the town, and about five thousand firms in other parts of Europe are represented here by commissionaires. About 2500 books, or one-sixth of the total production of Germany, are published in Leipzig annually. Several hundred booksellers assemble in Leipzig every year at Jubilate, and settle their accounts at their own exchange (*Buchhändler-Börse*). Leipzig also contains seventy printing-works, some of great extent, and a corresponding number of type-foundries, bindings-shops, and other kindred industries. The so-called "polygraphic" industries give employment to nearly ten thousand hands.

As a manufacturing town Leipzig is important rather for the variety than for the magnitude of its industries. The great manufacturing staples, such as iron and the textile fabrics, are scarcely represented at all, but in certain specialties, such as etheric oils, artificial flowers, and perfumes, it ranks before any other town in Germany. In absolute value the most important articles of manufacture are pianos and other musical instruments, tobacco and cigars, spirits, chemicals, scientific instruments, and waxcloth. Wool-combing has also of late years been extensively carried on. Upwards of fifty thousand workpeople are employed in the factories in and around Leipzig.

The population of Leipzig has been quantified within the present century, rising from 31,337 in 1801 to 163,688 in 1881, and has of late increased at the rate of between 3 and 4 per cent. per annum. With the suburban villages the population amounts to 220,000. While the dwelling-houses in the suburbs have been multiplied sixfold in the last two hundred years, the number in the inner town has remained almost stationary for the same period, the business part of Leipzig thus exhibiting the same phenomenon as in other large cities. The vast majority of the population (upwards of 90 per cent.) belongs to the Lutheran Church, while the religious bodies next in numerical order are the Roman Catholics (4268), the Reformed (3958), and the Jews (3176). The annual death-rate is 28 to 24 per 1000, in which Leipzig, thanks in part to its excellent system of drainage, compares favourably with other German towns. It is remarkable that the proportion of suicides to population is larger in Leipzig than in any other European town. In the five years 1876-80 no fewer than 332 persons voluntarily put an end to their lives, being at the rate of 62 per annum, or 1 suicide to every 80 deaths of adults.

History.—Though recent discoveries point to the conclusion that the site of Leipzig was inhabited even during the Stone Age, the history of the present town begins with the foundation of a Saxon fishing village at the junction of the Pleisse and the Parthe, which derived its name of *Lipik* from the Slavonic *lip* or *lipo*, a lime-tree. This settlement was probably already in existence when the emperor Henry I. built a castle here about 930. The Slavonic language long continued to be spoken in Leipzig, and was legal in the courts of law down to 1327. The first historical mention of Leipzig occurs in a writ of the beginning of the 11th century, when it is spoken of as an "urbs," or fortified place. In 1134 it came into the possession of Conrad of Wettin, margrave of Meissen, and under Margrave Otto the Rich (1156-86) it received many important privileges, and became a flourishing town of 5000 to 6000 inhabitants. Its favourable situation, almost equidistant from the Baltic Sea and the Alps, the Rhine and the Oder, in this midst of a fertile plain intersected by the principal highways of central Europe from north to south and east to west, co-operated with the fostering care of the margaves in raising it in the 15th century to the position of one of the most important commercial towns in Germany. The growth of its fairs, which of course were mainly instrumental in producing this result, has been above described. The famous conference between Luther and Dr. Eck, held in the Leipzig Pleisensburg in 1519, did much for the spread of the Reformation, but it was not till twenty years later that Luther formally espoused the Protestant cause. In 1547, in the war of the Smalkaldean League, the town was besieged and the suburbs reduced to ashes, and during the Thirty Years' War it suffered six sieges and was four times occupied by hostile troops. Its commerce was also greatly interrupted by the Seven Years' War. The publishing trade of Leipzig began to grow important towards the end of the 17th century, when the severity of the censorship at Frankfurt-on-the-Main caused many of its booksellers to emigrate to Leipzig. The preliminary years of the French Revolutionary war were not unfavourable to the commerce of Leipzig, but in 1813 and 1814 the town suffered greatly. Its accession to the Zollverein in 1833 and the establishment of the German system of railways (of which Leipzig is an important centre) inaugurated a period of great prosperity, which has continued to the

present day. The revolutionary riots of 1848-49 and the Prussian occupation in 1866-67 were merely passing shadows. In 1870 Leipzig acquired a new importance by becoming the seat of the supreme courts of the German empire.

The immediate neighbourhood of Leipzig has been the scene of numerous battles, two of which are of more than ordinary importance, viz. the battle of Breitenfeld in 1631 (vol. xi. p. 334), and the great battle of Leipzig, known in Germany as the *Völkerschlacht*, fought in 1813 between Napoleon and the allied forces of Russia, Germany, and Austria.

Towards the middle of last century Leipzig was the seat of the most influential body of literary men in Germany, even when Goethe and Schiller (q.v.) like his contemporary Samuel Johnson in England, exercised a kind of literary dictatorship. Then, if ever, Leipzig deserved the epithet of a "Paris in miniature" (*Klein-Paris*), assigned to it by Goethe in his *Feust*. The young Lessing produced his first play in the Leipzig theatre, and the university count Goethe, Klopstock, Jean Paul Richter, the Schlegels, Fichte, Schelling, and numerous other eminent writers and thinkers among its quondam alumni. Schiller also resided for a time in Leipzig, and Sebastian Bach, Hiller, and Mendelssohn all filled musical posts there. Among the famous natives of the town are the philosopher Leibnitz and the composer Wagner.

See the *Erkenntnis des Stadt Leipzig*, 1870 v. G. Grosse, *Geschichte des Stadt Leipzig*, 1887-88, *Stadtfeld, Chronik der Stadt Leipzig*, 2d ed. 1891, *Geschichte der Universität Leipzig*, 1891. Also, *Leipziger Handel und Gewerbe*, 1860, *Fluss der Stadt Leipzig und ihre Umgebungen*, 1860, and *Leipziger Nachrichten*, 1878, the *Mittheilungen* of the Historical Bureau of Leipzig, and the *Abhandlungen* of the Leipzig Historical Society.

LEITH, a municipal and parliamentary burgh of Midlothian, the chief seaport of the east coast of Scotland, 1½ miles north by east of Edinburgh, with which it is connected by Leith Walk and other lines of street. It is built on the southern shore of the Firth of Forth, at the mouth of the Water of Leith, which, crossed by seven bridges,

Plan of Leith

divides it into North and South Leith. Stretching along the coast for about 3½ miles from Seaford on the east to Granton on the west, the burgh includes the fishing village of Newhaven, the suburb of Trinity, and part of Wardie, and extends to an area of 1978 acres. It figures as Inverleith ("mouth of the Leith") in the foundation charter of Holyrood Abbey (1128); and many of its houses, in narrow wynds and along the eastern water-side, have an

antique and decayed appearance. The earliest date on any is 1573, but one, at the Coalhill, is thought to be the "handsome and spacious edifice" built for her privy council by the queen regent, Mary of Guise. Nothing remains of D'Essé's fortifications (1549) or of Cromwell's "fair citadel" (1650), but it was Cromwell's troops that razed the battery mounds upon the Links, a grassy expanse of 1140 by 400 yards, bought for a public park in 1857. Leith Fort, the headquarters of the royal artillery in Scotland, dates from 1779, the quaint old Tolbooth, where Maitland of Lethington poisoned himself (1573), was demolished in 1819, and the public buildings one and all are modern, most of them classical structures. They comprise the town hall (1828), the custom-house (1812), Trinity house (1817), with David Scott's Vasco da Gama and other paintings, the exchange buildings, the corn exchange (1862), the markets (1818), the slaughter-house (1862), the post-office (1876), the public institute (1867), the poor-house (1862), the hospital (1872-76), John Watt's hospital (1862), the high school (1806), and Dr Bell's school (1839). In December 1881 eight board schools had 4839 children on the roll, and an average attendance of 3932.

Of twenty-seven churches, belonging to nine different denominations, the only ancient one is that of South Leith parish, which, founded in 1483, and dedicated to St Mary, was originally cruciform, but now, as "restored" in 1852, consists of merely an aisled nave and square north-western tower. David Lindsay preached in it before James VI. a thanksgiving sermon on the Gowrie conspiracy (1600), and in its graveyard lies the Rev. John Home (1722-1808), author of *Douglas*, and a native of Leith. Other places of worship are North Leith parish church (1814-16), with Grecian spire of 158 feet, North Leith Free church (1859), in Germanized Gothic, with spire of 160 feet; and St James's Episcopal church (1862-69), a cruciform structure, designed in Early English style by the late Sir G. G. Scott, with apsidal chancel, a spire of 160 feet, and a peal of bells.

So early as 1313 Leith possessed its ships, they in that year being burnt by the English. But in a wide flat foreshore and drifting sands the port has had great difficulties to contend with, and Tucker in 1656 describes it merely as "a convenient dry harbour into which the fifth ebbs and flows every tide, with a convenient quay on the one side thereof, of a good length for lading of goods." The earliest dock was commenced in 1720, and the custom-house quay constructed in 1777; but little of the existing works is older than the present century. These, with date, cost, and area, comprise the Old docks (1801-17: £285,108; 10½ acres), the Victoria dock (1852: £135,000; 5 acres), the Albert dock (1868-69: £224,500, 10½ acres), and the Edinburgh dock (1874-81: £400,000, 10½ acres); in connexion with the last two 62 and 108 acres were reclaimed from the east sands. The largest of seven graving docks, the Prince of Wales dock (1858), measures 370 by 60 feet, and cost £100,000; the east and west piers, extended or formed during 1826-52, and respectively 3530 and 3123 feet long, leave an entrance to the harbour 280 feet broad, with a depth at high water of 20 to 25 feet. The aggregate tonnage registered as belonging to the port was 1702 in 1692, 6935 in 1752, 25,427 in 1844, 28,303 (3946 steam) in 1854, 33,303 in 1860, 44,892 in 1867, 65,692 in 1873, 74,713 in 1878, and 86,509 on 31st December 1881, viz. 64 sailing vessels of 16,371 tons, and 125 steam-vessels of 70,138 tons, the largest of the latter being one of 2144 tons. This shows marked progress, as likewise does the following table, giving the aggregate tonnage of British and foreign vessels that entered and cleared from and to foreign ports and coast-

wise, in cargoes and ballast, during the years ending 15th May:—

Year	Entered			Cleared		
	Sailing	Steam	Total.	Sailing	Steam	Total.
1854			309,498			304,022
1857	235,065	321,035	556,100	97,969	304,806	402,775
1860	304,301	534,479	838,880	291,344	536,458	827,797
1870	309,751	652,694	962,475	312,621	654,427	967,048
1878	320,348	695,258	1,015,606	265,062	598,751	863,813
1880	261,407	678,771	940,178	269,927	631,803	901,730
1881	262,871	711,582	974,453	259,143	712,056	971,199

Of 8838 vessels of 552,580 tons that entered in the twelvemonth ending 31st December 1880, 851 of 215,268 tons were foreign, 464 of 51,514 tons were in ballast, and 2341 of 843,005 tons were coasters; whilst of 3786 of 935,007 tons that cleared in the same year, 837 of 212,550 tons were foreign, 1093 of 235,655 tons were in ballast, and 2611 of 471,055 tons were coasters. The total value of foreign and colonial imports was £7,887,066 in 1876, £9,777,370 in 1877, £8,614,869 in 1878, £7,361,548 in 1879, and £9,475,080 in 1880. The total value of exports again was £3,145,820 in 1876, £2,861,992 in 1877, £3,804,919 in 1878, £3,086,780 in 1879, and £3,612,111 in 1880. Lastly, the customs revenue has fluctuated between £207,264 in 1867 and £280,570 in 1880,—the amount for the year ended March 31, 1882, being £498,018, and the port's revenue and expenditure amounted to £1,990,509 and £1,953,947 from July 1880 to May 1876, and to £255,582 and £266,306 from 15th May 1876 to 15th May 1881.

In 1511 James IV. here "buildit the 'Michael,' ane verrie monstrous great ship, whilk tuk as meikle timber that aches waited all the woods in Fife, except Falkland wood, besides the timber that can be cut in the Firth of Forth. It was a ship of 2000 tons, and was the first of a new class of ships. During the six years 1875-80 10 sailing vessels of 982 tons and 34 steam-vessels of 11,217 tons were built at Leith, of which those built in 1880 were all steamships—11 of 8555 tons being of iron, and 5 of 191 tons of wood. Glass-making dates from 1689, sugar-refining from 1757, rope-preserving, 1759, and other manufactures are flour-grinding, canvas-weaving, soap-boling, rope-making, engineering, tanning, and the manufacture of artificial manure. Leith is an important centre of trade in grain, timber, and wool, and in wine from Spain, Portugal, and France. It is also head of one of the twenty-five factory districts of Scotland. Granted to the city of Edinburgh in 1829, it first became an independent parliamentary and municipal burgh in 1832-33, with Portobello and Musselburgh returning one member to parliament, and being governed by a provost, four bailies, a treasurer, and ten councillors. The annual value of real property amounted in 1852 to £266,895, against £150,042 in 1850, and £252,819 in 1878. Population (1811) 80,383, (1841) 26,808, (1851) 80,910, (1861) 80,628, (1871) 44,277, (1881) 58,193.

The history of Leith is closely connected with that of Edinburgh, episodes being the burning of its shipping by the English in 1513 and 1510, its sack by them in 1544 and 1647, its seizure by Mary of Guise as stronghold of the Catholic party from 1548 to 1560 and unsuccessful siege in the latter year by the Scotch and English allies, the sailing from it of the first Danish expedition in 1698, and the seizure of its arsenal by Brigadier Mackintosh of Portmarnock and 1800 Highland Jacobites in 1719, to which may be added the arrival, departure, or visit of James II. (1437), Mary Queen of Scots (1561), James VI. and his queen Anne of Denmark (1590), Charles I., who is said to have first got tidings of the Irish rebellion (1641) when playing golf upon the Links, Cromwell and Charles II. (1650), George IV. (1822), Queen Victoria (1842), the King of Denmark (1874), and the duke of Edinburgh (1881).

See A. Campbell's *History of Leith* (Leith, 1827). (F. H. G.)

LEITMERITZ (Boh., *Litoměřice*), an episcopal see and chief town of Leitmeritz district, Bohemia, is situated on the right bank of the Elbe, crossed there by an iron bridge 1700 feet in length, and on the Austrian North-Western Railway, about 35 miles north-north-west of Prague, in 50° 33' N. lat., 14° 10' E. long. Leitmeritz is the seat of the judicial, fiscal, and military authorities for the district, and has a fine cathedral (founded 1057) and several other Roman Catholic churches and ecclesiastical establishments, also a training institute for teachers, classical, mercantile, and industrial schools, two hospitals, and an old-fashioned town-hall dating from the 16th century. The town is noted for its breweries, producing, according to the latest returns, 1,056,420 gallons of beer

annually; it also possesses glass-works, tile-kilns, potteries, and metallic ware factories. The principal agricultural products of the surrounding country, which on account of its fertility has been called the "Bohemian Paradise," are corn, fruit, hops, and wine. Population in 1880, 10,854.

At a very early date Leitmeritz enjoyed special privileges, which were extended and confirmed in 1825 by King John of Luxemburg. In 1421 the town was ineffectually besieged by Ziska. Royal diets were held there in 1494 and 1547, but subsequently the commune was deprived of several of its ancient rights, and its importance declined. In 1631, during the Thirty Years' War, Leitmeritz was captured and forcibly occupied by Saxon troops, who were, however, obliged to relinquish it in 1632 to the imperialists. In 1639 it was taken by the Swedes, who did irretrievable damage to the town. In 1742 the suburbs were burnt by the French.

LEITRIM, a maritime county of Ireland in the province of Connaught, is bounded on the N.W. by Donegal Bay, N.E. by Fermanagh, E. by Cavan, S.E. by Longford, and S.W. by Roscommon and Sligo. Its shape resembles that of an hour-glass. From about 20 miles at the extremities it narrows in the centre to a breadth of only 7 miles, and its greatest length from south-east to north-west is 52 miles. The total area is 376,212 acres, or about 588 square miles.

The northern portion of the county consists of an elevated tableland, of which the highest summits are Luganquilla 1485 feet; Benbo, 1365; and Lacka, 1315. In the southern part the country is comparatively level, and is generally richly wooded. The extent of coast-line is only about 3 miles. The principal river is the Shannon, which, issuing from Lough Allen, forms the south-western boundary of the county with Roscommon. The Bonnet rises in the north-west and flows to Lough Gill, and the streams of Bundrows and Bunduff separate Leitrim from Donegal and Sligo. Besides Lough Allen, which has an area of 8900 acres, the other principal lakes in the county are Lough Macnean, Lough Saur, Lough Gill, and Lough Melvin. A canal from Carrick-on-Shannon passes through the county to Lough Erne.

Geology and Minerals.—The central part of the county round Lough Allen is included in the Connaught coal-field, which both north and south is bounded by carboniferous limestone interspersed with millstone grit and Yoredale beds. In the southern districts there is a considerable extent of bog resting on marl or blue clay. The coal-fields consist of a series of eminences ranging from 1000 to 1377 feet, the most important beds being those to the west of Lough Allen near the Arigna. Only the lower measures remain, and they contain marine fossils. The coal is bituminous, and is well suited for manufacturing purposes; but it is not extensively wrought. In the Yoredale series of the Coal-measures clay ironstone of a very rich quality is found, and was formerly smelted at the Arigna iron-works on Lough Allen. Lead has been found near Lurganboy, and copper in Benbo mountain. Manganese is obtained in considerable quantities, and also yellow ochre and various kinds of clays and chalks. The most important sulphureous spring is that of Drumana; and the chalybeate springs of Cavan on the borders of the county, and of Oakfield adjoining the sea-coast, are also much visited.

Climate and Agriculture.—The climate is very moist and unsuitable for grain crops. On the higher districts the soil is stiff and cold, and, though abounding in stones, very retentive of moisture, but in the valleys there are some very fertile districts resting upon limestone. In the higher regions the chief implement of culture is the spade. Lime, marl, and similar manures are abundant, and on the coast seaweed is plentiful. The total number of holdings in 1880 was 14,812, of which only 624 were less than one acre. More than two-thirds of the holdings are included

in those between 5 and 15 acres and between 15 and 30 acres, which numbered respectively 5439 and 5350. The following table shows the number of acres under the various crops in 1855 and 1881:—

	Wheat	Oats	Other Cereals	Peas	Turnips	Other Crops	Flax	Total under Crops	Manure	Grass	Total
1855	281	28,750	687	23,237	1,078	1,183	719	55,161	26,890	66,770	
1881	338	12,748	108	19,310	942	1,239	177	36,313	40,888	82,583	

The acreage under peas is thus less than one-fourth of the whole area. In 1880 there were 212,374 acres under pasture, and 78,330 waste. The number of horses in 1881 was 3983, of which 2627 were used for agricultural purposes. Between 1855 and 1881 cattle diminished from 91,061 to 84,814. The number of milch cows in the latter year was 35,732, the production of butter being one of the principal industries of the small farmer. Sheep diminished from 20,878 in 1855 to 11,347 in 1881, and pigs from 20,790 to 19,302. Poultry 1881 numbered 81,920.

According to the corrected return of 1878 the land was divided among 451 owners possessing 371,371 acres, with a total annual valuation of £135,946. Of the owners about 70 per cent. possessed more than one acre, and the average value per acre was 7s. 3d. The average size of the estates is 823 acres; and the largest owners are Lord Massy, 24,751; Earl of Leitrim, 25,038; George Lane Fox, 18,850; Owen Wynne, 15,436; and Arthur L. Tottenham, 14,561.

Manufactures.—These are confined chiefly to coarse linen for domestic purposes, but coarse pottery is also made. In 1880 there were three scutching mills in the county, all driven by water.

Railways.—The Longford and Sligo branch of the Midland Great Western Railway passes through the southern part of the county, and in the northern part there is a branch between Sligo and Bundoran.

Administration and Population.—The county is divided into 5 baronies, and contains 17 parishes, with 1489 townlands. It is within the Connaught circuit, and seizures are held at Carrick-on-Shannon, and quarter sessions at Ballinamore, Carrick-on-Shannon, and Manorhamilton. There are two poor-law unions in the county and portions of other three. The county is within the Dublin military district, and there are barracks at Carrick-on-Shannon. It is in the diocese of Kilmore and Ardagh. In the Irish House of Commons two members were returned for the county and two for the boroughs of Carrick-on-Shannon and Jamestown, but at the union the boroughs were disfranchised. In 1780 the population was 26,149, which in 1821 had increased to 124,785 and in 1841 to 156,309, but in 1861 had diminished to 104,744, in 1871 to 95,562, and in 1881 to 89,795, of whom 44,777 were males and 45,018 were females. The total number of emigrants from the county between 1st May 1851 and 31st December 1880 was 43,186, a percentage of 41·2 to the population in 1861. In 1880 the rate of marriages per 1000 of estimated population was 2·6, of births 22·4, and of deaths 15·9. The population is almost entirely rural, the only town being Carrick-on-Shannon, with a population in 1871 of 1442.

History and Antiquities.—Anciently the entire county bordering on Lough Erne, including Fermanagh and Cavan, was, according to Ptolemy, occupied by the Eboraci. Afterwards, along with Cavan, Leitrim formed part of the territory of Breffny or Brenny, which was divided into two parishes, of which Leitrim under the name of Hy Brein-Breiffny or Brenny formed the western. From the fact that for a long time it was possessed by the O'Rourke descendants of Roderick, king of Ireland, it was also called Breffny O'Rourke. In the 12th century Thomas O'Rourke was expelled from the government by the princes of Leinster and Connaught, but he was afterwards reinstated by Turlogh, king of Ireland,

and, although after the arrival of the English it was united to Roscommon, the O'Rourkes remained practically independent in the reign of Elizabeth. Large consecrations took place in the reigns of Elizabeth and James I., in the Cromwellian period, and after the Revolution of 1688-89.

"There was a 'drumshill' remains near Fenagh and at Letterfyan, and important monastic ruins at Creevelea near the Bonnet, with several antiquary monuments, and at Frysall in the parish of Fenagh. There was an important Franciscan friary at Jamestown. The abbey of Mohill, Annaduff, and Drumlish have been converted into parish churches. Among the more notable old castles are O'Rourke's Hall at Drumlish, now in ruins, Manorhamilton Castle, originally very extensive, but now also in ruins, and Castle John on an island in Lough Seun.

LELAND, LEYLAND, or LAYLONDE, JOHN (c. 1606-1652), a famous English antiquary, was born in London towards the close of the reign of Henry VII. From St Paul's School, where he was brought up under Laly, the famous grammarian, he passed to Christ's College, Cambridge, and thence to All Soul's College, Oxford. After residing for some time in Paris, he returned to England, and became chaplain to Henry VIII., who appointed him, in 1530, to the rectory of Popeling in the marches of Calais, made him his librarian, and in 1533 commissioned him as "king's antiquary," with power to search for records, manuscripts, and relics of antiquity, in all the cathedrals, colleges, abbeys, and priories of England. Accordingly he set out on a tour which lasted six years, and afforded him materials for study during the remainder of his life. On his return in 1542 he was rewarded by the king with the rectory of Haseley in Oxfordshire; in 1543 he became a canon of King's College (now Christ Church), Oxford, and about the same time a prebendary of Salisbury. Leland now withdrew to his house in the parish of St Michael le Querne, London, and devoted himself exclusively to the digesting of his information. In 1647 he fell into a state of insanity, which continued until his death on the 18th April 1652.

Some of Leland's papers, after passing through several hands, were deposited by Burton, the historian of Leicestershire, in the Bodleian Library at Oxford in 1832. Others came into the possession of Sir Robert Cotton, and are now, along with the rest of his books, in the British Museum. His principal works are *The Itinerary Journey and Search for English Antiquities; A New Years Gifte to Kings Henry the VIII. on the 87 years of his Reign*, London, 1549; *Commentarii de Scriptoribus Britannicis*, edited by Anthony Hall, Oxford, 1758, 2 vols. 8vo; *The Itinerary*, published by Thomas Hearne, Oxford, 1710-12, 9 vols. 8vo, and reprinted in 1770; and *De Rebus Britannicis Collectanea*, edited by Hearne, Oxf., 1718, 6 vols. 8vo, and reprinted at London in 1770. See *The Lives of those eminent antiquaries John Leland, Thomas Hearne, and Anthony a Wood*, vol. I., Oxford, 1772.

LELAND, JOHN (1691-1766), a polemical theologian of the 18th century, was born at Wigan, Lancashire, in 1691, and was educated in Dublin, where he made such progress in theological and other studies that in 1716, without having attended any college or hall, he was appointed first assistant and afterwards sole pastor of a congregation of Presbyterians in New Row. This office he continued to fill until his death on January 16, 1766.

Leland's first publication was *A Defence of Christianity* (1738), in reply to Tindal's *Christianity as Old as the Creation*, it was succeeded by his *Divine Authority of the Old and New Testaments asserted* (1738), in answer to *The Moral Philosopher of Morgan*; in 1741 he published two volumes, in the form of two letters, being *Remarks on [H. Dodwell's] Christianity not Founded on Arguments*; and in 1758 *Reflections on the Late Lord Bolingbroke's Letters on the Study and Use of History*. *A View of the Principal Intellectual Writers that have appeared in England* was published in 1754-55. This is the only work of the author—"most worthy, painstaking, and commonplace of devices," as he has recently been styled—which can now be said to have any present value. This value, however, is purely historical; his facts about the details are interesting and useful, but it may be safely conjectured that no one now reads his (doubtless sincere) arguments, here and elsewhere, against the creed he opposed without some sense of their hollowness, contradictoriness, and obvious unfairness. His latest work was a treatise entitled *The Advantage and Necessity of the Christian Revolution*.

shown from the State of Religion in the Ancient Eastern World. Discourses on various Subjects, with a Life prefixed, was published posthumously, 4 vols 8vo, 1768-69, also a Life by Hindeford, 1772.

LELEGES was the name applied to an early race or set of races around the Aegean Archipelago. The name occurs in Leucadia, Acaenia, Aetolia, Phocis, Locria, Boeotia, Megara, Laconia, Elis, the islands of the Aegean, the Troad, and Caria. It is hardly possible to suppose that a single race was to be found in so many widely separated localities. Herodotus identifies the Leleges with the Carians, saying that the ancient name of that race was Leleges, whereas Pausanias declares that the name Leleges was younger, and Athenaeus makes the Leleges serfs of the Carians. Homer introduces both Leleges and Carians as distant peoples in alliance with Troy. The former have a king Altes and a city Pedasus. Strabo counts the Leleges and the Carians different races, as intermingled that they were often identified. Both in Leucadia and in Laconia the story runs that the autochthonous inhabitants were the Leleges, whereas in Messenia the Leleges were an immigrant race who had founded Pylus. They were said to be the ancestors of the Taphians and Teleboans, two seafaring and piratic races. The only view as yet advanced which introduces any unity into these scattered notices is that of Curtius. According to him the name Leleges represents rather a stage in historical development than a single race. The name occurs always in the coast lands; and in the early stage of Greek history, when the simple barbarous tribes of older stock were stimulated to the first beginnings of progress and civilization by the appearance of foreign mariners on their shores, the mixed race of immigrants and natives was called Leleges. It is the almost universal opinion that the whole of the Aegean coast lands were occupied by homogeneous tribes of Aryan stock; on this view then the Leleges, i.e., as Strabo already maintained, the mixed people, represent one of the first stages of these original tribes in the path of civilization. Accounts which connect the Leleges with Egypt may be definitely rejected as fabulous.

See Deimling, *Leleger*; Curtius, *Greek History*, i.; Thuc., i. 4, *Finch*, x. 429; Strabo, pp. 821, 872, 880, &c.; Herod., i. 171; Pausan., i. 89, 6; Athen., vi. 271b.

LELEWEL, JOACHIM (1786-1861), Polish historian, was born at Warsaw in 1786. His family came from Prussia in the early part of the 18th century; his grandfather was appointed physician to the Polish king then reigning, and his father caused himself to be naturalized as a Polish citizen. The original form of the name appears to have been Loelheffel. From his earliest childhood the future historian showed his fondness for books. In the year 1807 we find him teacher in a school at Krzemieniec in Volhynia, and in 1814 professor of history at Vilna, a post which he quitted in 1820 for a four years' discharge of the same office at the university of Warsaw, but returned to it in 1824. His lectures enjoyed great popularity, and the enthusiasm felt for him by the students is shown in the beautiful lines addressed to him by Mickiewicz. But this very circumstance made him obnoxious to the Russian Government, and at Vilna Novosiltzev was then all-powerful. Lelewel was removed from his professorship, and returned to Warsaw, where he was elected a deputy to the diet in 1829. He joined the revolutionary movement with great enthusiasm, but was throughout deficient in energy, and, in fact, although the emperor Nicholas distinguished him as one of the most dangerous rebels, he did not appear to advantage as a man of action. On the suppression of the rebellion he made his way in disguise to Germany, and subsequently reached Paris in 1831. There, however, he was not allowed to stay long,

as the Government of Louis Philippe ordered him to quit French territory in 1835 at the request of the Russian ambassador. The cause of this expulsion is said to have been his activity in writing revolutionary proclamations. He now repaired to Brussels, where he for a time lectured on history at the university, but was from some cause or other compelled to abandon his occupation. Lelewel spent several years in Brussels in great poverty, barely earning a scanty livelihood by his writings. He died in 1861 at Paris, whether he had removed a short time previously.

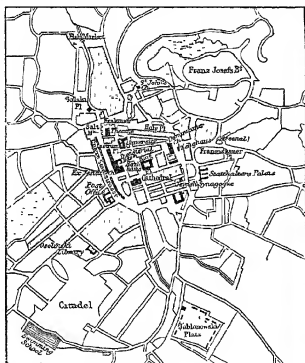

Lelewel was an indefatigable man of letters. He was of a simple austere character, and of the strictest probity—in short, of an antique type, one of the few men who have loved learning for its own sake. His literary activity was enormous, extending over the period from the "Edda Skandinavia" of 1807 to the *Géographie des Arabes*, 2 vols., Paris, 1851. Many of his works are concerned with Polish history, yet he by no means confined himself to it. Thus he has written on the trade of Carthage, on Erythraea the early geographers, and on numismatics (*La Numismatique du Moyen Age*, Paris, 1835, 2 vols., *Études Numismatiques*, Brussels, 1840). One of his most important publications was *La Géographie du Moyen Age*, Brussels, 1850-53, with an atlas of fifty plates entirely engraved by himself, for he rightly attached much importance to the accuracy of his maps that he would not allow them to be executed by any one else. His works on Polish history are monumental, they have been collected into a series under the title *Polska, dzieje i secesji jej respektowne* (Poland, her History and Affairs Surveyed), published at Poznań, 1854-1858, in 20 vols. He had intended to have written a complete history of the country on an extensive scale, but never accomplished the task. His method is shown in the little history of Poland, first published at Warsaw in Polish in 1828, under the title *Dzieje Polski*, and afterwards almost rewritten in the *Historia de Polonie*, published at Paris in 2 vols. in 1844. Two other works on Polish history which may be especially mentioned are an edition of the "Chronicle of Matthew of Cholewa" and "Ancient Memorials of Polish Legislation" (*Księga ustaw polskich i dawnościelnych*). While employed in the university library of Warsaw he studied bibliography, and the fruits of his labours may be seen in his *Bibliografia Księgowni* (A Couple of Books on Bibliography), 2 vols. 8vo, Vilna, 1823-26. The characteristics of Lelewel as an historian are great research and power to draw inferences from his facts, his style is too often careless, and his narrative is not picturesque, but his expressions are frequently terse and incisive. He has left valuable materials for a just comprehension of his career in his autobiography (*Adventures while Prosecuting Researches and Inquiries in Polish Matters*).

LELY, SIR PETER (1617-1680), a celebrated painter, was born at Soest, Westphalia, in 1617. His father, a military captain and a native of Holland, was originally called Van der Vees; the nickname of Le Lys or Lely, by which he was generally known, was adopted by his son as a proper surname. After studying for two years under Peter de Grebber, an artist of some note at Haarlem, Lely, induced by the patronage of Charles I. for the fine arts, removed to England in 1641. There he at first painted historical subjects and landscapes; and he soon became so eminent in his profession as to be employed by Charles to paint his portrait shortly after the death of Vanduyck. He afterwards portrayed Cromwell. At the Restoration his genius and gentlemanly manners won the favour of Charles II., who made him his state-painter, and afterwards knighted him. He formed a famous collection, the best of his time, containing drawings, prints, and paintings by the best masters; it sold by auction for no less than £26,000. His great example, however, was Vanduyck, whom, in some of his most successful pieces, he almost rivals. Lely's paintings are carefully finished, warm and clear in colouring, and animated in design. The graceful posture of the heads, the delicate rounding of the hands, and the broad folds of the draperies are admired in many of his portraits. The eyes of the ladies are drowsy with languid sentiment, and allegory of a commonplace sort is too freely introduced. His most famous work is a collection of portraits of the ladies of the court of Charles II., preserved at Hampton Court, and known by the title of the Windsor Beauties. Of his few historical pictures, the best is Susannah and the Elders, at Burlington House. His Juniter and Erythraea, in

the duke of Devonshire's collection, is also worthy of note. Lely was nearly as famous for crayon work as for oil-painting. Towards the close of his life he often retired to an estate which he had bought at Kew. He died of apoplexy in London (the Piazza, Covent Garden) in 1680, and was buried in Covent Garden Church, where a monument was afterwards erected to his memory. Peppy characterized Lely in a few graphic words—"a mighty proud man and full of state." The painter married an English lady of family, and left a son and daughter, who died young. His only disciples were Greenhill and Bucks-horn; he did not, however, allow them to obtain an insight into his special modes of work.

LE MANS. See MANS, LE

LEMBERG (i. e., *Leonberg*, also *Lemburg* or *Loewenburg*, Polish, *Lwow*; Lat., *Leopolis*), the capital of the Austrian crown-land of Galicia, and according to its population the third city of Austria-Hungary, lies 180 miles east of Cracow and 80 miles from the Russian frontier. The hollow of the Sarmatian plateau, in which the town is situated, is about 1000 feet above the sea-level, and, as drained by the Peltew, a tributary of the Bug, belongs to the basin of the Vistula. The Loewenburg proper or Castle Hill rises to 1300 feet. In the early part of the present century Lemberg would have been described as a small fortified place, with a number of large villages in the immediate

Plan of Lemberg

vicinity, but the fortifications were transformed into pleasure grounds about 1811, and the villages have gradually changed into suburb and town. The old city proper occupies only about 60 acres; the suburbs extend over 12 square miles. During the 16th and 17th centuries the most striking feature of Lemberg was the immense number of its ecclesiastical buildings, and it still possesses among the rest a Greek Catholic, a Roman Catholic, and an Armenian cathedral. The church of the Dominicans (an imitation of the Karlskirche at Vienna) contains a monument, by Thorwaldsen, to the countess Josepha Borkowska. Lemberg is the seat of a university, founded in 1784 by Joseph II., and restored by Francis I. in 1817; and in the national institution founded by Ossolinski it has

a noble library of books and manuscripts, and valuable antiquarian and scientific collections. The linguistic heterogeneity of the population requires the maintenance of three separate gymnasiums,—for the Poles, the Germans, and the Ruthenians respectively; and there are besides two normal colleges, a deaf and dumb institution, and a blind asylum. Industrially and commercially Lemberg is a more important city than Cracow, it has a chamber of trade and commerce, and among the leading articles of manufacture are flour, beer, vinegar, oil of oses, and matches. The population has increased from 87,109 in 1869 to 110,250 in 1880. At the former date 46,252 were Roman Catholics, 26,694 Jews, and 12,406 Greek Catholics.

Leopolis was founded about 1259 by the Ruthenian prince Daniel for his son Leo. From Cammir the Great, who captured it in 1846, it received the Magdeburg rights, and for almost two hundred years the public records were kept in German. During the whole period of Polish supremacy it was a most important city, and after the fall of Constantinople it greatly developed its trade with the East. In 1648 and 1655 it was besieged by the Cossacks, and in 1672 by the Turks. Charles XII. of Sweden captured it in 1704. In 1848 it was bombarded.

LEMMING, a small animal belonging to the order *Rodentia*, family *Muridae*, and subfamily *Arvicolinae*, or voles, of which the common water-rat and short-tailed field mouse of England are members. It is the *Myodes lemmus* (Linn.) of most modern zoological systems, the *Lemmus* *non negens* of Desmarest and some other authors. In both size and colour different specimens vary considerably, but its usual length is about two inches, and its soft fur yellowish-brown, marked with spots of dark brown and black. It has a short, rounded head, obtuse muzzle, small

Lemming

bead-like eyes, and short rounded ears, nearly concealed by the fur. The tail is very short. The feet are small, each with five claws, those of the fore feet strongest, and fitted for scratching and digging. The usual dwelling place of the lemmings is in the high lands or fells of the great central mountain chain of Norway and Sweden, from the southern branches of the Langfjeldene in Christiansand stiff to the North Cape and the Varangerfjord. South of the Arctic circle they are, under ordinary circumstances, exclusively confined to the plateaus covered with dwarf birch and juniper above the conifer region, though in Tromsø and in Finmarken they occur in all suitable localities

down to the level of the sea. The nest is formed under a tussock of grass or a stone, and constructed of short dry straws, and usually lined with hair. The number of young in each nest is generally five, sometimes only three, occasionally seven or eight, and at least two broods are produced annually. Their food is entirely vegetable, especially grass roots and stalks, shoots of the dwarf birch, reindeer lichens, and mosses, in search of which they form, in winter, long galleries through the turf or under the snow. They are restless, courageous, and pugnacious little animals. When suddenly disturbed, instead of trying to escape they will sit upright, with their back against a stone or other object of vantage, hissing and showing fight in a very determined manner.

The circumstance which has given more popular interest to the lemming than to a host of other species of the same order of animals, and has justified its treatment in a separate article in this work, is that certain districts of the cultivated lands of Norway and Sweden, where in ordinary circumstances they are quite unknown, are occasionally and at very uncertain intervals varying from five to twenty or more years, literally overrun by an army of these little creatures, which steadily and slowly advance, always in the same direction, and regardless of all obstacles, swimming across streams and even lakes of several miles in breadth, and committing considerable devastation on their line of march by the quantity of food they consume. In their turn they are pursued and harassed by crowds of beasts and birds of prey, as bears, wolves, foxes, dogs, wild cats, stoats, weasels, eagles, hawks, and owls, and never spared by man; even the domestic animals not usually predaceous, as cattle, goats, and reindeer, are said to join in the destruction, stamping them to the ground with their feet, and even eating their bodies. Numbers also die from diseases produced apparently from overcrowding. None ever return by the course by which they came, and the onward march of the survivors never ceases until they reach the sea, into which they plunge, and swimming onwards in the same direction as before perish in the waves. These extraordinary and sudden appearances of vast bodies of lemmings, and their singular habit of persistently pursuing the same onward course of migration, have given rise to various speculations, from the ancient belief of the Norwegian peasants, shared in by Olaus Magnus, that they fell down from the clouds, to the almost equally untenable hypothesis, ingeniously maintained by the late Mr W. D. Croch, that they are acting in these migrations in obedience to an instinct inherited from vastly ancient times, and are still seeking the congenial home in the submerged Atlantis, to which their ancestors of the Miocene period were wont to resort when driven from their ordinary dwelling places by crowding or scarcity of food. The principal really ascertained facts regarding these migrations, as stated by Mr R. Collett (*Proceedings of the Linnean Society*, vol. xiii. p. 327, 1878), seem to be as follows. When any combination of circumstances has occasioned an increase of the numbers of the lemmings in their ordinary dwelling places, impelled by the restless or migratory instinct possessed in a less developed degree by so many of their congeners, a movement takes place at the edge of the elevated plateau, and a migration towards the lower-lying land begins. The whole body moves forward slowly, always advancing in the same general direction in which they originally started, but following more or less the course of the great valleys. They only travel by night; and, staying in congenial places for considerable periods, with unaccustomed abundance of provender, notwithstanding all the destructive influences to which they are exposed, they multiply excessively during their journey, having still more numerous families and more frequently than in their

usual homes. The progress may last from one to three years, according to the route taken, and the distance to be traversed until the sea-coast is reached, which in a country so surrounded by water as the Scandinavian peninsula must be the ultimate goal of such a journey. This may be either the Atlantic or the Gulf of Bothnia, according as the migration has commenced from the west or the east side of the central elevated plateau. Those that finally perish in the sea, committing what appears to be a voluntary suicide, are only acting under the same blind impulse which has led them previously to cross smaller pieces of water with safety. Further information about the migrations of the lemming will be found in Mr Collett's paper referred to above, and also in those of Mr Croch in the same volume. (W. H. F.)

LEMNOS was an island in the northern part of the Aegean Sea, now called by the inhabitants Limnos. The Italian form of the name, Salimene, i.e., *ἡ νῆς Ἀλμεινῶν*, is not used in the island itself, but is commonly employed in geographical works. The island, which belongs to Turkey, is of considerable size: Piny says that the coast-line measured 112½ Roman miles, and the area has been estimated at 150 square miles. Great part of it is mountainous, but some very fertile valleys exist, to cultivate which two thousand yokes of oxen are employed. The hill-sides afford pasture for 20,000 sheep. No forests exist on the island; all the wood which is used is brought from the coast of Roumelia or from Thasos. A few mulberry and fruit trees grow, but no olives. The inhabitants number about 22,000, of whom 2000 are Turks and the rest Greeks. The chief towns are Kastro on the western coast, with a population of 4000 Greeks and 800 Turks, and Mudros on the southern coast. Kastro possesses an excellent harbour, and is the seat of all the trade carried on with the island. Greek, English, and Dutch consuls or consular agents were formerly stationed there; but the whole trade is now in Greek hands. The archbishop of Lemnos and Ai Strati, a small neighbouring island with 2000 inhabitants, resides in Kastro. In ancient times the island was sacred to Hephaestus, who as the legend tells fell on Lemnos when his father Zeus hurled him headlong out of Olympus. This tale, as well as the name *Æthalea*, sometimes applied to it, points to its volcanic character. It is said that fire occasionally blazed forth from Moeychlos, one of its mountains; and Pausanias (viii. 33) relates that a small island called Chryse off the Lemnian coast was swallowed up by the sea. All volcanic action is now extinct.

The most famous product of Lemnos is the medicinal earth, which is still used by the natives. At one time it was popular over western Europe under the name *terra argillata*. This name, like the Greek *Ἀργίλη ἀργή*, is derived from the stamp impressed on each piece of the earth, in ancient times the stamp was the head of Artemis. The Turks now believe that a vase of this earth destroys the effect of any poison drunk from it,—a belief which the ancients attached rather to the earth from Cape Kolus in Attica. Galen went to see the digging up of this earth (see Kuhn, *Medic. Gr. Opera*, vi. 178 sq.), on one day in each year a priestess performed the due ceremonies, and a wagon-load of earth was dug out. At the present time the day selected is the 6th of August, the feast of Christ the Saviour. Both the Turkish hodja and the Greek priest are present to perform the necessary ceremonies; the whole process takes place before daybreak. The earth is sold by apothecaries in stamped circular blocks. The hill from which the earth is dug is a dry mound, void of vegetation, beside the village of Kotschinos, and about two hours from the site of Hephaestus. The earth was considered in ancient times a cure for all festering wounds, and for the bite of poisonous snakes.

The name Lemnos is said by Herodotus (op. Steph. Byz.) to have been a title of Orpheus among the Thracians, and the earliest inhabitants are said to have been a Thracian tribe, called by the Greeks *Σίνες*, i.e., "the robbers." According to a famous legend the women were all deserted by their husbands, and in revenge murdered every man on the island. From this barbarous act, the expression *Λεμνιάνα δολοῦ*, *Ἀδύνατα ἔργα*, became proverbial. The Argonauts

landing soon after found only women in the island, ruled over by Hyppolyte, daughter of the old king Theseus. From the Argonauts and the Lemnian women were descended the race called Minyae, whose king Euneas, son of Jason and Hyppolyte, sent wine and provisions to the Greeks at Troy. The Minyae were expelled by a Peloponnesian tribe who came from Attica. The historical element underlying these traditions is probably that the original Thracian people were gradually brought into communication with the Greeks as navigation began to unite the scattered islands of the Aegean (see JASON); the Thracian inhabitants were barbarians in comparison with the Greek mariners. The worship of Cybele was characteristic of Thrace, whither it spread from Asia Minor at a very early period, and it deserves notice that Hyppolyte and Myrina (the name of one of the chief towns) are Amazon names, which are always connected with Asiatic Hyppolyte-worship. Coming down to a better authenticated period, we find that Lemnos was conquered by Oianes, one of the generals of Darius Hystaspes, but was soon reconquered by Miltiades, the tyrant of the Thracian Chersonese. Miltiades afterwards returned to Athens, and Lemnos continued an Athenian possession till the Macedonian empire absorbed it. On the vicissitudes of its history in the 3d century B.C. see Kohler in *Mitchell Inst. Athen.*, l. p. 261. The Romans declared it free in 167 B.C., but gave it over in 155 B.C. to Athens, and retained nominal possession of it till the whole of Greece was made a Roman province. A colony of Attic *καταπολιται* was established by Pericles, and many inscriptions on the island relate to Athenians. After the division of the empire, Lemnos of course passed under the Byzantine emperors, it shared in the vicissitudes of the eastern provinces, being alternately in the power of Greeks, Italians, and Turks, till finally the Turkish sultans became supreme in the Aegean. In 1476 the Venetians successfully defended Kalkinos or Kotschinos against a Turkish siege; but in 1667 Kastro was captured by the Turks from the Venetians after a siege of sixty-three days. Kastro was again besieged by the Russians in 1770.

Homer speaks as if there were one town in the island called Lemnos, but in historical times there was no such place. There were two towns, Myrina, now Kastro, and Hephestia. The latter was the chief town; it must have been of considerable number, the types being sometimes the Athenian goddesses and her owl, sometimes native religious symbols, the eagle of the Dioscuri, Apollo, &c. Few coins of Myrina are known. They belong to the period of Attic occupation, and bear Athenian types. A few coins are also known which bear the name, not of either city, but of the whole island. Coins were the first tokens of the state of Hephestia, at a deserted place named Paleokastro on the east coast. It had once a splendid harbour, which is now filled up. Its situation on the east explains why Miltiades attacked it first when he came from the Chersonese. It surrendered at once, whereas Myrina, with its very strong citadel built on a perpendicular rock, sustained a siege. It is said that the shadow of Mount Athos fell at sunset on a bronze cow in the agora of Myrina. Pliny says that Athos was 87 miles to the north-west; but the real distance is about 40 English miles. One legend localized in Lemnos still requires notice. Philoctetes was left there by the Greeks on their way to Troy; and there he suffered ten years' agony from his wounded foot, until Ulysses and Neoptolemus induced him to accompany them to Troy. He is said by Sophocles to have lived beside Mount Hermæus, which *Æschylus* (*Agam.*, 262) makes one of the beacon points to flash the news of Troy's downfall home to Argos.

See Rhodé, *Reise Lemnos*, *Compte Rend. Acad. Inscriptions* (where the latest account by a skilled eye-witness is to be found); the above-mentioned facts about the present state of the island are taken from him); also Hunt in Walpole's *Travels*; Belon du Mans, *Observations de plusieurs singularités*, &c.; Finlay, *Greece under the Romans*; Von Hammer, *Gesch. des Osm. Reiches*; 624, 664, 665, 1837. The chief references in ancient writers are *Hæcat.*, s. 693; v. 138; xiv. 239, &c.; Herod., iv. 146; Str., pp. 124, 330; Plin., iv. 23; xxxv. 13.

LEMON, the fruit of *Citrus Limonium*, Risse, which is regarded by some botanists as a variety of *Citrus medica*, L. The wild stock of the lemon tree is a native of the valleys of Kumaon and Sikkim in the North-West Provinces of India, ascending the mountains to a height of 4000 feet, and occurring under several forms.

The lemon seems to have been unknown to the ancient Greeks and Romans, and to have been introduced by the Arabs into Spain between the 12th and 13th centuries. In 1494 the fruit was cultivated in the Azores, and largely shipped to England, but since 1838 the exportation has ceased. As a cultivated plant the lemon is now met with throughout the Mediterranean region, in Spain and Portugal, in California and Florida, and in almost all tropical

and subtropical countries. Like the apple and pear, it varies exceedingly under cultivation. Russo and Poiteau enumerate forty-seven varieties of this fruit, although they maintain as distinct the sweet lime, *Citrus Limetta*, Russo, with eight varieties, and the sweet lemon, *Citrus Lumia*, Risse, which differ only in the fruit possessing an insipid instead of an acid juice, with twelve varieties.

The lemon is more delicate than the orange, although, according to Humboldt, both require an annual mean temperature of 62° Fahr. Unlike the orange, which presents a fine close head of deep green foliage, it forms a straggling bush, or small tree, 10 to 12 feet high, with paler, more scattered leaves, and short angular branches with sharp spines in the axils. The flowers, which possess a sweet odour quite distinct from that of the orange, are in part hermaphrodite and in part unisexual, the outside of the corolla having a purplish hue. The fruit, which is usually crowned with a nipple, consists of an outer rind or peel, the surface of which is more or less rough from the convex oil receptacles imbedded in it, and of a white inner rind, which is spongy and nearly tasteless, the whole of the interior of the fruit being filled with soft parenchymatous tissue, divided into about ten to twelve compartments, each generally containing two or three seeds. The white inner rind varies much in thickness in different kinds, but is never so thick as in the citron. As lemons are much more profitable to grow than oranges, on account of their keeping properties, and from their being less liable to injury during voyages, the cultivation of the lemon is preferred in Italy wherever it will succeed. In damp valleys it is liable to be attacked by a fungus called "charbon" (*Dematium monophyllum*), the stem, leaves, and fruit becoming covered with a blackish dust. This is said to be coincident with or subsequent to the attacks of a small oval brown insect, *Chermes hesperidum*, L. Trees grown in the shade, and not properly exposed to sunlight and air, suffer most severely from these pests. Syringing with milk of lime when the young insects are hatched, and before they have fixed themselves to the plant, seems to be the most effectual remedy known. Since the year 1875 this fungoid disease has made great ravages in Sicily among the lemon and citron trees, especially around Catania and Messina. M. Heritte attributes the prevalence of the disease to the fact that the growers have induced an unnatural degree of fertility in the trees, permitting them to bear enormous crops year after year. This loss of vitality is in some measure met by grafting healthy scions of the lemon on the bitter orange, but trees so grafted do not bear fruit until they are eight or ten years old.

The lemon tree is said to be exceedingly fruitful, a large one in Spain or Sicily ripening as many as three thousand fruits in favourable seasons. In the south of Europe lemons are collected more or less during every month of the year, but in Sicily the chief harvest takes place from the end of October to the end of December, those gathered during the last two months of the year being considered the best for keeping purposes. The fruit is gathered while still green. After collection the finest specimens are picked out and packed in cases, each containing about four hundred and twenty fruits, and also in boxes, three of which are equal to two cases, each lemon being separately packed in paper. The remainder, consisting of ill-shaped or unsound fruits, are reserved for the manufacture of the essential oil and juice. The whole of the sound lemons collected are usually packed in boxes, but those which are not exported immediately are carefully picked over and the unsound ones removed before shipment. The exportation is continued as required until April and May. The large lemon with a rougher rind, which appear in the London market in July and August, are grown at Sorrento

near Naples, and in this case are allowed to remain on the trees until ripe.

Candied lemon peel is usually made in England from a larger variety of the lemon cultivated in Sicily on higher ground than the common kind, from which it is distinguished by its thicker rind and larger size. This kind, known as the Spadaforte lemon, is also allowed to remain on the trees until ripe, and when gathered the fruit is cut in half longitudinally and pickled in brine, before being exported in casks. Before candying the lemons are soaked in fresh water to remove the salt. Citrons are also exported from Sicily in the same way, but these are about six times as expensive as lemons, and a comparatively small quantity is shipped. Besides those exported from Messina and Palermo, lemons are also imported into England to a less extent from the Riviera of Genoa, and from Malaga in Spain, the latter being the most esteemed. Of the numerous varieties the wax lemon, the imperial lemon, and the Gaeta lemon are considered to be the best.

The Greek island of Andros is said to produce ten millions of lemons annually; these are exported chiefly to Constantinople, the Black Sea, and the Danube, realizing an average price of £1 to £1, 3s. per thousand.

Until recently the United States have been large importers of lemons, at good prices, from the Mediterranean. In 1878 Palermo exported 463,977 boxes of this fruit, at 6s. 6d. per box. Owing to increased facilities for transit, and the hazardous character of the trade, the lemons are now chiefly exported by the proprietors of small plantations, who, in their eagerness to dispose of their stock, glut the market at New York and Philadelphia, and sometimes find the speculation a ruinous one.

For some years past lemons have been extensively cultivated in the south of California, and the new industry will probably affect the Mediterranean trade to a serious extent. In 1874 half a million Californian lemons were received in San Francisco. Since it was found that, with a little care in the selection of the soil, these trees could be grown throughout the State, they have been planted in immense numbers, and the produce of each tree has been found to bring from 80s to 60s. It has been estimated that in a few years the produce will be equal to the requirements of the Pacific States and Territories, and that ultimately the whole of the United States may be supplied with lemons from California. In east Florida also, where suitable land is obtainable at 15 to 20 dollars an acre, lemons, limes, citrons, and more especially oranges, are being raised in abundance. In New South Wales lemons are also grown, having been introduced into Sydney about the year 1790.

Lemons of ordinary size contain about 2 ounces of juice, of specific gravity 1.038-1.045, yielding on an average 32½ to 42-58 grains of citric acid per ounce. The amount of the acid, according to Stoddart, varies in different seasons, decreasing in lemons kept from February to July, at first slowly and afterwards rapidly, until at the end of that period it is all split up into glucose and carbonic acid,—the specific gravity of the juice being in February 1.046, in May 1.041, and in July 1.037, while the fruit is hardly altered in being distinguished as druggists' essence of lemon. An additional product is obtained by immersing the scarified lemons in warm water and separating the oil which floats off. *Essence of Citron distillate* is obtained by rubbing the surface of fresh lemons (or of those which have been submitted to the action of the *œnéille à piquer*) on a coarse grate of tinnet iron, and distilling the grated peel. The oil so obtained is colourless, and of inferior fragrance. An acid sold at a lower price, while that obtained by the cold processes has a yellow colour and powerful odor.

Essence of lemon is chiefly brought from Messina and Palermo packed in copper bottles holding 26 to 50 kilograms or more, and sometimes in tinned bottles of smaller size. It is said to be rarely found in a state of purity in commerce, almost all that comes into the market being diluted with the cheaper distilled oil. This fact may be considered as proved by the price at which the essence of lemon is sold in England, this being less than it costs the manufacturer to make it. When long kept the essence deposits a white

grains of it. From hesperidine it differs in dissolving in potash without alteration. It molts at 57°.

Various modes of preserving lemon juice in small quantities for medicinal or domestic use have been suggested. Mr Judine states that if allowed to deposit and then filtered through paper it keeps well. Dr Symes recommends heating the juice to 165° Fahr., filling bottles with it at that temperature, and immediately closing them, when perfectly full so as to keep out access of air. Another writer advises the addition of 10 per cent of alcohol. Perhaps the most simple method is to keep it covered with a layer of olive or almond oil in a closed vessel furnished with a glass tap, by which the clear liquid may be drawn off as required.

As a commercial article for use on shipboard as a preventive of scurvy, lemon juice is largely consumed. By the provisions of the Act of Parliament 30 & 31 Vict. c. 124, § 4, every ship going to other countries where lemon or lime juices cannot be obtained is required to take sufficient to give 1 ounce to every member of the crew daily. Of this juice it requires about 13,000 lemons to yield 1 pipe (108 gallons). Suchian juice in November yields about 9 ounces of crude citric acid per gallon, but only 6 ounces if the fruit is collected in April. The crude juice was formerly exported to England, and was often adulterated with sea-water, but is now almost entirely replaced by lime juice. It is said, however, to be still an article of considerable export from Turkey, where lemons are abundantly grown, to Odessa. But a concentrated lemon juice for the manufacture of citric acid is prepared in considerable quantities, chiefly at Messina and Palermo, by boiling down the crude juice in copper vessels over an open fire until its specific gravity is about 1.250, seven to ten pipes of raw making only one of concentrated lemon juice. Of this concentrated juice Messina exported in 1877 1,631,332 kilograms, valued at 2,446,996 lire, and in 1878 Naples exported it to the value of 4767.

Lemon juice for this purpose is prepared also from the fruits of limes and Bergamot oranges. It is said to be sometimes adulterated with sulphuric acid on arrival in England.

Essence or Essential Oil of Lemon.—The essential oil contained in the rind of the lemon also occurs in commerce as a distinct article. It is manufactured chiefly in Sicily, at Reggio, Calabria, and at Mentone and Nice in France. The small and irregularly shaped fruits are employed while still green, in which state the yield of oil is greater than when they are quite ripe. In Sicily and Calabria the oil is extracted in November and December, as follows. A workman cuts three longitudinal slices of each lemon, leaving a three-cornered central core having a flat piece of the rind on one side and base. These pieces are then divided transversely and cut on one side, and the strips of peel are thrown in another place. Next day the pieces of peel are deprived of their oil by pressing four or five times successively the outer surface of the peel (not the rind) bent into a convex shape, against a flat piece of wood. The pieces are then left hand and wrapped round the forefinger. The oil exudes in the hand, which are ruptured more easily in the fresh fruit than in the state in which lemons are imported, yield up their oil to the sponge, which when saturated is squeezed into an earthen vessel furnished with a spout and capable of holding about three pints. After a time the oil separates from the watery liquid which accompanies it, and is then decanted. By this process four hundred fruits yield 9 to 14 ounces of essence. The pieces of pulp are afterwards expressed to obtain lemon juice, and then distilled to obtain the small quantity of volatile oil they contain. At Mentone and Nice a different process is adopted. The lemons are placed in a *œnéille à piquer*, a shallow bowl of pewter about 6½ inches in diameter, having a lip for pouring on one side and a closed tube at the bottom about 6 inches long and 1 inch in diameter. A number of stout brass pins stand up about half an inch from the bottom of the vessel. The workman rubs a lemon over the pins, which rupture the oil vesicles, and the oil collects in the tube, which when it becomes full is emptied into another vessel that it may separate from the aqueous liquid mixed with it. When filtered it is known as *Essence de Citron ou Zeste*, or, in the English market as perfume's essence of lemon. Inferior qualities being distinguished as druggists' essence of lemon. An additional product is obtained by immersing the scarified lemons in warm water and separating the oil which floats off. *Essence of Citron distillate* is obtained by rubbing the surface of fresh lemons (or of those which have been submitted to the action of the *œnéille à piquer*) on a coarse grate of tinnet iron, and distilling the grated peel. The oil so obtained is colourless, and of inferior fragrance. An acid sold at a lower price, while that obtained by the cold processes has a yellow colour and powerful odor.

Essence of lemon is chiefly brought from Messina and Palermo packed in copper bottles holding 26 to 50 kilograms or more, and sometimes in tinned bottles of smaller size. It is said to be rarely found in a state of purity in commerce, almost all that comes into the market being diluted with the cheaper distilled oil. This fact may be considered as proved by the price at which the essence of lemon is sold in England, this being less than it costs the manufacturer to make it. When long kept the essence deposits a white

greasy stearoptene, apparently identical with the *bergaptene* obtained from the essential oil of the Bergamot orange. The chief constituent of oil of lemon is the terpene, $C_{15}H_{24}$, boiling at $348^{\circ} \pm 8^{\circ} \text{ Fahr}$, which, like oil of turpentine, readily yields crystals of terpin, $C_{15}H_{24} \cdot 3O_2H_2$, but differs in yielding the crystalline compound, $C_{15}H_{24} \cdot 3O_2H_2 + 3HCl$, oil of lemons also contains, according to Tilden, another hydrocarbon $C_{15}H_{22}$, boiling at 320° Fahr , a small amount of *cymene*, and a compound acetic ether, $C_{15}H_{22}O_2 \cdot C_2H_5$. The natural essence of lemon not being wholly soluble in rectified spirit of wine, an essence for calendering purposes is sometimes prepared by digesting 6 ounces of lemon peel in one pint of pure alcohol of 95 per cent, and when the resid has become brittle, which takes place in about two and a half hours, powdering it and percolating the alcohol through it. This article is known as lemon flavour.

The name lemon is also applied to some other fruits. The Java lemon is the fruit of *Citrus javanensis*, El., the pear lemon of a variety of *Citrus Lemetta*, and the pearl lemon of *Citrus margarita*. The fruit of a passion-flower, *Passiflora laricifolia*, is sometimes known as the water-lemon, and that of a Berberidaceous plant, *Podophyllum peltatum*, as the wild lemon. In France and Germany the lemon is known the citron, and hence much confusion arises concerning the fruits referred to in different works. The essential oil known as oil of cedar is usually a fictitious article instead of being prepared, as its name implies, from the citron (*Fr cedarius*). An essential oil is also prepared from *Citrus Limetta*, Risso, at Squillac in Calabria, and has an odour like that of Bergamot lime.

The juice of the sweet lime (*Citrus Lemetta*, Risso), which is now largely substituted in the British navy for lemon juice for the prevention of scurvy, is imported principally from Montserrat. This island, although it only contains an area of 47 square miles, possesses the most extensive and best cultivated plantations of limes, *Citrus Lemetta*, in the world. About thirty years ago a small plantation was commenced in the island by Mr Bulke, at considerable outlay and with no prospect of an immediate return, and hence was not at first attended with success. But the Montserrat Lime Juice Co now own 600 acres, bearing 12000 trees. Although the fruit is collected all the year round, it is never gathered from the trees, but gangs of women labourers are sent out about 5 o'clock in the morning to collect all the fallen fruit. These when brought home are immediately sorted into sound and unsound fruits. The sound fruits are then bruised by hand in an *aspidiot*, a mortar-like vessel with a number of projections on the bottom by this means the oil collects in the rind are ruptured and the oil collects at the bottom of the vessel. More oil may be obtained from green fruits, but these yield less juice and less citric acid, and are therefore not gathered. The limes are then placed in a hopper with a sliding bottom through which they are superheated by steam, and are then immediately washed with projecting spikes of different lengths. By these the fruit is torn to small pieces, which fall on a coarse copper sieve placed below. After passing through this strainer the juice is run directly into oaken puncheons or casks containing 100 gallons. These casks are filled quite full so as to exclude air, and bunged down immediately.—the small proportion of essential oil contained in the vegetable matter which passes through the sieve helping to preserve the juice from decomposition. The slightly musky flavour of lime juice is produced by keeping, even after a few days, although the fresh juice is quite free from it. The whole of the lime juice collected in the morning must be pressed for lime juice the same day, as the juice rapidly loses citric acid when exposed to the air, even as much as 8 ounces in one day, or the whole of the acid in three weeks. Even when run at once into the casks, although it may contain 18 or 14 ounces or rarely 15 ounces of citric acid per gallon, it seldom contains more than 6 or 10 ounces on arrival in England. The mass of fruit pulp, &c., remaining on the sieve is put in bags of coir or coconut fibre, and a number of these are placed one upon another, with strainers between, and then submitted to strong pressure in a screw press, to obtain more juice, the marc left after pressure being returned to the plantation as manure. The unsound limes are treated in like manner and the juice boiled down in copper pans to a consistence of about 40° (Twaddle), a loss of citric acid taking place if the liquor be further concentrated. It then forms a black fluid of a consistence approaching that of treacle, and is exported in casks to England for the manufacture of citric acid. Turbines of steam power are used as the motive for the machinery. Although the lime begins to bear in three or four years, until the trees are seven or eight years old the crops are very small. The trees require pruning and attention to keep them free from a species of mistletoe with red or yellow berries and a kind of dodder. They are usually manured with cow or sheep manure. A fringe resembling the lemon tree is also found in the same manner which attacks the lemon trees in Europe, occasionally injure the plantations. For these reasons they are continually being extended. The young plants are grown from seeds picked out of the straining staves, and are planted about 15 yards apart. In the plantations in the higher parts of the island the limes show a

tendency to assume the form of a lemon and to become thicker skinned, while nearer the sea they are smaller, more globular, and thinner skinned. The young leaves of the lime are used for perfuming the water in finger-glasses, a few being placed in the water and bruised before use. In 1874 concentrated lime juice was exported from Montserrat to the value of £28800, and in 1878 Surinam exported 34,900 litres of lime juice. From Dominica 11,285 gallons, valued at £1825, were shipped in 1875.

Other trees belonging to the same natural order to which the name of limes have been given are *Citrus aeda*, and *Atlantia monophylla*, the wild lime of the Hindus *Agave condensis*, the açooche lime of North America, and *Salix europæa*, the common lime or Linden tree, belong to other natural orders.

LEMONNIER, PIERRE CHARLES (1715-1799), a distinguished astronomer, was born in Paris, November 23, 1715, where his father combined the practice of astronomy with the profession of philosophy. His first recorded observation was made before he was sixteen, and the presentation of an elaborate lunar map procured for him admission to the Academy, April 21, 1736, at the early age of twenty. He was chosen in the same year to accompany Maupertuis and Clairaut on their geodesical expedition to Lapland. In 1738, shortly after his return, he explained, in a memoir read before the Academy, the striking advantages of Flamsteed's mode of determining right ascensions. Indeed his persistent recommendation of English methods and instruments combined with the labours of Lacaille to effect a revolution in French practical astronomy, and constituted the most eminent of his services to science. He corresponded with Bradley, was the first to represent the effects of nutation in the solar tables, and introduced, in 1742, the use of the transit-instrument at the Paris observatory. He visited England in 1748, and in company with the earl of Morton and Short the optician continued his journey to Scotland, where he observed the annular eclipse of July 26. The liberality of Louis XV., in whose favour he stood high, furnished him with the means of procuring the best instruments, many of them by English makers, and gave him the command of the royal printing establishment for the publication of his works. Amongst the fruits of his industry may be mentioned a laborious investigation of the disturbances of Jupiter by Saturn, the results of which were employed and confirmed by Euler in his prize essay of 1748; a series of lunar observations extending over fifty years; some interesting researches in terrestrial magnetism and atmospheric electricity, in the latter of which he detected a regular diurnal period; and the determination of the places of a great number of stars, including twelve separate observations of Uranus, between 1765 and its discovery as a planet. In his lectures at the Collège de France he first publicly expounded the analytical theory of gravitation, and his timely patronage secured the services of Lalande for astronomy. His temper was irritable, and his hasty utterances exposed him to retorts which he did not readily forgive. Against Lalande, his jealousy having been excited by his preference for Lacaille, he closed his doors "during an entire revolution of the moon's nodes." His career was arrested by paralysis late in 1791, and a repetition of the stroke terminated his life. He died at Héril near Bayeux, May 31, 1799. By his marriage with Mademoiselle de Cussy, he left three daughters, one of whom became the wife of Lagrange. He was admitted in 1739 to the Royal Society, and was one of the one hundred and forty-four original members of the Institute.

He wrote *Histoire Céleste*, 1741; *Théorie des Comètes*, 1748, a translation, with additions, of Halley's *Synopsis*, *Institutions astronomiques*, 1748, an improved translation of Keil's text-book; *Nouveau Zodiaque*, 1765, *Observations de la Lune, du Soleil, et des Planètes fixes*, 1761-78; *Lens du magnétisme*, 1775-78, &c.

LEMUR, a term applied by Linnaeus to a group of mammals, and suggested by the nocturnal habits and strange ghost-like appearance of some of its members. As they had previously no vernacular appellation in English, it has been generally adopted, and is now completely anglicized, making "lemurs" in the plural. The French call them *Makis*, the Germans *Habibeyen*, in allusion to their forming, in appearance at least, a transition from monkeys to ordinary quadrupeds. For the same reason they are called *Prosimies* by some systematic writers. When the name was bestowed by Linnaeus, only five species were known, of which one, *L. volans*, Linn., *Galeopithecus volans* of modern writers, is now removed by common consent from the group. Notwithstanding the discovery of many new and curious forms, the lemurs remain a very natural and circumscribed division of the animal kingdom, though no longer considered a single genus, but divided up into many genera and even families.

The Lemurs, or Lemnroid animals as they ought more properly to be called, were formerly associated with the monkeys in the Linnaean order *Primates*, and afterwards in the *Quadrumana* of Cuvier, forming in that order the third main division, called by Geoffroy St Hilaire *Strepsirrhini*, on account of the twisted form of the external nostrils, a division equivalent in value to the *Catarrhina* or Old World and the *Platyrrhina* or New World monkeys. As more complete knowledge of their organization has been gradually attained, the interval which separates them structurally from the monkeys has become continually more evident, and they are now considered either as a distinct suborder of the *Primates*, or even as forming an order apart, without any very near affinities with the animals with which they have hitherto been so closely associated.¹

The existing species are not numerous, and do not diverge widely in their organization or habits, being all of small or moderate size, all adapted to an arboreal life, climbing with ease, and, as they find their living, which consists of fruits, leaves, birds' eggs, small birds, reptiles, and insects, among the branches of the trees, they rarely have occasion to descend to the ground. None are aquatic, and none burrow in the earth. Many of the species, but by no means all, are nocturnal in their habits, spending the day in sleeping in holes, or rolled up in a ball, perched on a horizontal branch, or in the fork of a tree, and seeking their food by night. Their geographical distribution is very peculiar; by far the larger proportion of species, including all those to which the term "lemur" is now especially restricted, are exclusively inhabitants of Madagascar, where they are so abundant and widely distributed that it is said by M. Grandidier, who has contributed more than any other traveller to enrich our knowledge of the structure and manners of these animals, that there is not a little wood in the whole island in which some of them cannot be found. From Madagascar as a centre a few species less typical in character extend through the African continent westward as far as Senegambia, and others are found in the Oriental region as far east as the Philippine Islands and Celebes.

The following are the essential anatomical characters common to the whole group:—

Teeth heterodont, or divided by their form into incisors, canines, and molars, and diphyodont, or consisting of a first and second set. Molars multicuspidate. Skull with

complete bony margin to the orbits, which communicate freely (except in *Tarsius*) with the temporal fossae. Lacrymal foramen outside the margin of the orbit. Clavicles well developed. Radius and ulna distinct. Scaphoid, lunar, and central bones of the carpus almost always separate. Five digits on the manus and pes, though the index of the manus may be rudimentary. Pollex (or thumb) and hallux (or great toe) always well developed—the latter especially large, opposable to the other digits, and with a flat nail. The index or second digit of the pes always terminating in a long pointed claw. The fingers and toes generally not tapering towards their extremities, but (except in *Chiromys*) dilated, flattened, and rounded at the tips. Cerebral hemispheres not completely overlapping the cerebellum, and but little convoluted. Stomach simple. Cecum always present, generally large. The middle or transverse portion of the colon almost always folded or convoluted on itself. Uterus bicornuate. Placenta non-deciduate, diffused or bell-shaped—the whole of the chorion, except the cephalic pole, being covered with villositels. Allantois of great size.

In subdividing the group for the purpose of a more detailed description of the different animals of which it is composed, it must first be noted that there are two very aberrant forms, each represented by a single species—(1) the little *Tarsius* of the Indian archipelago, and (2) the singular *Chiromys* or aye-aye, which, though an inhabitant of the headquarters of the order, Madagascar, and living in the same forests and under the same external conditions as the most typical lemurs, exhibits a most remarkable specialization in the structure of its limbs and teeth, the latter being modified so as to resemble, at least superficially, those of the rodents, an order in which it was once placed. The differences between these two forms and the remaining lemurs is so great that the whole order naturally divides itself into three families, the first of which may be again divided into four subfamilies, which with the genera they contain may be thus arranged:—

Family 1. <i>Lemuridae</i> .		Genera.
Subfamily 1. <i>Indridinae</i>		<i>Indris</i> .
		<i>Propithecus</i> .
		<i>Aotus</i> .
2. <i>Lemurinae</i>		<i>Lemur</i> .
		<i>Haplorhina</i> .
		<i>Lepidolemur</i> .
3. <i>Galaginae</i>		<i>Chiropithecus</i> .
		<i>Galago</i> .
		<i>Loris</i> .
4. <i>Lorinae</i>		<i>Myotis</i> .
		<i>Myotis</i> .
		<i>Myotis</i> .
Family 2. <i>Tarsiidae</i>		<i>Tarsius</i> .
3. <i>Chiromyidae</i>		<i>Chiromys</i> .

FAMILY LEMURIDÆ.

Upper incisors two on each side, small and separated by an interval in the middle base. Upper canines large, conical, compressed, and pointed. Premolars two or three, molars three on each side above and below, with numerous, more or less pointed, cusps. In the front of the lower jaw are on each side two or three closely approximated, long, slender teeth lying almost horizontally and projecting forwards. These are generally considered to represent the molars and canines, but there is some doubt about their homologies, and they may be all considered as molars, the canine being absent. The first lower premolar larger than those behind it, and shaped like a canine. The orbit and temporal fossa widely continuous beneath the bar of bone (formed by the frontal and malar) constituting the posterior boundary of the former cavity. The zygomatic wall developed and distinct from the zygoma. All the digits of both feet (except the second of the hind foot) with flat nails, and corresponding form of ungual phalanges.

L. Subfamily *Indridinae*.—The dentition of the adult consists of thirty teeth, usually expressed by the formula $\frac{2.1.2.3}{2.1.2.3}$; but, as indicated above, they may be $\frac{2.1.2.3}{2.1.2.3}$. In the

¹ For the arguments in favour of the latter view see Alphonsus Milne-Edwards, "Observations sur quelques points de l'embryologie des Lemnroides et sur les affinités zoologiques de ces animaux," in the *Ann. des Sciences Nat.*, October 1871; and P. Gervais, "Esquisse des Lemnroides," in *Journ. de Zoologie*, tom. 1 p. 7. For those for retaining them among the *Primates*, see Milne, "On Lepidolemur and Chiromys, and on the Zoological Rank of the Lemnroides," in *Proc. Zool. Soc.*, 1875, p. 494.

middle, but not in contact with each other or the canines, in front of which they are both placed. Muzzle elongated. Ears conspicuous and tufted. Mamme two, pectoral. Ventrals C7, D12, L7 (or D13, L6), S9, C27.

Animals much about the size of a common cat, with fox-like faces, soft thick fur, and long tails well clothed with hair. Not having the same disproportionate size of the limbs as the last group, they are much more quadrupedal in their actions, walking on the ground or running along the branches of trees on all four feet, but also jump-

FIG. 3.—Skull of Ring-tailed Lemur (*Lemur catta*). $\times \frac{1}{2}$. Mrs. Roy Coll. Sanguis, *m*, upper canine; *l*, lower canine, *p*, premolar, *c*, two molars.

ing with marvellous agility. They are gregarious, living in small troops, are diurnal in their habits, but most active towards evening, when they make the woods resound with their loud cries, and feed not only on fruits and buds, but also on eggs, young birds, and insects. When at rest or sleeping, they generally coil their long, bushy tails around their bodies, apparently for the sake of the warmth it affords. They have usually either one or two young ones at a birth, which are at first nearly naked, and are emitted about, hanging close to and almost concealed by the hair of the mother's

FIG. 4.—Ring-tailed Lemur (*Lemur catta*) From life.

belly. After a while they change their position and mount upon the mother's back, where they are carried about until they are able to climb and leap by themselves. Though no member of the *Indras* has as yet lived long enough in captivity to be brought alive to Europe, the lemurs are commonly seen in menageries, and often breed in England. They present a great tendency to variation in their coloring, in consequence of which many animal species have been made. The most distinct, and at the same time most beautiful, is the ring-tailed lemur (*L. catta*, Linn., fig. 4), of a delicate grey colour, and with a long tail marked with alternating rings of black and white. This is said by Mr G. A. Shaw (*Proc Zool Soc.*, 1876, p. 132)

to be an exception to all the other lemurs in not being arboreal, but living chiefly among rocks and bushes. Pollen, however, says that it inhabits the forests of the south-west part of Madagascar, living, like its congeners, in considerable troops, and not differing from them in its habits. He adds that it is extremely gentle, and active and graceful in its movements, and utters at intervals a little plaintive cry like that of a domestic cat. All the others have the tail of uniform colour. The largest species is *L. variegatus*, Geoff., the tufted lemur, sometimes black and white, and sometimes reddish-brown, the variation apparently not depending on sex or age, but on the individual. In *L. macaco* the male is black and the female red, *L. swinhoi*, *L. collaris*, and *L. albigens* are other well-known species.

2 *Haplorhina*, Is Geoff.—Upper incisors very small, subequal, separated widely in the middle line. Those of each side in contact with each other and with the canines, the posterior one being placed on the inside, and not in front of the latter. Muzzle very short and truncated. Mamme four. There is apparently but one species, *H. griseus*, smaller than any of the true lemurs, of a dark grey colour, with round face and short ears. It is nocturnal, and lives chiefly among bamboo, subsisting on the young shoots. A second species has been named *H. sinensis*, but it is doubtful if it is not only a variety.

3 *Leptolemur*, Is Geoff., *Leptolemur* and *Microscelus*, Peters.—Upper incisors absent or only two in number and very small. Muzzle more elongated than in the last. No distinct os ciliare in the carpus. *L. musculus* is the best known species. It has, at all events when adult, no upper incisors. It is nocturnal, and like *Haplorhina* nocturnal in its habits. A second closely allied species, but with better developed penicillate, containing a pen of small styliform incisors, has been described by Peters under the name of *Microscelus capensis* (*Mondak Berlin Acad.*, 1874, p. 590).

III. Subfamily Galagidae.—Dentition as in *Leontideus*, from which they are distinguished by the elongation of the tarsus, caused by a peculiar modification of the os calcis and the navicular, the distal portion of the former and the whole of the latter having the form of nearly cylindrical rods placed side by side, while the other bones retain nearly their normal form and proportion.

1 *Chiropus*, Geoff.—Third upper penicula very much smaller than the first molar, and with only one external cusp. The animals included under this name appear to form a transition between the true lemurs and the galagos. The genus was originally established by Geoffroy St. Hilaire in 1813 for the description of three animals, only known at that time by drawings made in Madagascar by the traveller Commerson. Subsequent discoveries have brought to light several species that may be referred to it, including one or two which are sometimes considered as forming a genus apart under the name of *Microscelus*. They are all small, some being less than a rat in size, long-tailed, and nocturnal in their habits. One of the largest, *C. funebris*, is of a reddish-brown colour, and is distinguished by a dark median stripe on its back which divides on the top of the head into two branches, one of which passes forwards above each eye. The most interesting peculiarity of these animals, a knowledge of which we owe to M. Grandhoul, is that certain species (*C. samati*, *C. glauca*, *C. maki*, &c.) during the dry season coil themselves up in holes of trees, and pass into a state of torpidity, like that of the hibernating animals in the winter of northern climates. Before this takes place, an immense deposit of fat accumulates upon certain parts of the body, especially upon the basal portion of the tail, which has then dimensions corresponding to that of the well known fat-tailed sheep of the Cape, but which by the time they emerge from their torpor has acquired its normal proportions. The smallest species, to which many names have been given (*C. pusillus*, *rufus*, *smithi*, &c.), lives among the small branches on the tops of the highest trees, feeding on fruit and insects, and making nests which resemble those of birds.

2 *Galago*, Geoff.—*Otolemur*, Illiger.—Third upper penicula with two large external cusps, and nearly equaling the first molar in size. Os calcis about one-third the length of the tibia, and the navicular much longer than the cuboid. Ventrals C7, D13, L6, S9, C22-26. Tail long, and generally bushy. Ears large, rounded, naked, and capable of being folded at the will of the animal. Mamme four, two pectoral and two inguinal.

The galagos differ from all the lemurs previously mentioned, inasmuch as they are all inhabitants, not of Madagascar, but of the African continent, being widely distributed in the wooded districts from Senegambia in the west to Abyssinia in the east, and as far south as Natal. They pass the day in sleep, but are very active at night, feeding on fruit, insects, and small birds. When they descend to the ground they sit upright, and move about by jumping with their hind legs, like yahoos and kangaroos. They are pretty little animals, varying in size from that of a mouse to less than a rat, with large eyes and ears, soft woolly fur, and long tails. There are several species, of which *C. crassicaudus*, from Mozambique, is the largest. A similar species, or perhaps variety, from Angola is *C. montana*. *G. garnettii*, *alleni*, *mohoti*, *demidoffi*, and *baugottensis* are other recognized species. The last-mentioned

was the first known to science, having been brought from Sumatra by Adanson, and described in 1799 by Geoffroy, who adopted the name *Galago*, by which it was said to be called by the natives.

IV Subfamily *Lorinae*.—Dental formula as in *Lemurinae*. Index finger very short, sometimes rudimentary and nailless. Fore and hind limbs nearly equal in length. Tarsus not specially elongated. Pollux and hallux diverging widely from the other digits, the hallux especially being habitually directed backwards. Tail short or quite rudimentary. Mammary two, pectoral.

A small group of very peculiar animals, of essentially nocturnal habits, and remarkable for the slowness of their movements. They are completely arboreal, their limbs being formed only for climbing and clinging to branches, not for jumping or running. They have rounded heads, very large eyes, short ears, and thick, short, soft fur. They feed, not only on vegetable substances, but, like many of the *Lemurinae*, also on insects, eggs, and buds, which they steal upon while roosting at night. None of the species are found in Madagascar. One of the greatest anatomical peculiarities of these animals is the breaking up of the large arterial trunks of the limbs into numerous, small, parallel branches, constituting a *rete varicose*, which is found also in the two sloths, with which the lorins are sometimes confounded on account of the slowness of their movements. The animals of this group are usually divided into two genera, though the characters by which they are separated are very trivial. There are more properly two natural divisions.

A. Characterized by the index finger being small, but having the complete number of phalanges, and by their Asiatic habitat.

These form the genus *Loris* of Geoffroy St. Hilaire (1790), *Stenops* of Illiger (1811), but they were in 1812 divided by Geoffroy into two genera, *Nyctorhina* and *Loris*, a division which has been accepted by most modern zoologists.

Genus *Nyctorhina*, Geoff.—First upper incisor larger than the second, which is often only deciduous. Inner margin of the orbits separated from each other by a narrow flat space. Nasal and premaxillary bones projecting but very slightly in front of the maxillae. Body and limbs stout. No tail. Vertebrae: C7, D17, L6, S9, C12. The species are *N. tardigrada*, the common slow lemur of Java, of the Malay countries, Sumatra, and Borneo, *N. javanica*, of Java, and *N. concolor* (fig. 5), of Sum and Ceylon China. The

FIG 5.—Grey Loris (*Nyctorhina concolor*). From A. Milne-Edwards, *N. Archives du Muséum*, tome in pl. 3.

habits of all are much alike. They lead a solitary life in the recesses of large forests, chiefly in mountainous districts, where they sleep during the day in holes or fissures of large trees, rolled up into a ball, with the head between the hind legs. On the approach of evening they awake, and during the night they ramble among the branches of trees, slowly and quietly, in search of their food, which consists of tender leaves and fruit, small buds, insects, and waxes. When in quest of living prey, they move noiselessly till quite close, and then suddenly seize it with one of their hands. The female produces but one young one at a time. *L. tardigrada* was placed by Linnaeus at the head of the list of species of his genus *Lemur*, and its habits sometimes suggested the generic name, which was translated by Geoffroy to the less nocturnal and spectre-like Madagascan members of the group.¹

Genus *Loris*, Geoff.—Upper incisors very small and equal. Orbits very large, and only separated in the middle line above by a thin vertical plate of bone. Nasale and premaxillae produced forwards considerably beyond the anterior limits of the maxillae, and supporting a pointed nose. Body and limbs slender. No external tail. Vertebrae: C7, D14, L6, S8, C6.

¹ For the anatomy of this genus, see J. L. C. Shroeder van der Kolk and W. Vieillot, "Recherches d'anatomie comparée sur le genre *Stenops* Illiger," in *Biologien tot de Dierkunde*, part 1, Amsterdam, 1848-54.

One species, *L. gracilis*, the slender loris of Ceylon, a very strange-looking creature, about the size of a squirrel, or a yellowish-brown colour, with large, prominent eyes, pointed nose, long thin body, long, angularly bent, slender limbs, and no tail. Its habits are like those of the rest of the group.

B. Index finger reduced to a mere tubercle without nail. Both the lower species are from West Africa.

Genus *Perodicticus*, Bennett.—A short tail, about a third of the length of the trunk. Two or three of the anterior dorsal vertebrae have very long slender spinous processes which in the living animal project beyond the general level of the skin, forming distinct conical prominences, several of them so exceedingly thin and naked integument. *P. potto* (*Lemur potto*, Gmelin), the potto, is one of the oldest known members of the lemuroid group, having been described in 1705 by Bosman, who met with it in his voyage to Guinea. It was, however, lost sight of until 1825, when it was rediscovered in Sumatra and fully described by Bennett in the *Proceedings of the Zoological Society*, part 1, 1830-31, under the name of *Perodicticus Geoffroy*. Bennett's generic name has been retained, but the specific name bestowed by Gmelin, adopted from Bosman, has been retained. It is also found in the Gaboon. It is strictly nocturnal, and slower in its movements even than *Nyctorhina tardigrada*, which otherwise it much resembles in its habits.²

A second species, the avaritio (*P. calcaratus*, Smith), rather smaller and more delicately made, with smaller hands and feet, and rudimentary tail, constitutes the genus *Arctocebus*, Gray. It is found at Old Calabar, and in very rare, only a few individuals having as yet been met with. Its anatomy has been described by Professor Huxley in the *Proc. Zool Soc.*, 1864, p. 814. Vertebrae: C7, D15, L7, S8, C9.

FAMILY TARSIDAE

Dentition, $\frac{1}{1}$, $\frac{1}{1}$, $\frac{2}{2}$, $\frac{3}{3}$, total 94. The first upper incisor large, and in contact with its fellow of the opposite side. Canine of moderate size. Molars, with numerous pointed cusps. Lower canine semi-erect, its apex diverging from that of the single incisor. First lower premolar smaller than those behind it. Orbit to a large extent separated from the temporal fossa by a bony partition. Tibia slender, with its lower half confluent with the tibia. Second and third digits of the hind foot with compressed claws, all the other digits of both feet with flat nails. Calcaneum and navicular bone of the foot elongated as in the chirogales and galagids, but to a still greater extent. Colon short and not folded. Vertebrae: C7, D16, L8, S8, C7.

This family contains the single genus *Tarsius*, Story, of which but one species is known, *T. spectrum*, the tarsier, a very singular little animal, rather smaller than an English squirrel, with very large eyes and ears, a long thin tail, tufted at the end, and immensely elongated nasal portion of the foot, in allusion to which its generic name was given to it. It inhabits the forests of many of the islands of the Indo-Malayan archipelago, Sumatra, Borneo, Celebes, and some of the Philippines, feeds chiefly on insects and lizards, sleeps during the day, but is tolerably active at night, moving chiefly by jumping from place to place, an action for which the structure of its hind legs, which present a curious resemblance to those of a frog, seems particularly well adapted. It is rare, not more than two being generally found together, and only hangs forth one young at a time.³

FAMILY CHIROMYIDAE

Dentition of adult, $\frac{1}{1}$, $\frac{1}{1}$, $\frac{2}{2}$, $\frac{3}{3}$, total 18. Incisors very large, compressed, curved, with persistent pulps and enamel only in front as in rodents. Teeth of molar series with flat, very minutely tuberculated crowns. In the young the first set of teeth more resemble those of the avaritio (*Perodicticus*), $\frac{1}{1}$, $\frac{1}{1}$, $\frac{2}{2}$, $\frac{3}{3}$, all very small. Orbit surrounded by a ring of bone posteriorly, beneath which it communicates freely with the temporal fossa. Fibula well-developed and distinct from the tibia. All the digits of both feet with pointed rather compressed claws, except the hallux, which has a flattened nail. Middle digit of the hand excessively attenuated. Vertebrae: C7, D12, L6, S8, C7.

This family, like the last, is formed for the reception of a single genus, *Chiromys*, Cuvier, containing one species, *C. madagascariensis* (Gmelin), the aye-aye, an animal about the size of a cat, with a broad rounded head, short face, and large and naked ears. It has very large hands and long thin fingers with pointed claws, one of which (the middle or third) is remarkable for its extreme slenderness. The foot resembles that of the other lemurs in its large opposable hallux, with a flat nail, but all the other toes have pointed com-

² Van der Hoeven and Van Campen, "Onleedkundig oudesboek van der Potto van Bosman," in *Verh. Kon. Acad. van Wetenschappen*, Amsterdam, 1850.

³ F. Borestein, *Beitrag zur Naturgeschichte der Gattung Tarsius*, Berlin, 1846.

⁴ It was first named *Chiromys* by Geoffroy, but that name was withdrawn by him and it never of *Duconotus* as it had been previously given to a genus in the vegetable kingdom. It ought not, therefore, to be revived, as has been done by some modern authors.

pressed claws, like that of the second toe in the *Lemurina* and the second and third in the *Perodicticus*. Tail long and bushy. General colour dark brown, the outer fur being long and rather loose, with a woolly undercoat. Mammæ two, marginal in position. It is a native of Madagascar, where it was discovered by Sonnerat in 1789. The specimen brought to Paris by that traveller was the only one known until 1860. Since then many others have been obtained, and one has lived for several years in the gardens of the Zoological Society of London. Like so many of the lemurs, it is completely nocturnal in its habits, living either alone or in pairs, chiefly in the bamboo forests. Observations upon captive specimens have led to the conclusion that it feeds principally on succulent juices,

FIG. 6.—Skull of Ay-a-ye (*Pharyngus malagasyensis*) $\times \frac{1}{2}$
Mus. Roy. Coll. Surgeons

especially of the snger cane, which it obtains by tearing open the hard woody circumference of the stalk with its strong incisor teeth. It is said also to devour certain species of wood-boring caterpillars, which it obtains by first cutting down with its teeth upon their burrows, and then picking them out of their retreat with the claw of its attenuated middle finger. It constructs large ball-like nests of dried leaves, lodged in a fork of the branches of a large tree, and with the opening on one side. The resemblance of its teeth to those so characteristic of the *Dobsonia* caused it to be placed formerly in that order, and it was only when its anatomical characters were fully known that its true affinities with the lemurs became apparent.¹

Extract Lemnoroidea.—The disputed zoological position of the lemurs, and the great importance which has been attached to them by those naturalists who regard them as the direct transition between the lower and higher mammals, and survivors of a large group, now almost extinct, through which the higher *Primates*, including man, must have passed in the progress of their development, make the consideration of their ancient history one of great interest. Until very recently fossil lemurs were quite unknown, at all events the affinities of certain remains provisionally assigned to the group were much questioned, but within the last few years the existence of lemuroid animals in Europe during the later Eocene and early Miocene periods has been perfectly established, and remains of a large number of animals attributed, though with less certainty, to the group have been found in beds of corresponding age in North America. In 1862 Rüttimeyer described the fragment of a right maxilla and three molars from a siderolite deposit (Bohmerz) at Egerkingen, near Soleure, under the name of *Cenopithecus lemuroides*, supposing them to belong to an animal partaking of the characters of the American monkeys and the lemurs. The remains were, however, by most other paleontologists referred to the *Ungulata*. More recently M. Deltortie discovered in deposits which were being worked for phosphate of lime at Sainte Néboule de Bédier, department of Lot, France, regarded as of early Miocene age, a nearly complete cranium, and subsequently, at the same place, a portion of a ramus of a mandible of apparently the same species of animal. These were described by M. Deltortie in the *Actes de la Société Linnéenne de Bordeaux* for 1872 under the name of

Palaolemur bettlei. The cranium is generally well preserved, but unfortunately the anterior part, containing the incisor and canine teeth, has been broken off. Its affinity to the lemurine animals, especially to the African forms, the *Loxotus* and *Galagax*, is chiefly shown by the general form of the cranium, the large size and anterior direction of the orbits, the small and narrow muzzle, and the position of the lacrymal foramen outside the anterior edge of the orbit. In size the fossil is intermediate between the potto (*Perodicticus potto*) and *Galago crassicaudatus*. When the specimen came into the hands of M. Gaudry, that experienced and accurate paleontologist, with the rich treasures of the Paris Museum at hand for comparison, recognized that certain more or less fragmentary remains which had long been in the collection, and had been described from the teeth alone, and generally, though doubtfully referred to the *Ungulata*, were really nothing more than animals of the same group, and probably even the same species as *Palaolemur bettlei*. These were *Adaps parviusculus*, Cuvier, from the Paris gypsum, described and figured in the *Ossuaires fossiles*, *Aphelotherium duvernoyi*, Gervais, from the same beds, and other specimens from Barthélemy, near Apt. This result was fully acquiesced in by Gervais, who also added *Cenopithecus lemuroides*, Rüttimeyer, to the synonyms of the animal, which henceforth must be called *Adaps parviusculus*, as that was the name first assigned to it.

M. Deltortie's announcement of a fossil lemur from the south of France was soon followed by that of another species by M. H. Filhol, named *Nevolemur antiquus* (*Comptes Rendus*, 1873, tom. lxxvii p. 1111), which was afterwards more fully described and figured (*Annales des Sciences Géologiques*, tom. v. No. 4, 1874, and *Recherches sur les Phosphorites du Quercy*, 1876), and a second species of *Adaps*, of considerably larger size, *A. magnus*, Filhol, was added to the group, the latter, of which the skull is upwards of 4 inches in length, resembles M. Deltortie's in its general characters, but modified much in the way that the skulls of larger animals differ from the smaller ones of the same natural group. The brain-chamber and orbits are relatively smaller, the face larger, the muscular crests more developed, and the constriction between the cerebral and facial portion of the skull more marked. These modifications remove the skull in its general characters still further from the existing lemurs—so much so that M. Filhol refers it and the other species of *Adaps* to a distinct and hitherto unknown zoological type, intermediate between the lemurs and the pachyderms, to which he gives the name of *Pachylemur*. On the other hand he considers the *Nevolemur antiquus* found at St Antonin, which is a very small species, to be a true lemuroid, more nearly resembling *Galago senegalensis* than any existing species. Unfortunately in all these specimens the anterior part of the skull is so much injured that the character and numbers of the incisor teeth cannot be ascertained, a great want in determining the affinities of these animals. And even if the whole of the skulls were found, as long as nothing is known of the limbs, or of any other bones of the skeleton, the determination of their actual zoological position can only be considered as provisional. All the existing lemurs and pachyderms, or ungulates as they are now generally termed, are so essentially different in structure and mode of life that it is difficult to conceive of a transition from one to the other, and therefore any such forms when found will be full of interest. In skull and teeth characters, as far as they are yet known, these ancient lemur-like animals from France do not deviate sufficiently from the existing lemuroids to justify their separation, but it remains to be proved whether they had the opposable hallux and ungulate toes of the forms which now inhabit the world,

¹ R. Owen, "On the Ay-a-ye," in *Trans. Zool Soc.*, vol. v. p. 38, 1862; W. Peters, "Ueber die Säugethier-Gattung *Chiocys*," in *Abhandl. Königl. Akad. der Wissenschaften*, Berlin, 1866, p. 73.

or whether their limbs were of a more generalized type. The discussions which have taken place on their nature at all events show how little reliance can be placed upon the characters of the molar teeth alone in judging of the affinities of an extinct animal.

Perhaps the most important of all the numerous recent paleontological discoveries in the Tertiary beds of the rocky mountain district of North America has been that of animals which their describers believe to be low and generalized forms of the order *Primates*. Their existence was not suspected till 1872, in which year Professor Marsh and Professor Cope almost simultaneously announced the fact. Since that time numerous genera have been assigned to the group, including five which were previously described by Leidy from teeth alone, the nature of which he did not venture to determine. These are nearly all from the Eocene or lowest Miocene formations. Until we receive fuller information regarding the remains of these animals, it is premature to speculate upon their real character or affinities. The difficulty of doing so is at present enhanced by their describers in the provisional accounts already given adopting the old assumption that lemurs and monkeys are animals of the same general type, and speaking of them sometimes as one and sometimes as the other. It is possible that these animals, or some of them, may have been monkeys, in which case they were not lemurs; or they may have been lemurs, in which case they were not monkeys. It is possible also that they may form a connecting link between the two, and so justify their old association in one group. The recently described *Anaptomorphus homunculus* from the Lower Eocene of Wyoming, an animal smaller than *Tarsius spectrum*, is considered by Cope to be "the most simian lemur yet discovered, and probably representing the family from which the true monkeys and men were derived" (*Paleontological Bulletin*, No. 34, February 20, 1882). In this case the lemurs, which, judging by their present distribution, appear to have spread east and west from Madagascar, may have had quite a different origin.

LENA. See SIBERIA.

LENOLOS, NINON DE (1615-1705), was the daughter of a gentleman of good position in Touraine. Her long and eventful life divides into two periods, during the former of which she was the typical Frenchwoman of the gayest and most licentious society of the 17th century, during the latter the recognized leader of the fashion in Paris, and the friend of wits and poets. Of her earlier life she has said the better, and in her defence all that can be pleaded is that she had been educated by her father in the epicurean and sensual beliefs made popular by Montaigne, and that she retained throughout the frank demeanor, and disregard of money, which won from Saint Evremont the remark that she was an *honnete homme*. Against her, and the numerous specious defenses set up for her by contemporaneous and subsequent French writers, must be mentioned her absolute want of maternal feeling and even of natural shame. The well-known visit of Queen Christina to her attests the extent of her renown, or infamy, and the inefficiency of the threats of Anne of Austria prove her power. Of a perfectly different character was her later life, when, though she had continued her career of debauchery for a preposterous length of time, she settled

down to the social leadership of Paris. Then there were to be found in her salon all that was most witty and refined in France,—"ladies as well as gentlemen of the highest birth," remarks a correspondent to Madame de Sevigné, poets like Molière, abbés like Châteauneuf, Genoese preachers like Turretin, the protégé of Saint Evremont. It became the fashion for young men as well as old to throng round her, and the best of all introductions for a young man who wished to make a figure in society was an introduction to Mlle. de Lenolos. The cause for this surpassing social success is to be found perhaps as much in her past notoriety, and past intimacy with the great names of the last generation, as in the wit and tact, to which Saint Evremont, and after him Sainte-Beuve, ascribe it. Her long friendship with Saint Evremont must be shortly noticed. They were of the same age, and had been intimate in their youth, and throughout his long exile the wit seems to have kept a kind remembrance of Ninon. The few really authentic letters of Ninon herself are those addressed to her old friend, and the letters of both in the last few years of their equally long lives are exceptionally touching, and unique in the polite compliments with which they try to keep off old age. If Ninon owes part of her posthumous fame to the old wit, she owes at least as much to the young Aroust, who was presented to her as a promising boy poet by the abbé de Châteauneuf, to whom she left 2000 francs to buy books, and who, as Voltaire, was to write a letter on her which was to be the chief authority of many subsequent biographers. Her personal appearance is, according to Sainte-Beuve, best described in a novel of Mlle. de Soudry, and the characteristic of it was neither beauty nor wit, but high spirits, and perfect evenness of temperament.

The letters of Ninon published after her death were, according to Voltaire, all spurious, and the only authentic ones are those to Saint Evremont, which can be best studied in Denzmann's edition of *Saint Evremont*, and his notice on her. Sainte-Beuve has an interesting notice of these letters in the *Œuvres de La Fontaine*, vol. iv. Most biographies of Ninon are full of unauthentic stories.

LENFANT, JACQUES (1661-1728), author of numerous works, chiefly in ecclesiastical history, was born at Bazoches (Eure-et-Loir) on April 13, 1661. His father, Paul Lenfant, was Protestant pastor at Bazoches and afterwards at Châtillon-sur-Loire until the revocation of the edict of Nantes, when he removed to Caen. After studying at Saumur and Geneva, Lenfant completed his theological course at Heidelberg, where in 1684 he was ordained pastor of the French Protestant church, and appointed chaplain to the dowager electress palatine. The French invasion in 1688 compelled his withdrawal to Berlin, where in the following year he was again appointed by Frederick to be one of the ministers of the French Protestant church; this office he continued to hold until his death, ultimately adding to it that of chaplain to the king, with the dignity of consistorialrath. He visited Holland and England in 1707, and had the honour of preaching before Queen Anne, and, it is said, of being invited to become one of her chaplains. In search of materials for his histories he visited Helmstedt in 1712, and Leipzig in 1715 and 1725, but otherwise the course of his life was quite uneventful. He died at Berlin on August 7, 1728.

An exhaustive catalogue of his publications, thirty-two in all, will be found in Chantepie's *Dictionnaire*, where his personal excellences are dwelt upon with some fulness and warmth. See also *Flags France Protestante*. He is now best known by his *Histoire du Concile de Constantin, faite par ses membres d'Auteurs qui ont assisté au Concile* (Amsterdam, 1714; 2d ed., 1738; English translation, 1780). It is of course largely dependent upon the previous laborious work of Van der Hardt, but has indisputable literary merit peculiar to itself, and in particular has been printed on all sides for its famous. It was followed by *Histoire du Concile de Pise, et de sa suite* (Paris de plus mémorable depuis ce Concile jusqu'au Concile de Constantin (1724), and (posthumously) by

Histoire de la Guerre des Hussites et du Concile de Bâle (Amst., 1781), German translation, Vienna, 1783-84). Lennep was one of the chief promoters of the *Enzyklopädie Germanique*, begun in 1790, and he was associated with Besenrode in the preparation of the new French translation of the New Testament with original notes, published at Amsterdam in 1718.

LENKORAN, a town in Trans-Caucasia, on the Caspian, at the mouth of a small stream of its own name, and close to a great lagoon. The lighthouse stands in 38° 45' 38" N. lat., and 48° 50' 18" E. long. Taken by storm on New Year's day 1813 by General Kotliarski, Lenkoran was in the same year surrendered by Persia to Russia by the treaty of Gulistan along with the khanate of Talysh, of which it was the capital. In 1867 it had a population of 15,953; but according to the census of 1873 there were only 4779 inhabitants (734 Russians, 233 Armenians). The fort has been dismantled, and in trade the town is being far outstripped by Astara, the custom-house station on the Persian frontier.

The district of Lenkoran (2078 square miles), corresponding to the khanate of Talysh, is highly interesting from its physical peculiarities. It is a thickly wooded mountainous region, shut off from the dry Persian plateau by the Talysh range (7000-8000 feet high), and with a narrow marshy strip along the coast. The climate is exceptionally moist and warm (annual rainfall 52.79 inches; mean temperature in summer 75°, in winter 40°), and fosters the growth of even Indian forms of vegetation. The iron tree (*Parrotia persica*, C. A. Meyer), the silk acacia, *Carpinus Betulus*, *Quercus ibexica*, the box tree, and the walnut flourish freely, as well as the sumach, the pomegranate, and the *Gleditsia caspica*. The Bengal tiger is not unfrequently met with, and wild boars are abundant. Of the 95,482 inhabitants of Lenkoran, the Talyshians (42,999) form the most interesting and aboriginal element, belonging as they do to the Iranian family, and speaking an independently developed language closely related to Persian. They are of middle height and dark complexion, with generally straight nose, small round skull, small sharp chin, and large full eyes, which are expressive, however, rather of cunning than intelligence. They live exclusively on rice. In the northern half of the district the Tartar element predominates, and there are a number of villages (Pravolnoye, for instance, with 2000 inhabitants) occupied by various Russian sectarians.

LENNEP, a small town of Rhenish Prussia in the district of Düsseldorf, is situated 18 miles east of Düsseldorf and 9 miles south of Barmen, at a height of 1050 feet above the level of the sea. It lies in the heart of one of the busiest industrial districts in Germany, and carries on important manufactures of the finer kinds of cloth, wool, yarn, felt, and other articles. It is the seat of a small chamber of commerce, and possesses a large and well-equipped hospital. Lennep, which was the residence of the counts of Berg from 1226 to 1300, owes the foundation of its prosperity to an influx of Cologne weavers during the 14th century. Population (1880) 8077, about one-fourth of whom are Roman Catholics.

LENNEP, JACOB VAN (1802-1868), Dutch poet and novelist, was born March 24, 1802, at Amsterdam, where his father, David Jacob van Lennep, who also became known as a scholar and poet, was professor of eloquence and the classical languages in the Athenaeum. Lennep received his education partly in his native city and partly at Leyden, studying jurisprudence at the latter, and ultimately obtaining the degree of doctor of laws; he then settled as an advocate in Amsterdam. His first poetical efforts had been translations from Byron, of whom he was an ardent admirer, and in 1826 he published a collection of original *Academic Idylls* which had a modified success. His first attained genuine popularity by

the *Nederlandse Legendes*, which reproduced after the manner of Sir W. Scott, though without much psychological depth or literal accuracy, some of the more stirring incidents in the early history of his fatherland. His fame was further raised to a very high point by his comedies *Het Dorp aan die Grenzen* and *Het Dorp over die Grenzen*, which had reference to the political events of 1830. In 1829 he had broken ground in a new and hitherto untrodden field with the publication of *De Pleegsoon* ("The Adopted Son," 1829), the first of a series of historical romances in prose, which have acquired for him in Holland a position somewhat analogous to that which Scott holds throughout the reading world. The series included *De Roos van Dekama* (1837), *Onze Voorouders* (1838), *Ferdinand Huyck* (1840), *Elizabeth Musch* (1850), and *De Lotgevallen van Klaasje Zevender* (1856), several of which have been translated into German and French, and two ("The Rose of Dekama" and "The Adopted Son") into English. In a closely connected department of literature, his Dutch history for young people (*Geschiedenis van Noord-Nederland aan myne Kinderen verhaald*) is attractively written. Apart from the two comedies already mentioned, Lennep was the author of numerous dramatic pieces which have found much acceptance on the Dutch stage. For some years Lennep held a judicial appointment, and from 1853 to 1856 he was a member of the second chamber, in which he voted with the Conservative party. He died at Oosterbeek near Arnhem, on August 25, 1868. There is a collective edition of his *Poetische Werken* (18 vols., 1869-1872), and also of his *Romantische Werken* (23 vols., 1855-1872).

LENT (*lenten*, *lente*, from A. S. *lencen*, spring; comp. Du. *lente*, Germ. *lenz*), the ecclesiastical season known in the early Greek Church as *τεσσαράκωστή* (afterwards as *ἡ τεσσαράκωστή*), and in the Latin Church, from at least the 4th century, as *Quadragesima*.¹ Irenæus, in a passage which, though not free from difficulties, is yet clear enough in its general scope (*apud* Euseb., *H. E.*, v. 24), mentions that the custom of keeping a fast before Easter Sunday was quite old even in his day, but that no uniformity of observance had up to that time been established, some thinking they ought to fast for one day, others for two days, and others having further peculiarities. In Tertullian's day the Good Friday fast at all events was "communis et quasi publicæ jejuniæ religio" (*De Orat.*, c. 18), and elsewhere (*De Jejun.*, 2) he indicates his opinion that Christians ought to commemorate by a religious fast all the time during which "the bridegroom was taken away from them." This period of fasting was gradually extended, but still without uniformity of praxis. The diversity of usage covered by a common name is referred to by Socrates (*H. E.*, v. 28) as a source of perplexity to him. He tells us that in Rome the custom was to fast three continuous weeks before Easter, Saturdays and Sundays not being included; that in Illyria, Greece, and Alexandria the period of abstinence called *τεσσαράκωστή* extended over six weeks; and that in some other places, which he does not specify, the custom was to begin the fast seven weeks before Easter, but actually to observe it at intervals only for three periods of five days each, and nevertheless still to call it *τεσσαράκωστή*. Cassianus (*Coll.* 21, 5) calls attention to the fact that a fast of seven weeks, when Saturdays and Sundays, except Holy Saturday, are excluded as they ought to be, means a fast of thirty-six days in all, i.e., a title of the year, — an idea which seems to have found wide acceptance. Leo I. (*Serm.* 44) alludes to the fast of forty days as having apostolic

¹ Literally, it would seem, the fortieth day before Easter (comp. *Seogagesima*, *Septuagesima*). From *Quadragesima* comes the Italian *quaresima*, Spanish *cuaresma*, French *carême*.

authority, but the number does not seem to have been taken quite literally. In one of the homilies (*In Evang.*, xvi.) of Gregory the Great, the precise number is fixed as by Cassianus at thirty-six, but this figure is obtained by reckoning from the sixth Sunday before Easter and deducting Sundays only. In the *Corpus Særis Canonica* this passage is reproduced, but with an important change which must have been made before the end of the 8th century; it is to the effect that, in order to make up the sacred number of forty days dedicated to fasting by our Lord, it is necessary to take in as fasts the four days preceding Quadragesima Sunday. As regards the manner of observing Lent, various degrees of strictness have prevailed in the church. Perfect abstinence from all food every fasting day until evening is in theory at least required, and it has also been considered desirable that public worship with sermon should be attended daily, with frequent communion, especially on Saturday and Sunday; public amusements, especially stage plays, are prohibited, and the celebration of religious festivals, as also of birthdays and marriages, is held to be unsuitable; and increased diligence in almsgiving and deeds of charity is enjoined.

LENTIL, the seed of *Lens esculenta*, Monch, a small annual of the vetch tribe. The plant varies from 6 to 18 inches in height, and has many long ascending branches. The leaves are alternate, with six pairs of oblong-linear, obtuse, mucronate leaflets. The flowers, two to four in number, are of a pale blue colour, and are borne in the axils of the leaves, on a slender footstalk equalling the leaves in length; they are produced in June or early in July. The pods are about $\frac{1}{2}$ inch long, broadly oblong, slightly inflated, and contain two seeds, which are of the shape of a doubly convex lens, and about $\frac{1}{16}$ inch in diameter. There are several cultivated varieties of the plant, differing in size, hairiness, and colour of the leaves, flowers, and seeds. The last may be more or less compressed in shape, and in colour may vary from yellow or grey to dark brown; they are also sometimes mottled or speckled. In English commerce two kinds only of lentils are principally met with, viz., the French and the Egyptian. The former are usually vended entire, and are of an ash-grey colour externally and of a yellow tint within; the latter are usually sold like split peas, without the seed coat, and consist of the reddish-yellow cotyledons, which are smaller and rounder than those of the French lentil; the seed coat when present is of a dark brown colour. Egyptian lentils are chiefly imported from Alexandria. In 1880 there were shipped from that port 25,000 ardebs, or 17,000 quarters, of red lentils, valued at £25,000, of which amount 80 per cent. was taken by Great Britain. Considerable quantities of lentils are also imported into the United States, but are chiefly consumed by the Germans, with whom lentil soup is a favourite dish. The native country of the lentil is not known, although it is supposed to be indigenous to the Himalayas. It was probably one of the first plants brought under cultivation by mankind. The name *lens* (Heb. *לֶנֶס*) appears to be an original Semitic word, and the red pottage of lentils for which Esau sold his birthright (*Gen. xxx. 34*) was apparently made from the red Egyptian lentil. This lentil is cultivated in one or other variety in India, Persia, Syria, Egypt, Nubia, and North Africa, and in Europe, along the coast of the Mediterranean, and as far north as Germany, Holland, and France. According to Shaw, *Travels in Barbary*, lentils are dressed in that country in the same manner as beans; and in Egypt and Syria the parched seeds are exposed for sale in shops, and esteemed the best food to carry on long journeys. Lentils form a chief ingredient in the Spanish *puchero*, and are used in a similar way in France and other countries. For this purpose they are usually sold in the shelled state.

The reddish variety of the lentil ("*lentillon d'hiver*") is the kind most esteemed in Paris on account of the superior flavour of its smaller seeds. It is sown in autumn either with a cereal crop or alone, and is cultivated chiefly in the north and east of France. The large or common variety, "*lentille large blonde*," cultivated in Lorraine and at Galarand (*Eure-et-Loir*), and largely in Germany, is the most productive, lent is less esteemed. This kind has very small whitish flowers, two or rarely three on a footstalk, and the pods are generally one-seeded, the seeds being of a whitish or cream colour, about $\frac{1}{8}$ of an inch broad and $\frac{1}{16}$ inch thick. A single plant produces from 100 to 160 pods, which are flattened, about $\frac{3}{4}$ inch long and $\frac{1}{8}$ inch broad. Another variety, with seeds much in form and colour to the last, but of much smaller size, is known as the "*lentillon de Mars*." It is sown in spring. This variety and the "*lentille large*" are both sometimes called the "*lentille la reine*." A small variety, "*lentille verte du Puy*," cultivated chiefly in the department of Haute Loire and Cantal, is also grown as a vegetable and for forage. The Egyptian lentil was introduced into Britain in 1820. It has blue flowers. Another species of lentil, *E. monanthos*, L., is grown in France about Orleans and elsewhere under the name of "*jaissée*" and "*jarrière*." It is, according to M. Vilmonet, one of the best kinds of green food to grow on a poor dry sandy soil; on calcareous soil it does not succeed so well. It is usually sown in autumn with a little rye or winter oats, at the rate of a hectolitre to a hectare.

The lentil also prefers a light warm sandy soil, on rich land it runs to leaf and produces but few pods. The seeds are sown in March or April or early in May, according to the climate of the country, as they cannot endure night frosts. If for fodder they are sown broadcast, but in drills if the ripe seeds are required. The pods are gathered in August or September, as soon as they begin to turn brown,—the plants being pulled up like fax while the foliage is still green, and on a dry day left the pods split in drying and loss of seed takes place. Lentils keep best in the husk so far as flavour is concerned, and will keep good in this way for two years either for sowing or for food. An acre of green grounds on an average about 11 cwt. of seed and 30 cwt. of straw. The amount and character of the mineral matter requisite in the soil may be judged from the analysis of the ash, which in the case of a half bushel of pods—potash 34.6 per cent., soda 5.5, lime 8.8, phosphoric acid 36.5, chloride of sodium 7.6, while in the straw the percentages are—potash 10.8, lime 52.3, silica 17.6, phosphoric acid 13.3, chloride of sodium 2.1.

Lentils have recently attracted some notice among vegetarians as a food material. A Hindoo proverb says, "Rice is good, but lentils are my life." But in England they have been reputed difficult of digestion and apt to disorder the bowels and injure the sight. The husk of the seed is certainly indigestible, and to cook lentils properly requires at least two and a half hours; but undoubtedly they are richer in nutritious matter than almost any other kind of pulse, containing, according to Payen's analysis, 25.2 per cent. of nitrogenous matter (legumin), 55 per cent. of starch, and 2.6 per cent. of fatty matter. Fresenius's analysis differs in giving only 36 per cent. of starch. Emhof gives 52.61 of starch and 37.85 per cent. of nitrogenous matter. Lentils are more properly the food of the poor in all countries where they are grown, and have often been spared when better food could be obtained, hence the proverb "*Divice factus jam desunt gaudere lentis*." The seeds are said to be good for pigeons, or mixed in a groundstate with potatoes or barley for fattening pigs. The herbage is highly esteemed as green food for suckling ewes and all kinds of cattle (being said to increase the yield of milk), also for calves and lambs. Haller says that lentils are so flatulent as to kill horses. They were also believed to be the cause of severe scurfulous disorders common in Egypt. The bad reputation was probably due to the substitution of the seeds of the bitter vetch or tare lentil, *Ervum Ervilia*, L., a plant which closely resembles the true lentil in height, habit, flower, and pod, but whose seeds are without doubt possessed of deleterious properties—producing weakness, or, according to Lindley, even paralysis of the extremities in horses which have partaken of them.

A few years ago some cases of poisoning of pigs were traced by Mr W. Southall of Birmingham to the use of the seed of this plant in their food; it had been imported from Turkey under the name of *roet*, and was sold in England under the name of Egyptian peas. The chief symptom produced was severe vomiting, followed by speedy death. The poisonous principle seems to reside chiefly in the bitter seed coat, and can apparently be removed by steeping in water, since Gerard, speaking of the "*bitter vetch*" (*Ervum Ervilia*), says "*kine in Asia and in most other countries do eat thereof, being made sweet by steeping in water*." The seed of *Ervum Ervilia* is about the same size and almost exactly of the same reddish-brown colour as that of the Egyptian lentil, and when the seed coat is removed they are both of the same orange red hue, but the former is not so bright as the latter. The shape is the best means of distinguishing the two seeds, that of *E. Ervilia* being obtusely triangular.

See LENTIL is a name sometimes applied to the gulfweed *Sargassum vulgare*.

See Bailey and Trimen, *Medicinal Plants*, No. 76, *Pharmaceutical Journal* (3), vol. 2, p. 481; Watts, *Dictionary of Chemistry*, vol. III, pp. 566-71; Tyson, *Chemical Dictionary*, xiv, p. 572.

LENTINI. See LEONTINI.

LEO I., who alone of Roman pontiffs shares with Gregory I. the surname of THE GREAT, pope from 440 to 461, was a native of Rome, or, according to a less probable account, of Volterra in Tuscany. Of his family or of his early education nothing is known; that he was highly cultivated according to the standards of his time is obvious, but it does not appear that he could write Greek, or even that he understood that language. No certain traces of his early ecclesiastical career have been discovered. In one of the letters (*Ep.* 104) of Augustine, an acolyte named Leo is mentioned as having been in 418 the bearer of a communication from Sixtus of Rome (afterwards pope of that name) to Aurelius of Carthage against the Pelagians, but it is possible that this Leo is rather to be identified with the Leo a priest who is recorded to have been sent by Pope Celestine to Africa with reference to the matter of Apollinaris about the year 426. In 429, when the first unmistakable reference to Pope Leo occurs, he was still only a deacon, but already a man of commanding influence; it was at his suggestion that the *De Incarnatione* of the aged Caesarius, having reference to the Nestorian heresy, was composed in that year, and some two years later (about 431) we find Cyril of Alexandria writing to him that he might prevent the Roman Church from lending its support in any way to the ambitious schemes of Juvenal of Jerusalem. In 440, while Leo was in Gaul, whither he had been sent to compose some differences between Aetius and another general named Aribius, Pope Sixtus III. died, and the absent deacon, or rather archdeacon, was forthwith unanimously chosen to succeed him, and received consecration on his return six weeks afterwards (September 29). In 443 he began to take measures against the Manicheans (who since the capture of Carthage by Genseric in 439 had become very numerous at Rome), and in the following year he was able to report to the Italian bishops that some of the heretics had returned to Catholicism, while a large number had been sentenced to perpetual banishment "in accordance with the constitutions of the Christian emperors," and others had died; in seeking these out the help of the provincial clergy was sought. It was during the earlier years of Leo's pontificate that the events in Gaul occurred which resulted in his triumph over Hilarius of Arles, signalized by the edict of Valentinian III. (445), denouncing the contumacy of the Gallic bishop, and enacting "that nothing should be done in Gaul, contrary to ancient usage, without the authority of the bishop of Rome, and that the decree of the apostolic see should henceforth be law." In 447 he held the correspondence with Turribius of Astorga which led to the condemnation of the Priscillianists by the Spanish national church, and to the putting to death of Priscillian—an act which met with Leo's approval. In 448 he received with commendation a letter from Eutyches, the Constantinopolitan monk, complaining of the revival of the Nestorian heresy there; and in the following year Eutyches wrote his circular, appealing against the sentence which at the instance of Eusebius of Dorylaeum had been passed against him at a synod held in Constantinople under the presidency of the patriarch Flavian, and asking papal support at the oecumenical council at that time under summons to meet at Ephesus. The result of a correspondence was that Leo by his legates sent to Flavian that famous epistle in which he sets forth with great fulness of detail the doctrine ever since recognized as orthodox regarding the union of the two natures in the one person of Jesus Christ. The

narrative of the events at the "robber" synod at Ephesus belongs to general church history rather than to the biography of Leo; suffice it to say that his letter, though submitted, was not read by the assembled fathers, and that the papal legates had some difficulty in escaping with their lives from the violence of the theologians who, not content with deposing Flavian and Eusebius, shouted for the dividing of those who divided Christ. When the news of the result of this oecumenical council (oecumenical in every circumstance except that it was not presided over by the pope) reached Rome, Leo wrote to Theodosius "with groanings and tears," requesting the emperor to sanction another council, to be held this time, however, in Italy. In this petition he was supported by Valentinian III., by the empress-mother Galla Placidia, and by the empress Eudoxia, but the appeal was made in vain. A change in the position of affairs, however, was brought about by the accession in the following year of Marcian, who three days after coming to the throne published an edict bringing within the scope of the penal laws against heretics the supporters of the dogmas of Apollinaris and Eutyches. To convolve a synod in which greater orthodoxy might reasonably be expected was in these circumstances no longer difficult, but all Leo's efforts to secure that the meeting should take place on Italian soil were unavailing. When the synod of Chalcedon assembled in 451, the papal legates were treated with great respect, being provided with seats on the immediate right of the president, and Leo's former letter to Flavian was adopted by acclamation as formulating the creed of the universal church on the subject of the person of Christ. Among the reasons urged by Leo for holding this council in Italy had been the threatening attitude of the Huns; the dreaded irruption took place in the following year (452). After Aquileia had succumbed to Attila's long siege, the conqueror set out for Rome. Near the confluence of the Minio and the Po he was met by Leo, whose eloquence persuaded him to turn back. Leo, whose eloquence enhanced the impressiveness of the occurrence by an unnecessarily imagined miracle. The pope was less successful with Genseric when the Vandal chief arrived under the walls of Rome in 455, but he secured a promise that there should be no incendiarism or murder, and that three of the oldest basilicas should be exempt from plunder,—a promise which seems to have been faithfully observed. The death of Leo occurred in 461, according to the Roman breviary on April 11, on which day the festival of "Pope Leo, confessor and doctor of the church" is celebrated (duplex). The title of "doctor ecclesiae" was given by Benedict XIV. The successor of Leo was Hilarius or Hilarius, who had been one of the papal legates at the "robber" synod in 449.

As bishop of the diocese of Rome, Leo distinguished himself above all his predecessors by his preaching, to which he devoted himself with great zeal and success. From his short and pithy *Sermones* many of the lessons now to be found in the Roman breviary have been taken. Viewed in conjunction with his voluminous correspondence, the sermons sufficiently explain the secret of his greatness, which chiefly lay in the extraordinary strength and purity of his convictions as to the primacy of the successors of St. Peter at a time when the civil and ecclesiastical troubles of the civilized world made men willing enough to submit themselves to any authority whatever that could establish its right to exist by courage, honesty, and knowledge of affairs. The works of Leo I. were first collectively edited by Quenest (Lyons, 1700), and again, on the basis of this, in what is now the standard edition by Ballarín (Venice, 1758-59). Ninety-three *Sermones* and one hundred and seventy-three *Epistolae* occupy the first volume; the second contains the *Liber Sententiarum*, usually attributed to Leo, and the *De Fideione Orationum Genitum*, also ascribed, by Quenest and others, to him, but more probably the production of a certain Prosper, of whom nothing further is known. The works of Hilary of Arles are appended.

LEO II., pope from August 682 to July 683, was a Sicilian by birth, and succeeded Agatho I. Agatho had

been represented at the sixth œcumenical council (that of Constantinople in 680), where Pope Honorius I. was anathematized for his views in the Monothelitic controversy as a favourer of heresy, and the only fact of permanent historical interest with regard to Leo is that he wrote once and again in approbation of the decision of the council and in condemnation of Honorius, whom he regarded as one who "profana proditiōne immaculatam fidem subvertere conatus est" in their bearing upon the question of papal infallibility these words have excited considerable attention and controversy, and prominence is given to the circumstance that in the Greek text of the letter to the emperor in which this phrase occurs the milder expression *neposyphorov* ("subverti permittit") is used for "subvertere conatus est." Thus Hefele in his *Conciliengeschichte* (iii. 294) regards as alone expressing the true meaning of Leo. It was during Leo's pontificate that the dispendance of the see of Ravenna upon that of Rome was finally settled by imperial edict. Benedict II. succeeded him.

LEO III., whose pontificate (795-816) covered the last eighteen years of the reign of Charlemagne, was a native of Rome, and having been unanimously chosen successor of Adrian I. on December 26, 795, was consecrated to the office on the following day. His first act was to send to Charles as patriarch the standard of Rome along with the keys of the sepulchre of St Peter and of the city; a gracious and condescending letter in reply made it still more clear where all real power at that moment lay. For more than three years his term of office was quite uneventful, but at the end of that period the feelings of disappointment which had secretly been rankling in the breasts of Paschalis and Campulus, nephews of Adrian I., who had received from him the offices of *prætorius* and *æcellarius* respectively, suddenly manifested themselves in an organized attack upon Leo as he was riding in procession through the city on St George's day (April 23, 799), the object of his assailants was, by depriving him of his eyes and tongue, to disqualify him for the papal office, and, although they were unsuccessful in this attempt, he found it necessary to accept the protection of Winigis, the Frankish duke of Spolito, who came to the rescue. Having vainly requested the presence of Charles in Rome, Leo went beyond the Alps to meet the king at Paderborn; he was received with much ceremony and respect, but his enemies having sent in certain written charges, of which the character is not now known except that they were of a serious nature, Charles decided to appoint both the pope and his accusers to appear as parties before him when he should have arrived in Rome. Leo returned in great state to his diocese, and was received with honour; Charles, who did not arrive until November in the following year, lost no time in assuming the office of a judge, and the final result of his investigation was the acquittal of the pope, who at the same time, however, was permitted or rather required to clear himself by the oath of purgation. The coronation of the emperor—an act the precise meaning of which does not fall to be discussed here—followed two days afterwards; the effect of it was to bring out with increased clearness the personally subordinate position of Leo. The decision of the emperor, however, secured for Leo's pontificate an external peace which was only broken after the accession of Louis the Pious. His enemies began to renew their attacks; the violent repression of a conspiracy led to an open rebellion at Rome; serious charges were once more brought against him, when he was overtaken by death in 816. It was under this pontificate that Felix of Urgel, the adoptionist, was anathematized (795) by a Roman synod. Leo at another synod held in Rome in 810 admitted the dogmatic correctness of the "filioque," but deprecated its introduction into the creed. On this

point, however, the Frankish Church persevered in the course it had already initiated. Leo's successor was Stephen IV.

LEO IV., pope from 847 to 855, was a Roman by birth, and was unanimously chosen to succeed Sergius II. His pontificate was chiefly distinguished by his efforts to repair the damage done by the Saracens during the reign of his predecessor to various churches of the city, especially those of St Peter and St Paul. It was he who built and fortified the suburb on the right bank of the Tiber still known as the Civitas Leonina. A frightful conflagration, which he is said to have extinguished by his prayers, is the subject of Raphael's great work in the Sala dell' Incendio of the Vatican. He held three synods, one of them (in 850) distinguished by the presence of Louis II., but none of them otherwise of importance. This history of this papal struggle with Hincmar of Rheims, which began during Leo's pontificate, belongs rather to that of Nicolas I. Benedict III. was Leo's immediate successor.

LEO V., a native of Ardes, was pope for some thirty days in 903 after the death of Benedict IV. He was succeeded by Sergius III.

LEO VI. succeeded John X. in 928, and reigned seven months and a few days. He was succeeded by Stephen VIII.

LEO VII., pope from 936 to 939, was preceded by John XI., and followed by Stephen IX.

LEO VIII., pope from 963 to 965, a Roman by birth, held the lay office of "protoscrinius" when he was elected to the papal chair at the instance of Otto the Great by this Roman synod which deposed John XII. in December 963. Having been hurried with unseemly haste through all the intermediate orders, he received consecration two days after his election, which was unacceptable to the people. In February 964, the emperor having withdrawn from the city, Leo found it necessary to seek safety in flight, whereupon he was deposed by a synod held under the presidency of John XII. On the sudden death of the latter, the populace chose Benedict V. as his successor, but Otto, returning and laying siege to the city, compelled their acceptance of Leo. It is usually said that, at the synod which deposed Benedict, Leo conceded to the emperor and his successors as sovereign of Italy full rights of investiture, but the genuineness of the document on which this allegation rests is more than doubtful. Leo VIII. was succeeded by John XIII.

LEO IX., pope from 1049 to 1054, was a native of Upper Alsace, where he was born June 21, 1002. His proper name was Bruno; the family to which he belonged was of noble rank, and through his father he was related to the emperor Conrad II. He was educated at Toul, where he successively became canon and (1026) bishop; in the latter capacity he rendered important political services to his relative Conrad II., and afterwards to Henry III., and at the same time he became widely known as an earnest and reforming ecclesiastic by the zeal he showed in spreading the rule of the order of Cluny. On the death of Damasus II., Bruno was in December 1048, with the concurrence both of the emperor and of the Roman delegates, selected his successor by an assembly at Worms; he stipulated, however, as a condition of his acceptance that he should first proceed to Rome and be canonically elected by the voice of clergy and people. Setting out shortly after Christmas, he had a meeting with abbot Hugo of Cluny at Besançon, where he was joined by the young monk Hildebrand, who afterwards became Pope Gregory VII.; arriving in pilgrim garb at Rome in the following February, he was received with much cordiality, and at his consecration assumed the name of Leo IX. One of his first pontifical acts was to hold the well-known Easter synod.

An army of Swiss, called into the field by Leo's diplomacy, repelled the invasion, and Italy enjoyed peace until the death of Louis XII, two years subsequently, brought to the throne a young prince who only lived for military glory, and whose entire reign was dominated by the ambition of recovering Milan and Naples. On September 13, 1515, Francis I. totally defeated the Swiss at Marignano. One of the first consequences of the battle, which reduced Leo to submission by placing the Medici in Florence at the mercy of the victor, was the loss of Parma and Piacenza. These duchies, but recently acquired by Julius II., were reunited to Milan, and Leo, temporizing in the true spirit of Italian statecraft, consented to a public interview with Francis, and became apparently his ally. Little as the pope's professions were to be depended upon, Francis thus gained the substantial advantage of a concordat seriously restricting the liberties of the Church of France. Leo meanwhile endeavored to indemnify himself for the loss of Parma and Piacenza by seizing upon the duchy of Urbino for the benefit of his nephew Lorenzo, an enterprise fully as unscrupulous as any of the similar exploits of Caesar Borgia, and by no means executed with equal ability. After a severe struggle, however, Leo's arms triumphed for the time, but the undertaking proved as injurious to his credit as to his exchequer, and the financial exhaustion which it occasioned helped to prepare the great disaster of his reign. Another unfortunate occurrence of this period was a plot of several cardinals to poison the pope, which led to the execution of one and the imprisonment of several others. Leo has been accused of excessive severity, but apparently without reason, although he may be censured for having held out expectations of pardon which he did not intend to fulfil. This conspiracy probably made him distrustful of the sacred college as then constituted, and led to one of the most remarkable acts of his pontificate, the creation of thirty-one cardinals in a single day. This dangerous stretch of authority made him absolute master in his own court for the remainder of his reign, and it must be admitted that most of the new cardinals were men of distinguished merit. A much more momentous event was now at hand, which, however, belongs more properly to the biography of Luther than that of Leo. On All Saints' eve, 1517, the daring protest of Luther against the intolerable impetuosity and rapacity of the papal vendors of indulgences, commissioned by Leo to raise money for the rebuilding of St. Peter's, gave the signal for the Reformation. Leo was at first amused. "The axe," he said, alluding to the danger he had lately escaped from, the conspiracy of the cardinals, "is taken from the root, and laid to the branches." When at length his eyes were opened he followed the policy of mingled menace and cajolery which was alone possible where the secular arm was unavailable, and which might probably have succeeded with a man of different mould from Luther. By 1520 the breach had become irreparable, and an invincible fatality had linked the name of the most ostentatious of the popes with the profoundest humiliation of the church.

Leo died before the full extent of the calamity was apparent, and amid a full tide of political prosperity which would have easily consoled him for the diminution of his spiritual prerogatives. He had profited by the general tranquillity to expel the petty tyrants of the ecclesiastical states. Perugia, Sinigaglia, Fermo had been added to the domains of the church, and Ferrara had narrowly escaped. The death of his nephew Lorenzo about the same time made him the virtual ruler of Florence also. Abroad, his policy had apparently received a check by the election of Charles V. as emperor, but the continued rivalry between Charles and his competitor Francis soon

placed the dearest wish of his heart within his reach. "Could I recover Parma and Piacenza for the church," he had said to the Cardinal de' Medici, "I would willingly lay down my life." His wish was granted him. Allying himself with Charles, he contributed efficaciously to the expulsion of the French from Milan in November 1521. Parma and Piacenza returned to the Holy See, and there was talk of the Medici replacing the Sforzas on the ducal throne of Milan. The news reached Leo at his villa of Malhana on a November night. Overjoyed, his mind engrossed by ambitious projects, he long paced a chamber through whose open window streamed the chill and malarious air of the adjoining woods. He returned to Rome in apparent health, but on the 24th of November withdrew indisposed to his apartments, and on December 1 expired with such suddenness that the last sacraments could not be administered. Poison was generally suspected, but the circumstances alleged in support of this belief wear the aspect of inventions, and seem inconsistent with the universal dismay excited by his decease. There was more ground for this consternation than men fully knew. The most fortunate and magnificent of the popes had bequeathed his successors a religious schism and a bankrupt exchequer. If, however, his profusion had impoverished the church and indirectly occasioned the destruction of her visible unity, he had raised her to the highest rank as the apparent patron of whatever contributed to extend knowledge or to refine and embellish life. If he had not kindled the genius of Raphael, employed equally by his predecessor, he had recognized and fostered it, and in so doing had apparently reconciled antique art with Christianity, and effaced the reproach of indifference or hostility to culture which for fifteen centuries had more or less weighed upon the latter. As a patron of literature Leo's merits had been even more conspicuous—every Italian man of letters, in an age of singular intellectual brilliancy, had tasted or might have hoped to taste of his bounty; had Italy been Europe, the scholars and authors elsewhere forward in revolt would have been indissolubly attached to the Church of Rome. The essential paganism of the Renaissance art and literature was not then perceived; and even now that it is fully understood the prestige which Leo gave the church remains but little impaired. The hostility of the Renaissance to Catholicism has been unanswerably shown by Catholic writers themselves, but the popular imagination only notes that Raphael and Michelangelo wrought in the name of religion, and at the bidding of a pope. However severely then Leo may be judged from the strictly sacerdotal point of view, sacerdotalism itself cannot deny its obligations to him; while, from the point of view of liberal culture, he appears as near perfection in his ecclesiastical character as that character admits.

His personal disposition has been the subject of much controversy. "Among all the individuals who have attracted the attention of mankind, there is perhaps no one whose character has stood in so doubtful a light as that of Leo X." This exaggerated dictum of Roscoe at all events expresses the fact that man's view of Leo's character have been coloured in a more than ordinary degree by party spirit. To one class he represents the ideal of the papacy as a civilizing and beneficent institution; to another—comprising Catholics as well as Protestants—he is the personification of its worldliness and apostasy. The merit or demerit of his actions will be variously estimated to the end of time. The leading traits of his character, however, are matters of fact, which prepossessions should not be allowed to distort, and it may be confidently affirmed that they were mostly amiable and laudable. He was constitutionally kind, compassionate, and beautiful—endowed with Florentine prudence and circumspection, but cast altogether in a more liberal mould than the mercantile race from which he sprang. The best of the Medici except his father Lorenzo, he is in many points more humanly interesting than the latter, and the disadvantage at which he occasionally appears is mainly attributable to his being less perfectly equipped by nature for the part assigned to him by fortune. His geniality sometimes degenerated into indolence, and

in a certain degree injured the credit of the church. His æsthetic pantheism, though upheld by real religious sentiment, fixed the reproach of paganism upon her at the precise moment when an evangelical action was springing up. The best possible pope for the age that was going out, he was the worst possible for the age that was coming in. Hence the splendours of his administration were ephemeral, and the disaster lasting. If his reputation as a pope and a statesman is thus ambiguous, no such delation need be made from his serene fame as a patron of letters and art. In this respect he stands almost alone, except for such rare examples as his father and the modern kings of Bavaria, as a prince who did not merely strike a tacit bargain with men of genius, setting his patronage against their flattery, but one who entered into their pursuits from a genuine congeniality of taste and temperament, and aided them efficiently not only as their patron but as their companion. Unlike most exalted patrons of literature, he was a scholar first and a sovereign afterwards; hence his contact with the best intellect of his age was far more direct and personal than that of an Augustus or a Louis XIV. Great as were the obligations conferred upon individuals by his tact and discernment, it is no doubt true that the intellectual movement of his age arose and could well have subsisted without him. It is none the less true that, if not the source of that light, his court was the focus to which it converged, and which gave it back with a lustre which shall render the era that bears his name, in its literary and artistic aspects, one of the brightest periods in the history of mankind.

This life of Leo was written shortly after his death by Paolo Ottonio, bishop of Novara, who had known him intimately. Roscoe's celebrated biography, though sometimes distant and sometimes cold, is in the main a work of great merit, and very aptly comes from the entire sympathy between the author and the age he depicts and the subject of his biography. It has reserved much illustration from the notes of the German and Italian translators, Henke and Bött, but requires to be re-edited with the aid of the numerous publications from archives which have taken place since Roscoe's time. André's French life is a poor performance—partial, mainly borrowed from Roscoe, and disfigured by unsuccessful efforts at the picturesque. (H. G.)

LEO XI. (Alessandro de' Medici) was chosen, under French influence, to succeed Clement VIII. as pope on April 1, 1605, and died on April 27 of the same year. His successor was Paul V.

LEO XII. (Annibale della Genga), pope from 1823 to 1829, a native of Romagna, was born on August 22, 1760. In 1790 he first gained public recognition of his talents by the success with which he accomplished the delicate task laid upon him by Pius VI. of pronouncing a funeral discourse over the emperor Joseph II.; in 1793 he was sent as nuncio to Lucerne with the title of archbishop of Tyre; in the following year he went, also as nuncio, to Cologne; in 1805 he attended the diet of Ratisbon as papal plenipotentiary; and in 1808 he shared with Caprara a difficult mission to France. Some years of retirement at the abbey of Monticelli now followed; but in 1814 he was made the bearer of the pope's congratulations to Louis XVIII.; in 1816 he became cardinal priest of Sta. Maria Maggiore, receiving also the bishopric of Sinigaglia, while in 1820 he became cardinal vicarius. On September 28, 1823, he was chosen to fill the vacancy caused by the death of Pius VII.; at the time it was believed that he had not long to live, and, in point of fact, on the 23d day of the following December his condition became so serious that the last sacraments were administered to him; suddenly, however, he recovered. One of his first cares was for the due observance of the approaching jubilee year, and on May 27, 1824, the bull was sent forth which invited all Christendom to Rome in the following December; but foreign Governments responded coldly to the appeals made for their co-operation in forwarding pilgrims, and even Leo's own subjects viewed the preparations made in their neighbourhood with indifference or aversion, and the most determined efforts of the papal government did not succeed in averting a somewhat ridiculous failure. Throughout his pontificate Leo showed himself a man of simple tastes and laborious habits; his diplomatic relations with the European powers were on the whole characterized by firmness, tact, and moderation, and perhaps the most unfavourable criticism to be made upon his domestic policy is that it was unpractical in its heedlessness and unstatesmanlike in its severity. He

died on February 10, 1829, and was succeeded by Pius VIII.

LEO I., FLAVIUS, surnamed MAGNUS and THRAX, emperor of the East, was born about 400 A.D., in the country of the Bessi, Thrace, and succeeded Marcian in February 457. At the time of his elevation he was an obscure military tribune, but had become steward to Aspar, patrician and commander of the guards, who might himself have aspired to the purple had he not been tainted with the Arian heresy. In recommending his servant to the soldiers, who proclaimed him emperor, Aspar hoped through him to be able to exercise the reality of power. The election of Leo was ratified by the senate; his coronation by Anatolius, the patriarch of Constantinople, is said to have been the earliest instance of such an ecclesiastical ceremony. The precise nature of the military success against the barbarians which, according to the chronicles, the new emperor achieved in the first year of his reign is not accurately known. Of the more conspicuous incidents of his subsequent life, the first in chronological order is his intervention in the politico-religious troubles in Egypt, where the Eutychians had gained the upper hand, and, encouraged by the Arianizing Aspar, had made their own nominee, Timotheus Ailurus, patriarch of Alexandria. Leo made peace by deposing and banishing the new patriarch, and, when reminded by Aspar that it ill became a wearer of the purple to be guilty (as in this case he had been) of promise-breaking, retorted that it was equally unbecoming that a prince should be compelled to resign his own judgment and the public interest to the will of a subject. In 466 the Huns, invading Dacia, were defeated by Leo's generals Anthemius and Anastasius, and again by the latter in 468. In 468 Leo, in concert with Anthemius, whom in the intervening year he had caused to be made emperor of the West, equipped a naval armament against the Vandals of Africa, who, under Genseric, had long been the scourge of Italy and the Mediterranean. The large fleet of more than one thousand vessels was intrusted to the command of Leo's brother-in-law Basiliscus, who, after a prosperous passage, disembarked his troops safely at Cape Bonæ within 40 miles of Carthage, but weakly granted a truce of five days to the enemy; during the interval, favoured by the wind and the darkness of the night, the fleet of Genseric, with several fireships in tow, attacked the Roman vessels, burning and sinking one half of them, and thus causing the entire failure of the expedition. A widespread belief that the Arian Aspar had somehow helped to bring about this disastrous defeat furnished Leo with a pretext for getting rid of this dangerous kingmaker, who accordingly was treacherously put to death, along with one of his sons, in 471. To avenge (as they alleged) the murder, the Goths invaded Thrace, and ravaged the country almost to the walls of the capital. In October 473 Leo associated with himself his child grandson Leo II., and in the following year he died (February 8, 474); his successor survived him for a few months only. The somewhat misleading surname of Great borne by Leo I. is due solely to the obsequious gratitude of the orthodox party; by the Arians he was, not without some show of justice, nicknamed Macellarius ("butcher").

LEO III., FLAVIUS, surnamed THESAURARIUS, a native of Isauria, born about 680, was originally called Conon, a name which he dropped after he had risen to military distinction. In 713 he received from Anastasius II. the command of the eastern army; and, when that emperor was deposed by Theodosius III. in 716, Leo, marching to Constantinople, compelled the usurper to resign, and was himself made emperor amid much popular enthusiasm, in March 718. The internal troubles of the empire had meanwhile permitted the advance of the Arabs, who in

large numbers invested the capital by land and sea in the following August; the siege was not raised until 720. Relieved from this pressing danger, and also in 721 from a conspiracy originating with the deposed emperor Anastasius II., Leo speedily inaugurated the aggressive religious policy with which his name is associated, by promulgating, in 722, the edicts commanding the baptism of Jews and Montanists throughout the empire, and in 726 that against the "idolatry of image worship," which was destined ultimately to produce so important effects on the relations of Italy and the West with Byzantium. Instigated by Pope Gregory II., the Italians refused to obey the command to remove the pictures from their churches; and when Paulus, the newly-appointed exarch of Ravenna, sought to employ force, he was defeated and slain. A revolt which had broken out in the Cyclades and the Peloponnesus was with difficulty quelled, and an insurrection in Constantinople was only repressed after much bloodshed (730). In November 730 a council was held by Gregory II. at Rome, in which anathemas were pronounced against the destroyers of images, and therefore, by implication at least, against Leo. He retaliated by severing the Trans-Adriatic provinces from the Roman patriarchate, and by confiscating large possessions of the Roman see in Calabria and Sicily. Another council under Gregory III., in 732, joined in a solemn excommunication of all iconoclasts, and image worship was set up in Rome on a more splendid scale than had previously been known. The emperor made a last effort to relieve his exarch Eutychius, shut up in Ravenna, and to bring the pope and Italy to obedience; but the great fleet which he sent was wrecked in the Adriatic, and with it the exarchate became practically lost to the empire. The closing years of Leo's reign were disturbed by troubles with the Arabs; and 740 was made memorable by a great earthquake which devastated Constantinople, Thrace, and Bithynia. He died in 741.

LEO V, FLAVIUS, surnamed THE ARMENIAN, served as general under Nicephorus I., but was banished for treachery in 811. Shortly afterwards he was recalled and appointed commander of the eastern army by Michael I. After gaining some distinction in war with the Arabs in 812, he accompanied his sovereign, in 813, on an expedition against Crum, king of the Bulgarians. Taking advantage of the disaffection of the army during a battle with the enemy near Adrianople, he withdrew with the forces under his command, leaving Michael to total defeat. Shortly afterwards he was crowned at Constantinople without opposition (813). In 814, and again in the following year, he inflicted decisive defeats upon the Bulgarians. He then began to show great zeal against the image worshippers, but such was his severity that even his closest friend, Michael the Stammerer, who had done much to help him to the throne, ultimately turned against him. Michael was convicted of conspiracy and condemned to death, but by the intervention of his friends, who assassinated Leo in the palace chapel on Christmas Eve 820, was raised from prison to the throne.

LEO VI, FLAVIUS, surnamed SAPIENS and PHILO-SOPHUS, succeeded his father, Basil I., in 886, and died in 911. One of his first acts was to depose the well-known Photius, patriarch of Constantinople, who had been his tutor. The rest of his biography, so far as recorded, tells of unimportant wars with barbarians and struggles with churchmen. In explanation of his somewhat absurd surname, all that can be said, as Gibbon has remarked, is "that the son of Basil was less ignorant than the greater part of his contemporaries in church and state, that his education had been directed by the learned Photius, and that several books of profane and ecclesiastical science were composed by the pen, or in the name, of the imperial

philosopher." His works include a treatise on military tactics (*De Apparatu Bellico*, translated by Sir John Cheske in 1554, and frequently since), seventeen *Oracula*, in iambic verse, on the destinies of future emperors and patriarchs of Constantinople, thirty-three *Orations*, chiefly on theological subjects, and some epigrams in the Greek *Anthology*.

LEO, JOHANNES, usually called LEO AFRICANUS, sometimes ELIHERITANUS (i. e., of Granada), is best known as the author of a valuable *Africa Descriptio*, which long ranked as almost the only authority in regard more especially to the Sudan. Born probably at Granada, of a noble Moorish stock, Alhasan ibn Mohammed Abwezian Alfasi (for this was his real designation) received an excellent education at Fez, where his family settled after the expulsion from Spain. He was still in his sixteenth year when he began a course of travel which extended, not only through the northern and central parts of Africa (where he had advanced to the south-east of Lake Chad), but also into Arabia, Syria, Persia, Armenia, Tartary, and portions of Europe. As he was returning from Egypt about 1517, he was captured by pirates near the island of Goaba, and he was ultimately presented as a slave to Leo X. The pope no sooner discovered what manner of man he was than he assigned him a pension; and having persuaded him to profess the Christian faith, he stood sponsor at his baptism, and bestowed on him his own names, Johannes and Leo. The new convert, having made himself acquainted with Latin and Italian, not only taught Arabic to Ægidius Antonianus, bishop of Viterbo, and others, but wrote books in both tongues. He appears to have returned to Africa, and to have put off his Christianity, before his death, but the later part of his career is involved in obscurity. He was still alive in 1526.

The *Africa Descriptio* was originally written in Arabic, but the MS. (at one time in the library of Vincenzo Pinelli, 1558-1601) is not known to be extant. The author's own translation into possible Italian was first published by Ramusio, *Avvegamento e Viaggi*. Versions of this or of the widely used Latin translation by F. Florinus have appeared in English, French, Dutch, &c. For notices of Leo's other works see Leisbach's edition (Herborn, 1801).

LEOBESCHUTZ (Bohemian, *Libetzyce*), a town in the Prussian province of Silesia, circle of Oppeln, is situated on the Zinna, about 20 miles to the north-west of Ratibor. It carries on a considerable trade in wool, flax, and grain, its markets for these commodities being very numerously attended. The principal industries are carriage-building, wool-spinning, and glass-making. The town contains three Roman Catholic churches, a Protestant church, a synagogue, a new town-hall, and a gymnasium. Leobeschutz is known to have existed in the 10th century, and from 1524 to 1623 was capital of the principality of Jägerndorf, which was divided between Prussia and Austria in 1742. Population in 1880, 12,015.

LEOCHARES, one of the sculptors of the younger Attic school in the fine period of Greek art. He is called a young man in a pseudo-Platonic epistle which must be later than 366 B.C. He worked on the Mausoleum along with Scopas, Bryaxis, Timotheos, and Pythios about 366 B.C.; the west side of the frieze, of which all the extant fragments are in the British Museum, was entrusted to him. He made the statue of Isocrates which was erected at Athens about 354 B.C. Many other portrait statues are known to have been his work. Along with Lysippos he represented Alexander the Great engaged in a lion hunt. This group was in bronze, whereas another in the Philippon at Olympia, representing the family of Philip and Alexander, was in ivory and gold. Finally, an inscription records that he made the statues of an Athenian family. Though nothing is recorded of the character of these works, it may be gathered from the list that they were idealized.

portraits; chryselephantine statues were always ideal. Leochares was also the sculptor of many purely ideal works.

These comprise three statues of Zeus, of which one was on the Acropolis, one at the Piræus, and the third was carried away to Rome, where Pliny saw it on the Capitol, he is also recorded to have carved three statues of Apollo, one of which was bought by Dionysius of Syracuse. Absolutely nothing is known of the character of these works, but we are more fortunate in regard to his masterpiece, the Rape of Ganymede, of which many imitations have been preserved to us sufficient to give some idea of its real character. Ganymede, characterized as a shepherd by crook and syrinx, has been resting under a tree, when the eagle swoops down and bears him off direct heavenwards; the looks of both are directed upwards. Ganymede, a youth of perfect beauty, does not struggle, but yields himself completely to his captor, so that his body hangs down in easy, graceful lines. The eagle, with magnificent outstretched wings, conscious, as Pliny says, "what his burden is and to whom he bears it," grasps the boy gently with his talons, and seems to swoop straight upwards, unencumbered by the weight. The problem of supporting the figure in the air, clumsily solved in the imitation preserved at St Mark's in Venice by hanging the group up with a rope, was skillfully overcome by means of the tree from beneath which the boy has been seized; while the dog beneath, looking up after his master, both gives an appearance of naturalness to the whole scene, and suggests more vividly the idea that the boy is far above the ground. The great skill of the group lay in the manner in which the idea of swift easy motion upwards was expressed; while the widespread wings of the eagle and the drooping form of the boy gave a beautiful outline to the whole. Overbeck (*Gesch. der Griech. Plast.*, ii. 51) has well expressed the distinction between the fine character of this work and the sensualism of a later class of similar groups, where the eagle is obviously Zeus himself and not a mere messenger. The colossal acrolithic statue of Ares at Halicarnassus is sometimes attributed to Leochares, sometimes to Timotheus.

On the share of Leochares in the Mausoleum and on the style of the sculptures, see Newton, *Halicarnassus, Cnidus, and Branchidae*. On the inscriptions mentioning works of Leochares, see Overbeck, *Schriftquellen*. See also Jahn, *Archæol. Beitr.*, p. 20.

LEOMINSTER, a municipal and parliamentary borough and market-town of England in the county of Hereford, is situated in a rich agricultural country on the Lug, 160 miles west-north-west of London and 12 north of Hereford. The town has regular and spacious streets, and some fine old timber houses lend picturesque interest to its appearance. The parish church, which is of mixed architecture, including the fine Norman nave of the old priory church, and contains some of the most beautiful examples of window tracery in England, was restored in 1866, and enlarged by the addition of a south nave in 1879. The other public buildings are the corn exchange, erected in 1859 at a cost of £4000, and the town-hall, to make room for which, in 1855, the Batter Cross, a beautiful example of old timber work of the date 1663, was removed to form a private dwelling house. The principal industries of the town are leather and woollen manufactures, iron and brass founding, glove and hat making, and the manufacture of agricultural implements. Leominster originated in a monastery founded by Merwald king of Mercia, who had a castle near the town, where a fortress stood till 1056, when it was demolished by the Welsh. The town received a charter of incorporation from Queen Mary, and has sent members to Parliament since the 23d of Edward I.; in 1868 its representation was reduced from two members to one. The limits of the municipal and the parliamentary

boroughs are identical, the population in 1871 being 5863, which in 1881 had increased to 6042.

See the *History* by Price (1795) and Townsend (1868), and a paper by E. A. Freeman in *Archæologia Cambrensis*, 1868.

LEON, one of the forty-nine provinces of Spain, is bounded on the N. by Oviedo, on the E. by Palencia, on the S. by Valladolid and Zamora, and on the W. by Orense and Lugo, and has an area of 6166 square miles, with a population (in 1877) of 350,210. Its boundaries on the north and west, formed respectively by the central ridge and southerly offshoots of the great Cantabrian chain, are strongly marked; towards the south-east it merges imperceptibly into the Castilian plateau, the line of demarcation being for the most part merely conventional. It belongs partly to the Miño and partly to the Duero river system, these being separated by the montañas de Leon, which extend in a continuous wall (with passes at Manzanal and Poncedadon) from north to south-west. To the Miño flow the Sil, Boeza, Burbia, Cua, Valcarlos; the principal tributaries of the Duero are the Esla (with its affluents the Tuerito, Orbigo, Bernesga, Torio, Cuereño, and Coo) and the Valderaduey. To the north-west of the montañas de Leon is the district known as the Vierzo, a richly wooded pastoral and highland district, which in its lower valleys produces grain, fruit, and wine in abundance. The Tierra del Campo in the west of the province is fairly productive, but in need of irrigation. The hills of Leon were wrought for gold in the time of the Romans; iron is still obtained to some extent; and coal and antimony also occur. The commerce and industries of the province are unimportant. Besides Leon, the capital, the only towns of any note are Astorga and Ponferrada, respectively the Asturica Augusta and the Interamnium Flavium of the Romans. There is railway communication with Madrid; but the line from Leon to Gijón at present terminates, on the south side of the pass, at Busdongo, while that to Coruña does not extend further than Briñuela.

The province was anciently inhabited by the Vettones and Callæci, after the Roman conquest it formed part of Hispania Tarraconensis. Among the Christian kingdoms which arose in Spain at the Saracenic irruption of the 8th century reigned, Leon was one of the oldest, after that of Asturias, the title of king of Leon having been first assumed by Ordoño in 913. Ferdinand I. (the Great) of Castile united the crowns of Castile and Leon in the 11th century; the two were again separated in the 12th, until a final union took place (1230) in the person of St Ferdinand. The limits of the kingdom varied with the alternations of success and defeat in war, but roughly speaking it may be said to have embraced what are now the provinces of Leon, Palencia, Valladolid, Zamora, and Salamanca. The province of Leon prior to 1833 included Leon, Zamora, and Salamanca.

LEON, the capital of the above province, is pleasantly situated upon a rising ground in the angle formed by the Torio and Bernesga, which here unite to form the Leon, a tributary of the Esla, its distance north-west from Madrid is 258 miles. The town, which is surrounded by old and dilapidated walls, everywhere presents an aspect of ruin and decay. Many of the buildings are fine. Of these the most important is the cathedral, founded about 1195; it is built in the pointed Gothic style, of a warm cream-coloured stone, and is remarkable for its simplicity, lightness, and strength. The collegiate church of San Isidro was founded in 1083, and consecrated in 1149; it is Byzantine in character. The church belonging to the convent of San Marcos, ordered by Ferdinand V. in 1514, was begun by Charles V. in 1537, and consecrated in 1541. Other buildings of less architectural importance are the town-house, the episcopal palace, and that of the Guzman family. As might be expected from the ecclesiastical character of Leon, there are a variety of religious and charitable institutions; the industries of the place are linen weaving, glove making, and the knitting of caps and

stockings, but the trade is insignificant. The population in 1877 was 11,515.

Leon (Ario, *Leyon*) owes its name to the Legio Septima Gemina of Galba, which, under the later emperors at least, had its headquarters there. The place is mentioned under this name in the *Ann. Ant.* About 540 it fell into the hands of the Gothic king Leovigildo, and in 717 it capitulated to the Saracens. Retaken about 742, it ultimately, in the beginning of the 10th century, became the capital of the kingdom of Leon. About 906 it was taken by Almanzor, but on his death, which occurred soon afterwards, it reverted to the Spaniards. It was the seat of several ecclesiastical councils, one of which was held under Alphonso V., a second in 1090, and others in 1106, 1114, 1134, 1238, and 1298.

LEON, a city of Mexico, in the state of Guanajuato, the chief town of a department, and in population second only to the capital of the republic, from which it is distant about 100 miles. It is situated on the right bank of the Rio Torbio, in the midst of a fertile and flourishing region, and is altogether one of the best built and most prosperous places in the country, with a large trade in grain and other agricultural produce, and a number of considerable industries—cotton and woollen weaving, tanning, and saddlery. For some time Leon has aspired to become the chief town of a new state, and even to take the place of Mexico as the national capital. The opening of the railways south-east to Mexico and north-east to the Rio Grande will further stimulate its development. The foundation of Leon dates from 1576, and it has ranked as a city since 1836, but the beginning of its present prosperity belongs only to the middle of the century.

LEON, the chief city of a department of the same name in the republic of Nicaragua, situated in an extensive plain about midway between the great inland lake of Nicaragua and the Pacific Ocean. It is connected by rail (1881) with Comoto on the coast (which has taken the place of Realajo, its former port); and the line is being extended to Leon Viejo on Lake Managua, and thence to Granada. The city is spread over so wide an area that Squier, after a three months' residence, found himself discovering new and secluded portions. Its public buildings are among the finest of Central America. The cathedral (1746-1774) is a strong piece of masonry, with a roof of massive arches, which has several times been used as a fortress during the civil wars. The old episcopal palace (1678), the new episcopal palace (1873), and the college of St. Ramon (1678) also deserve to be mentioned. The population is estimated at from 20,000 to 30,000. Contiguous to Leon, and practically one with it, is the Indian pueblo of Subtiaba, which has its own public buildings, and among the rest a church which almost rivals the cathedral.

At the time of the Spanish conquest Subtiaba was the residence of the great cacique of Nagrendo, and the seat of an important temple. The city of Leon, founded by Hernandez de Cordova in 1523, was originally situated at the head of the western bay of Lake Managua, and was not removed to its present position till 1630. Thomas Gage, who visited it in 1865, describes it as a splendid city; and in 1885 it yielded rich booty to Dempsey and his company. See Squier, *Central America*, vol. I., and Scherzer, *Free States of Central America*.

LEON, LUIS PONCE DE (1528-1591), usually known as Fray Luis de Leon, Spanish religious writer, was born about 1528, most probably at Granada, entered the university of Salamanca, where Melchior Cano was a few years his senior, at the age of fourteen, and in 1544 became a member of the Augustinian community there. His academical promotion was comparatively rapid; in 1561 he obtained by public competition a theological chair at Salamanca, to which in 1571 was added that of sacred literature. His views in exegesis and Biblical criticism were so far in advance of those of the majority of his immediate contemporaries that he was denounced to the Inquisition for having written a too secular translation of the book of Canticles, and for maintaining the possibility

of correcting the text of the Vulgate. In March 1572 he was consequently thrown into prison at Valladolid, where his confinement lasted until December 1576, the charges against him were then abandoned, and he was released with an exhortation to circumspection, moderation, and prudence. He at once resumed his former posts at Salamanca, and the remainder of his days were passed in comparative peace. In 1580 a Latin commentary on Canticles was published, and in 1583-85 he gave to the world three books of a treatise on the names of Christ, which he had written in prison. In 1585 also appeared the most popular of his prose works, a treatise entitled *La Perfecta Casada* ("The Perfect Wife") for the use of a lady newly married. Shortly before his death, which occurred at Madrid on August 23, 1591, his appointment to be vicar-general of the Augustinian order was sanctioned by the pope.

It is chiefly as a poet that Fray Luis de Leon is now remembered and entitled to a high place among the classic authors of Spain. His poetical works include historical translations of all the *Eidylls* and two of the *Georgics* of Virgil, some thirty odes of Horace, forty psalms, and passages from the Greek and Italian, all characterized by much spirit and grace of style. The original pieces, which are chiefly translations, not merely possess the technical merits of idiom and versification which perhaps only Christian ears can appreciate, but in many cases give beautiful expression to feelings which are shared by the whole of the Christian world. Of one in particular, the ode "De la Vida del Cielo," Hallam has justly remarked that it is "an exquisite piece of lyric poetry, which in its peculiar line of devout aspiration has perhaps never been excelled." The works of Luis de Leon include a Spanish commentary on Canticles, which was not published until 1795, a translation, in Spanish octaves, of the same book, first printed in 1806, and an exposition of Job, which first appeared in 1779.

The first collective edition of *Obras propias y traducidas* was published by Quesvedo at Madrid in 1681, another, fuller and more carefully edited, appeared at Valencia in 1761, the latest and best is that of Merino (*Obras reconstruidas y oteadas con varios manuscritos*, 6 vols., Madrid, 1804-16). His original poems, with a German translation, by Schultze and Stueck, appeared at Minster in 1868. There are two recent German monographs on Luis de Leon (Wilke, *Fray Luis de Leon*, Halle, 1866, and Rensch, *Luis de Leon u. die spanische Inquisition*, 1878), and one in Spanish (José González de Tejada, *Vida de Fray Luis de Leon*, Madrid, 1868).

LEONARDO (or LIONARDO) DA VINCI was born in 1452 and died in 1519, having during his life excelled in almost every honourable human attainment and pursuit, the commercial and political excepted. Considering the range of his speculative as well as that of his practical powers, he seems certainly the man whose genius has the best right to be called universal of any that have ever lived. In the fine arts, he was the most accomplished painter of his generation and one of the most accomplished of the world, a distinguished sculptor, architect, and musician, and a luminous and pregnant critic. In inventions and experimental philosophy, he was a great mechanician and engineer, an anatomist, a botanist, a physiologist, an astronomer, a chemist, a geologist and geographer, an insatiable and successful explorer, in a word, along the whole range of the physical and mathematical sciences when most of those sciences were new. Unfortunately he paid the penalty of his universality. The multifariousness and the equal balance of his faculties caused him to labour promiscuously in all fields of effort. He set himself to perform tasks and to solve problems too arduous and too manifold for the strength of any single life. The consequence was that in art he was able to carry few undertakings to completion, and in science to bring no fully matured researches to the light. But the works of art which he did produce were of an excellence unapproached by his contemporaries, and only rivalled by men who came a generation after him, and profited by his example; while, in science both theoretical and applied, his unpublished writings and the records of his inventions prove him to have anticipated at a hundred points the great masters of

reasoned discovery in the ensuing age. No wonder, therefore, if there has always been a mysterious attraction about his name. He stands out to after times in the character of a great if only half-effectual magician, one pre-eminently less by performance than by power. He has been called the Faust of the Italian Renaissance. The description would be just if the legend of Faust had conferred upon its hero the artist's gift of creation, as well as the ingenuity of the mechanical inventor, and the philosopher's passion for truth. As it is, these three powers, the shaping or artistic, the contriving or mechanical, and the reasoning or philosophical, had never even been imagined as existing, still less have they ever been known actually to exist, in combination, in the same measure in which they were all combined in Leonardo.

The man thus extraordinarily gifted was the son of a Florentine lawyer, born out of wedlock by a peasant mother. The place of his birth was Vinci, a "castle" or fortified village in the Florentine territory near Empoli, from which his father's family derived its name. The Christian name of his father was Piero (the son of Antonio the son of Piero the son of Guido, all of whom had been men of law like their descendant). Leonardo's mother was called Caterina. Her relations with Ser Piero da Vinci seem to have come to an end almost immediately upon the birth of their son. She was soon afterwards married in her own rank of life. Ser Piero on his part was four times married, and had by his last two wives nine sons and two daughters; but the boy Leonardo had from the first been acknowledged by his father, who brought him up in his own house, principally, no doubt, at Florence. In that city Ser Piero followed his profession, and was after a while appointed notary to the signory, or governing council of the state, a post which several of his forefathers had filled before him. The son born to him before marriage grew up into a youth of manifest and shining promise. To signal beauty and activity of person he joined a winning charm of temper and manners, a tact for all societies, and an aptitude for all accomplishments. An inexhaustible energy lay beneath this amiable surface. Among the multifarious pursuits to which he set his hand, the favourite were modelling and drawing. His father, perceiving this, sought the advice of an acquaintance, Andrea del Verrocchio, who at once recognized the boy's vocation, and was selected by Ser Piero to be his master.

Verrocchio, as is well known, although not one of the great creative or inventive forces in the art of this age at Florence, was a thoroughly capable and spirited craftsman alike as goldsmith, sculptor, and painter, while in teaching he was particularly distinguished. In his studio Leonardo worked for several years in the company of Lorenzo di Credi and other less celebrated pupils. He had soon learnt all that his master had to teach—more than all, if we are to believe the oft-told tale of the figure, or figures, executed by the pupil in the picture of Christ's Baptism designed by the master for the monks of Vallombrosa. The work in question is now in the Academy at Florence. According to Vasari the angel kneeling on the left, with a drapery over its right arm, was put in by Leonardo, and when Verrocchio saw it his sense of its superiority to his own work caused him to forswear painting for ever after. The latter part of the story is certainly false. Moreover, a closer examination seems to detect the hand of Leonardo, not only in the figure of the angel, but also in that of Christ and in the landscape background, which are designed with extreme refinement, and painted in the new medium of oil, while the remainder of the picture has been executed by Verrocchio in his accustomed vehicle of tempera. The work was probably produced between 1480 and 1482, when Leonardo

was from eighteen to twenty years of age. By the latter date we find him enrolled in the lists of the painters' guild at Florence.

Here he continued to live and work probably for eight or nine years longer. Up till 1477 he is still spoken of as a pupil or apprentice of Verrocchio, but in 1478 he receives an independent commission from the signory, and in 1480 another from the monks of San Donato in Scopeto. He had in the meanwhile been taken into special favour by Lorenzo the Magnificent. The only memorials now existing of Leonardo's industry during this period consist of a number of scattered drawings and studies, most of them physiognomical, in chalk, pen, and silver point, besides two painted panels. One of these is a large and richly composed picture, or rather a finished preparation in monochrome for such a picture, of the Adoration of the Kings, this may have been done for the monks of San Donato, and is now in the Uffizi; the other is a similar preparation for a St. Jerome, now in the Vatican gallery at Rome. We possess, however, the record of an abundance of other work which has perished. Leonardo was not one of those artists who sought in the imitation of antique models the means of restoring art to its perfection. He hardly regarded the antique at all, and was an exclusive student of nature. From his earliest days he had flung himself upon that study with an unprecedented passion of delight and curiosity. In drawing from life he had found the way to unite precision with freedom, the subtlest accuracy of definition with vital movement and flow of line, as no draughtsman had been able to unite them before. He was the first painter to recognize light and shade as among the most significant and attractive of the world's appearances, and as elements of the utmost importance in his art, the earlier schools having with one consent neglected the elements of light and shade in favour of the elements of colour and line. But Leonardo was not a student of the broad, regular, patent appearances only of the world; its fugitive, fantastic, unaccustomed appearances attracted him most of all. Strange shapes of hills and rocks, rare plants and animals, unusual faces and figures of men, questionable smiles and expressions, whether beautiful or grotesque, far-fetched objects and curiosities, these were the things which he most loved to pore upon and keep in memory. Neither did he stop at mere appearances of any kind, but, having stamped the image of things upon his brain, went on indefatigably to probe their hidden laws and causes. The laws of light and shade, the laws of "perspective," including optics and the physiology of the eye, the laws of human and animal anatomy and muscular movement, and of the growth and structure of plants, all these and much more furnished food almost from the beginning to his insatiable spirit of inquiry. The evidence of his preferences and preoccupations is contained in the list of the lost works which he produced during this period. One of these was a painting of Adam and Eve in opaque water-colours; and in this, besides the beauty of the figures, the infinite truth and elaboration of the foliage and animals in the background are celebrated in terms which bring to mind the treatment of the subject by Albrecht Dürer, in his famous engraving done thirty years later. Again, a peasant of Vinci having in his simplicity asked Ser Piero to get a picture painted for him on a wooden shield, the father is said to have laughingly handed on the commission to his son, who thereupon shut himself up with all his noxious insects and grotesque reptiles he could find, observed and drew and dissected them assiduously, and produced at last a picture of a dragon compounded of their various shapes and aspects, which was so fierce and so life-like as to terrify all who saw it. With equal research and no less effect he painted on another occasion the head of a snake-

haired Medusa.¹ Lastly, Leonardo is related to have modelled in clay and cast in plaster, about this time, several heads of smiling women and children. In addition to these labours and researches, he was full of new ideas concerning both the laws and the applications of mechanical forces. His architectural and engineering projects were of a daring which amazed even the fellow-citizens of Alberti and Brunelleschi. History presents few figures more attractive to the mind's eye than that of Leonardo during this period of his all-capable and dazzling youth. There was nothing about him, as there was afterwards about Michelangelo, dark-tempered, secret, or morose; he was open and genial with all men. From time to time, indeed, he might shut himself up for a season in complete intellectual absorption, as when he toiled among his bats and wasps and lizards, forgetful of rest and food, and insensible to the noisomeness of their corruption; but anon we have to picture him as coming out and gathering about him a tatterdemalion company, and jesting with them until they were in fits of laughter, for the sake of observing their burlesque physiognomies; or anon as standing radiant in his rose-coloured cloak and his rich gold hair among the throng of young and old on the piazza, and holding them spell-bound while he expatiated on his plan for lifting the venerable baptistry of St John, the *bat San Giovanni* of Dante, up bodily from its foundations, and planting it anew on a stately basement of marble. Unluckily it is to the written biographies and to imagination that we have to trust exclusively for our picture. No portrait of Leonardo as he appeared during this period of his life has come down to us.

The interval between 1480 and 1487 is one during which the movements of our master are obscure, and can only be told conjecturally. Up to the former date we know with certainty that he was working at Florence, under the patronage of Lorenzo de' Medici. By the latter date he had definitely passed into the service of Duke Ludovico Sforza, called il Moro, at Milan. The main determining cause of his removal would seem to have been his selection by Ludovico for the task of erecting a great memorial statue in bronze to the honour of his victorious father, the condottiere Francesco Sforza. The project of such a monument had been already entertained by the last duke, Ludovico's elder brother. After Ludovico had possessed himself of the regency in 1480, he appears to have revived the scheme, and to have invited various artists to compete for its execution. One who complied with the invitation was the Florentine Antonio del Pollaiuolo, by whom a sketch for the monument is still preserved at Munich. It would seem as if the competition had been won by Leonardo, but a considerable time had been allowed to elapse before the work was actually put in hand. The question then arises, Was it during this period of postponement that Leonardo went on his mysterious travels to the East? The earlier biographers know nothing of these travels; recent investigation of Leonardo's MSS. has brought them to light. It has been not inaptly conjectured that the speculations of transcendental Platonism, which absorbed at this time the thoughts and the conversation of the Medicean circle, were uncongenial to

the essentially experimental cast of Leonardo's mind, and that he was not averse to escape from the atmosphere of Florence. At any rate his devouring curiosity would have made welcome the opportunity of enlarging his knowledge of men and countries by Eastern travel, even at the cost, which to one of his freethinking habits would not have been great, of a temporary compliance with Islamic observances. Certain it is that he took service as engineer with the sultan of "Babylon," which in the geographical nomenclature of those days meant Cairo, and in the course of his mission visited Egypt, Cyprus, Constantinople, the coasts of Asia Minor, especially the Cilician region about Mount Taurus, and Armenia. This biographical discovery adds to the career of Leonardo a characteristic touch of adventurous and far-sought experience. Perhaps it was his acquaintance with the Levant which made him adopt the Oriental mode of writing from right to left, a habit which some of his biographers have put down to his love of mystification, and others explain more simply by the fact (to which his friend Luca Pacioli bears explicit testimony) that he was left-handed. The probable date of Leonardo's Eastern travels falls between 1480 and 1483-84. By the last-named year, if not sooner, he was certainly back in Florence, whence he wrote to Ludovico il Moro at Milan a letter making him the formal offer of his services. The draught of this letter is still extant. It does not altogether tally with the statements of the earliest biographers, that Leonardo was recommended by Lorenzo de' Medici to the duke recent particularly for his accomplishments in music. Vasari indeed says expressly that Leonardo was the bearer to Ludovico of a lyre of his invention, ingeniously fashioned of silver in the form of a horse's head. In the autograph draft of the letter, to which we have referred, Leonardo rests his own title to patronage chiefly on his capabilities in military engineering. After explaining these under nine different heads he speaks under a tenth of his proficiency as a civil engineer and architect, and adds a brief paragraph with reference to what he can do in painting and sculpture, undertaking in particular to carry out in a fitting manner the monument to Francesco Sforza. We shall probably be safe in fixing between the years 1484 and 1485 as the date of his definitive removal to Milan.

From this time for the next fourteen or fifteen years (until the summer of 1499) Leonardo continued, with very brief intervals of absence, to reside in high favour and continual employment at the court of Ludovico il Moro. His occupations were as manifold as his capacities. He superintended the construction of military engines, and seems to have been occasionally present at sieges and on campaigns. He devised and carried out works of irrigation and other engineering schemes in the territory of the duchy. He designed a cupola for the cathedral of Milan, and was consulted on the works of Certosa of Pavia. He managed with ingenuity and splendour the masques, pageants, and ceremonial shows and festivals of the court. Withal he continued incessantly to accumulate observations and speculations in natural philosophy, working especially at anatomy with Marcantonio della Torre, and at geometry and optics with Fra Luca Pacioli, for whose book *De Divina Proportione* he designed the figures. He made excursions into the Alps, and studied and drew with minute fidelity the distribution and formation of the mountain masses. He was placed at the head of a school or "Academy" of arts and sciences, where he gathered about him a number of distinguished colleagues and eager disciples. His pupils in painting included the sons of several noble families of the city and territory.

Among the more immediate scholars of Leonardo may be mentioned Antonio Boltraffio, Marco d'Oggionio, Gian Petrucci, and

¹ A picture of this subject at the Uffizi still does duty for the original of Leonardo, but is in all likelihood merely the production of some later artist to whom the descriptions of his work have given the cue. In like manner, the Madonna in the Borghese gallery at Rome, in which occurs the motive of a bottle beaded with drops of dew, though it may well be the same painting which Vasari ascribed in the possession of Clement VII., is unquestionably the work, not of Leonardo, to whom Vasari ascribes it, but of his fellow-pupil Lorenzo di Credi. Altogether apocryphal, it may here be said, is the small Madonna which is made to pass for an early work of Leonardo in the gallery at Dresden.

the master's special friend and favorite, Salai or Salino. But by far the most important painter formed under Leonardo's influence at Milan was the admirable Bernardino Lunni. Other disciples or adherents of his school were Bazzi of Siena, called Il Sodoma, Gandenno Ferreri, Andrea Solario, Bernardino dei Conti, and Ambrogio Predis or de Predis. Several of the pupils or adherents here mentioned belong, however, to a later period of the master's life than that with which we are now concerned.

Leonardo's own chief undertakings in art during his residence at the court of Ludovico il Moro were two in number, namely, the equestrian monument of Francesco Sforza and the mural painting of the Last Supper. For the former he had probably made some preparatory sketches and models before he left Florence. After his arrival at Milan the work seems to have proceeded with many interruptions, and according to a MS. note of his own to have been finally and actively resumed in 1490. In the Royal Library at Windsor are preserved a whole series of small experimental studies for the monument. Leonardo was a great lover and student of horses, and would never be without some of the noble race in his stable. It is difficult to retrace the stages of development marked by the several sketches in question, or their relations to the final design. But it seems as if Leonardo had first proposed to represent his hero as mounted on a charger violently prancing or rearing above a fallen enemy, and had in the end decided to adopt a quieter action, more nearly resembling that of the work upon which Verrocchio was simultaneously engaged at Venice. Some difficulties must have been encountered in the casting, or there would have been no meaning in the words of Michelangelo when twelve years afterwards he is said to have taunted Leonardo with incapacity on that account. But contemporary writings are explicit to the effect that the group of horse and rider, 26 feet in height, was actually cast in bronze, and set up to the admiration and delight of the people, under a triumphal arch constructed for the purpose, during the festivities held at Milan in 1493 on the occasion of the marriage of the emperor Maximilian to a bride of the house of Sforza. Within ten years the glory of that house had departed. Ludovico, twice overthrown by the invaders whom he had himself called into Italy, lay languishing in a French prison, and his father's statue had served as a butt to the Gasccon archers of the army of Louis XII. In 1501 the duke Ercole d'Este sought leave from the French governor of Milan to have the statue removed to his own city; but nothing seems to have come of the project; and within a few years Leonardo's master-work in sculpture had passed from mischief and neglect being irretrievably destroyed.

Only a little less disastrous is the fate which has overtaken the second great enterprise of Leonardo's life at Milan, his painting of the Last Supper. This, with the Madonna di San Sisto and Michelangelo's Last Judgment, is the third most celebrated picture of the world. It was painted, twenty years the earliest of the three, on the refectory wall of the convent of Santa Maria delle Grazie at Milan, where its defaced remains are still an object of pilgrimage and wonder. The commission for the work came partly from the duke and partly from the monks of the convent. Leonardo is said to have consumed upwards of ten years upon his task, a circumstance which is not surprising when we consider his fustidious spirit and the multiplicity of other calls upon his time. But the monks were impatient, and could not make allowance for the intervals of apparent idleness, intervals really of brooding and searching and meditation, which were incidental to Leonardo's way of work. On one occasion it became necessary for the duke himself, whose dealings with his gifted servant seem to have been consistently intelligent and kind, to take the painter's part against the prior of the convent. But in

working out his conception of the scene, and in devising the pictorial means for its presentation, Leonardo allowed his craving for quintessential excellence to overmaster him. He could not rest satisfied without those richnesses and refinements of effect which are unattainable in the ordinary method of mural painting, that is, in fresco, but must needs contrive by his chemistry a method for painting on the wall in oil. Neither could any of the traditional ideals of art content him in the representation of the scene. He must toil and ponder until he had realized a more absolute set of types, and grouped them in more mastery and speaking actions, than had ever been attempted before. The master type of all, that of Christ, it is said that he could never even realize to the height of his conception at all, but left it to the last uncompleted. Unhappily Leonardo's chemistry was unequal to his purpose, and his work had begun to peel and stain within a few years of its execution. The operation of time and damp has since been accelerated at intervals by the vandalism of men. After almost disappearing, the picture has been revived once and again, latterly either from copies or from engravings taken during the earlier periods of its deterioration, until now there is probably not a vestige of the original workmanship remaining. Nevertheless, through all these veils of injury and disguise, it is still possible in some measure to appreciate the power of that creation which became from the first, and has ever since remained, the typical representation for all Christendom of the sacrament of Christ's Supper.

Goethe in his famous criticism has said all that needs to be said of the essential character of the work. The painter has departed from precedent in grouping the company of disciples, with their Master in the midst, along the far side and the two ends of a long, narrow table, and in leaving the most or service side of the table towards the spectator. The chamber is seen from a perfectly symmetrical perspective, its rear wall pierced by three plain openings which admit the sense of great distance and mystery from the open landscape beyond, by the central of these openings, which is the widest of the three, the head and shoulders of the Saviour are framed in. On his right and left are ranged the disciples in equal numbers. The severity of the composition has within a moment been broken by the words of their Master, "One of you shall betray Me." In the agitation of their consciences and affections, the disciples have started into groups or clusters along the table, some standing, some still remaining seated. There are four of these groups, of three disciples each, and each group is harmoniously interlinked by some natural connecting action with the next. Leonardo, though no student of the Greeks, has perfectly carried out the Greek principle of expressive variety in particulars subordinated to general symmetry. The relations of his groups to one another, and of each figure within the several groups to its neighbour and to the central figure of Christ, are not only triumphs of technical design, they are evidences of a complete science of human character, emotion, and physiognomy held at the service of a nobly inspired and nobly directed art. The furniture and accessories of the chamber, very simply conceived, have been rendered with scrupulous exactness and distinctness, yet they leave to the human and dramatic elements the absolute mastery of the scene. Neither do the academical deprisings of the personages impair the sense of imaginative truth with which the representation impresses us. Our first glance at the ruins of this famous picture makes us feel, and study does but strengthen the conviction, that the painter rose to the height of his argument, and realized worthily and for good this momentous scene in the spiritual history of mankind.

Of authentic preparatory studies for this work there remain but few. There is a sheet at the Louvre containing some rude sketches for the arrangement of the disciples about the table, and another of great interest at South Kensington, on which the painter has noted in writing the several dramatic motives which he proposes to embody in the disciples. At Windsor and Milan are a few finished studies in red chalk for the heads. A highly-reputed series of black crayon drawings of the same heads, of which the greater portion is at Weimar, has no just claim to originality. Of the other pictures and sculptures which Leonardo is known to have executed while in the service of the duke, such as the painting of the Nativity, sent as a present to the emperor Maximilian, and the portraits of Lucrezia Orselli and Cecilia Gallerani, one of the duke's mistresses, no trace remains, nor is there sufficient reason for accepting the recently suggested attribution to Leonardo of an

simulably wrought bust now preserved in the Louvre, of which the features are those of Ludovico's wife, the duchess Beatrice.

These services, especially the maintenance of his celebrated Academy, required on the part of Leonardo no inconsiderable outlay. On the other hand, the payments received by him seem to have been neither adequate nor regular, at all events during the latter part of his residence at the ducal court, when the exigencies of war and policy were already pressing hard upon Ludovico. Leonardo had finished his Last Supper between 1497 and 1499. In the spring of the latter year we find that he received, in consideration of payments due, the gift of a vineyard outside the city. Within a month or two his patron had fallen. Milan was taken and held in hostile occupation by the French. A contemporary historian has related with what admiration the invading monarch, Louis XII., when he entered the refectory of Sta Maria delle Grazie, fixed his gaze on the work of Leonardo, and how he desired, were it possible, that it should be transported across the Alps to France. But by this time or soon afterwards the painter himself had left Milan. In the spring of 1500 we hear of him working at Venice, where, among other things, he painted (not, it appears, from life) a portrait of Isabella Gonzaga, marchioness of Mantua. The well-known head in the manner of Leonardo at the Louvre, commonly known as the *Belle Ferronnière*, has sometimes been identified as the portrait in question; but not on sufficient grounds. Early in the next year, 1501, Leonardo was once more in Florence; and thither the same marchioness, Isabella Gonzaga, sent an envoy to endeavour to attach him to her service. His answer was not unfavourable, but the envoy reported that, though recently engaged upon one or two small pictures, he was for the moment indifferent to the brush, and wholly absorbed in mathematics. In the end he attached himself, not to the court of Mantua, but to the service of Cæsar Borgia, then in the plenitude of his criminal power, and almost within reach of the realization of his huge ambitions. Leonardo's new patron had been one of the worst enemies of the fallen Ludovico, and had entered Milan as a conqueror in the suite of the French king. But artists and men of letters formed, in those days, a caste apart, and changed service not less readily than did the *condottieri* or hired military commanders. Between the beginning of 1502 and the catastrophe which overtook the house of Borgia in the summer of 1503, Leonardo travelled as engineer in the employ of Duke Cæsar over a great part of Central Italy. In Umbria and the Marches, he visited Urbino, Pesaro, Rimini, Cesena, Cosenza, Buonconvento, Perugia, and Foligno; in Tuscany, he was at Chiusi, at Siena, at Piombino on the coast over against Elba, and southward at least as far as Orvieto and Lake Bolsena, or even, it would appear, as far as Rome. He has left notes and drawings taken at each of the stations we have named, besides a set of six large-scale maps drawn minutely with his own hand, and including nearly the whole territory of Tuscany and the Maremma between the Apennines and the Tyrrhene Sea. His excursions seem to have come to an end early in 1503, as by March of that year we find him once more in Florence.

To the period of three years' wandering which followed Leonardo's departure from Milan there ensued another period of three years, during which he lived a settled life at Florence. He was now fifty-one years of age, and the most famous artist of Italy, though within a year or two the young Michelangelo was destined to challenge his supremacy, and the still younger Raphael to apprehend and assimilate the secrets of his skill, as he did those of the skill of every great predecessor and every distinguished rival in succession. The first important commission put

into Leonardo's hands at Florence was that for an altarpiece for the church of the Servite monks (Santa Maria dell' Annunziata). The work had been already entrusted to Filippino Lippi, who had even made some beginning with it, but willingly gave up his claim in favour of his illustrious fellow-citizen. The monks undertook to lodge and nourish Leonardo in their convent while he carried on the work. After long premeditation he began, and prepared that admirable cartoon in black chalk which is now the treasured possession of the Royal Academy in London. The Virgin, partly seated on the left knee of St Anne, holds by the body the infant Christ, who leans across the figure of the elder woman, and lifts his hand in benediction of the little St John leaning against her knee. In the lines and management of the composition there is not less charm than there is research. The elder mother smiles upon her daughter, and the daughter smiles upon her child, each with a look of loving prescience and rapt self-congratulation which is the sweetest of all those mysterious expressions that Leonardo loved to seize and to perpetuate. When the cartoon was finished and exhibited, all Florence came flocking in delight to see and praise it. Between fastidiousness and preoccupation Leonardo, however, carried the undertaking no farther, and the work was put once more into the hands of Filippino Lippi, and on his death into those of Perugino. Leonardo's next great enterprise at Florence was a historical painting for the Palace of the Signory. He had been on the commission of artists appointed to determine where Michelangelo's statue of David should be placed, and now he was chosen, along with his young rival, to finish a mural picture for the new Hall of Council. Each painter chose a battle subject: Michelangelo, as is well known, the surprise of the Florentine forces in the act of bathing near Pise; Leonardo, an episode in the victory of the generals of the republic over Niccolò Piccinino at Anghiari, in the upper valley of the Tiber. In one of the sections of the *Treatise on Painting*, Leonardo has detailed at length, and obviously from his own observation, the pictorial aspects of a battle. His choice of such a subject was certainly not made from any love of warfare or indifference to its horrors. In the writings of Leonardo there occur almost as many trenchant sayings on life and human affairs as on art and natural law, and of war he has disposed in two words as a "bestial frenzy" (*paria bestialissima*). In his design for the Hall of Council, Leonardo set himself to depict this frenzy at its fiercest. He chose the moment of a terrific struggle for the colours between the opposing sides; hence the work became known in the history of art as the Battle of the Standard. Judging by the accounts of those who saw it, the tumultuous entanglement of men and horses, and the expressions of martial fury and despair, must in this case have been combined and rendered with a mastery not less commanding than had been the looks and gestures of souls' perplexity and dismay among the peaceful company on the convent wall at Milan. Leonardo had finished his cartoon in less than two years (1504-1506), and when it was exhibited along with that of Michelangelo, the two rival works seemed to all men a new revelation of the powers of art, and served as a model and example to the students of that generation, as the frescos of Masaccio in the Carmine had served to those of two generations earlier. The young Raphael is well known to have been one of those who profited by what they saw. Other Florentine artists who were especially influenced at this time by Leonardo were Fra Bartolommeo, Jacopo da Pontormo, Ridolfo del Ghirlandajo; and in sculpture Baccio Bandinelli and Rusconi. He also speaks of having among his pupils G. P. Perini called "Il Fattore," a certain Lorenzo, and a German Jacopo, who cannot be further identified.

His favourite assistant Salai had, we know, accompanied him from Milan, and remained with him.

Leonardo lost no time in proceeding to the execution of his design upon the mural surface; this time he had devised a technical method of which he regarded the success as certain, the colours were to be laid on a specially prepared ground, and then fixed by heat, in some way analogous to the processes of encaustic or enamel. When portions of the work were done the heat was applied, by means of fires lighted on platforms, but it was found to take effect unequally, and the result was a failure more or less complete. Leonardo abandoned the work in chagrin, and presently betook himself to Milan. Payments for his great battle-picture had been made to him in advance, and the gonfalonieri Piero Soderini complained on behalf of the signory that Leonardo had treated them ill. When, however, he soon afterwards honourably offered to refund the amount, the offer was not less honourably declined. The unfinished painting before long disappeared from the wall. The cartoon also, no less than the competing cartoon of Michelangelo, has perished. Our only memorials of the work are a few preliminary sketches, an engraving executed by Lucenti in 1558, not from the original but from a copy, and the far more celebrated engraving of Edelunk after a study made by Rubens, in his own essentially personal, ostentatious, un-Italian manner, of a portion only of the composition. During the years between 1500 and 1505 Leonardo was also engaged at intervals upon the portraits of two ladies of the city—Giovanna Bonci, and Lisa di Antonio Maria di Noldo Gherardini, the wife of Zanobi del Giocondo, commonly called *Mona* (i.e., Madonna) *Lisa* or *la Gioconda*. The first of these portraits is lost; the second was bought by Francis I. for four thousand gold florins, and is now one of the glories of the Louvre. In Madonna Lisa Leonardo seems to have found a sitter whose features possessed in a singular degree the intellectual charm in which he delighted, and in whose smile was realized that inward, haunting, mysterious expression which had always been his ideal. He worked, it is said, at her portrait during some portion of four successive years, causing music to be played during the sittings that the rapt expression might not fade from off her countenance, and labouring by all the means of which he was master to bring his work to perfection. It remains perhaps the most striking example of his powers. The richness of colouring on which Vasari expatiates has indeed flown, partly from injury, partly because in his preference for effects of light and shade the painter was accustomed to model his figures on a dark ground, and that in this picture the ground has to a large extent come through. Nevertheless, in its brown and faded state, the portrait is pre-eminent alike for fascination of expression, for refinement and precision of drawing, and for the romantic invention of its background, wherein a far-seen champagne with bridged rivers and winding roads is bounded by a fantastic coast of islands and rock-bound estuaries.

During these years of work at Florence, Leonardo's father died at a good old age in that city. Some stray notes, in which the painter mentions a visit to "Caterina" in the hospital, and inscribes the amount of expenses paid "for the funeral of Caterina," though they are of uncertain date, prove too that when Leonardo's peasant mother drew near her end her illustrious son was there to tend her. From his half brothers, the legitimate children of Ser Piero, Leonardo after their father's death experienced unkindness. They were all much younger than himself. One of them, who followed his father's profession, made himself the champion of the others in disputing Leonardo's claim to his share, first in the paternal inheritance, and then in that which had been left to be divided between the

brothers and sisters by an uncle. The litigation thus set on foot lasted for several years, and the annoyances attending it, with his disappointment at the failure of his great wall-painting, may have been among the causes which determined Leonardo to go back to Milan. Return thither he at all events did, with leave obtained from the signory, and attended by his faithful Salai, in the summer of 1506.

For nearly nine years after that he seems to have made the Lombard city his principal home, residing sometimes on his own vineyard and sometimes in the villa of a wealthy young friend and disciple, Francesco Melzi. The French remained in occupation at Milan until 1513, and Leonardo held the title of court painter and engineer to the French king, Louis XII., the transfer of his services having been formally requested by that monarch from the Florentine signory. The record of his occupations and performances during this period is meagre. He was several times, and for considerable periods at a time, in Florence, on business connected with the litigation above mentioned. From thence he writes at the beginning of 1511 to the French governor of Milan, asking about the payment of his salary, and saying that he means to bring with him on his return two pictures of the Madonna, of different sizes. But there can be no doubt that his thoughts became with his advancing years ever more and more engrossed in the problems of natural science. To this time belong a large proportion of the vast collections in which are accumulated the results of his observation and research.

There are only three extant pictures which we can with probability assign to this, the second Milanese period of Leonardo's career, and to what points within the period they refer. Two of these are replicas or rather variations of the same theme, the *Virgin and Child with St John the Baptist and an angel*, in a landscape of fantastic rocks and flowery grottoes by the sea-shore. The composition is known as the *Pierre aux Rochers*. The most celebrated version of it is that formerly in the collection of Francis I., and now in the Louvre. The other version was painted, according to Lomazzo, for the Cappella della Consolazione at Milan, where it was purchased in 1798 by Gavin Hamilton, and by him sold to the earl of Suffolk, from the hands of whose descendant it has lately passed into the National Gallery. Both of these paintings seem to betray signs of the handwork of the master himself, assisted probably in each case by pupils. Both have suffered, the French example most from repainting, the English most from blackening. On the whole, of these two admirable and fascinating pictures, the English example may be pronounced to be both of the higher antiquity and the greater beauty, having the advantage of the French especially in the difference of position in the right hand of the kneeling angel. The third picture conjecturally referred to about this date is also at the Louvre, and again represents a holy family. Leonardo has recurred to the motive on which he had founded his design for the Church of the Servites at Florence, in so far as he has seated the Virgin in the lap of St Anne, whom he depicts smiling at the happy intercourse of her mystic grandchild and his mother. But this time the Virgin stoops across as she sits, to lift the child from the ground on which he stands fondling a lamb. John the Baptist is absent, and the background is a pastoral landscape bounded towards the horizon by jagged mountains. The picture is unequally finished—minutely in some parts, and in others carelessly enough.

A great change took place in the affairs of Milan at the close of the year 1512. The French supremacy came to an end, and Maximilian Sforza, the son of Ludovico, returned for a few years to rule over the reduced dominions of his father. All affairs were thrown into confusion, and Milan ceased to be a desirable place of abode for Leonardo and his scholars. In the meantime Giovanni de' Medici, the son of the painter's ancient patron Lorenzo, was elected pope under the title of Leo X., and continued with still greater magnificence the encouragement of art and artists of which his walklike predecessor Julius had set the example. On the 24th September 1514 Leonardo too set out for Rome from Milan, with a company of his pupils. The youngest brother of the pope, Giuliano de' Medici, was his friend, but it is not true that Leonardo, as

Vasari says, had accompanied Giuliano to Rome on the occasion of his brother's elevation to the papal chair. Ill success attended the now ageing master during his stay in the shadow of St Peter's. He is said, indeed, to have delighted the pope, who was himself something of an alchemist, by his experiments and ingenuities in science, and especially by a kind of zoological toys, which he had invented by way of pastime, as well as mechanical tricks played upon living animals. But when, having received a commission for a picture, he was found distilling for himself a new medium of oils and herbs before he had begun the design, the pope was convinced, not quite unreasonably, that nothing serious would come of it. The hostility of Michelangelo, with whom Leonardo was in competition for the façade of San Lorenzo at Florence, may also have done something towards hindering the employment of the elder master on any important works. At all events no such employment came to him, and he seems, while he was at Rome, to have painted nothing but two small panels, one of a child, the other of a Madonna, for an official of the papal court.

By the end of the year 1515 Leonardo had left Rome and returned once more to Milan. In the meantime the brief rule of Maximilian Sforza had been terminated by the victory at Marignano of Francis I., who prevailed on Leonardo, by this time in his sixty-fourth year, to enter his service and return with him to France. It was in the beginning of 1516 that the painter crossed the Alps, taking with him his friend, the youthful Francesco Melzi. The Château Cloux in Touraine, near Amboise, was appointed for his place of residence. But his race was nearly run. In France he projected some canal works, and painted two pictures of classical mythology, which have been lost, a Leda and a Pomona; and that was all. He desired to put in order some of his vast accumulations of MS. notes and researches, but soon discovered that he who had been endeavouring so intently for all these years, in his own words, to learn to live had only been learning to die. That form of strength and beauty, and that exquisitely shaping and all-searching mind, were dissolved before decay or infirmity impaired them. Leonardo died at Cloux, in the sixty-seventh year of his age, on the 2d of May 1519. King Francis, then at his court of St Germain en Laye, is said to have wept for the loss of such a servant; that he was present beside the death-bed and held the dying painter in his arms is a familiar but an untrue tale.

The contents of our narrative will have justified the definition of Leonardo with which we set out, as a genius all but universal and a man pre-eminently great, yet great rather by power than by performance. Thus, in painting, there have come down to us no more than ten undisputed works from his hand; and among those ten are included the picture by his master Verrocchio in which Leonardo had only a share, as well as the cartoon at the Royal Academy, and the unfinished panels at the Uffizi and the Borghese gallery. Of the remaining well certified works of Leonardo, one is at the National Gallery (the Suffolk *Vierge aux Rochers*), the others are the second *Vierge aux Rochers*, the Virgin and Child with St Anne, the portrait of Mona Lisa, and the young John the Baptist, all at the Louvre. The remains of the fresco said to have been painted by Leonardo and Melzi together, in the villa which belonged to the latter at Vaprio near Milan, are too fragmentary and disputable to be counted. Of works, in addition to these, ordinarily claimed for Leonardo's hand, the best and nearest to his manner, if not actually his, is the portrait commonly known as *La Belle Ferronnière*, also at the Louvre, which students conjecture to be in reality that of the marchioness of Mantua, others that of Lucrezia Crivelli. Another highly reputed picture in the manner

of Leonardo is the *Vierge au Bas-relief* at Gaton Park; another version, however, of the same theme, said to be in no way inferior to that at Gaton, exists at Milan, and is there rightly attributed to Cesare da Sesto. The multitude of smiling daughters of Herodias, allegorical Floras, and the like, besides some admirable religious pictures (including the Christ Preaching to the Doctors, at the National Gallery), which are currently attributed in public and private galleries to Leonardo, belong really to the various pupils or imitators of his school—the greatest number to Bernardino Luini, who added to a peculiar grace and suavity of his own much of the great master's intellectual power and exquisiteness of choice and finish. Such as they are, the meagre original remains of Leonardo's craft in painting are enough to establish his place in history as the earliest complete painter of the Renaissance. In his work there are no longer to be perceived, as there are in that of all his contemporaries, any of the engaging imperfections of childhood; there is no longer any disproportion between the conception and its embodiment. He had wrestled with nature from the cradle, and for the purposes of pictorial representation had mastered her. He could draw with that ineffable left hand of his (the words are those of his friend Luca Pacioli) a line firmer, finer, and truer than has been drawn by the hand of any other man, excepting perhaps Albert Durer. Further, Leonardo carried the refinement of solid modelling in light and shade to the same high point to which he carried the refinements of linear definition. Colour he left where he found it, or rather perhaps, by his predilection for effects of light and shade, did something towards bringing about the degradation of colour. Of character and action he was an unrivalled master—preferring for his own pleasure the more far-fetched and enigmatical, sometimes even the grotesque among human types and expressions, but capable on occasion, as in his master-work of the Last Supper, of laying aside curiosity and strangeness, and treating a great theme in a great and classical spirit. If these qualities can be sufficiently discerned in the few extant paintings of this master, it is only by the study of his drawings and sketches that his industry and fertility in the graphic art can be appreciated. These are very numerous as well as very various in kind, and are widely scattered among different possessors, occurring sometimes apart from and sometimes in connexion with the sheets of his MS. notes and writings (see note below).

Passing from Leonardo's achievements in art to his attainments and inventions in science, a subject on which the present writer has no authority for speaking at first hand, it appears that, in this sphere also, the spirit of fanciful curiosity and ingenuity coexisted in Leonardo with an incomparably just and powerful grasp of natural fact and natural law. Gossiping biographers like best to speak of his mechanical birds, of his mechanical walking lion stuffed with lilies, of the lizard which he fitted with horns and artificial eyes and oscillating wings filled with quicksilver, and the like; but serious students assure us that he was one of the very greatest and most clear-sighted as well as one of the earliest of natural philosophers. They declare him to have been the founder of the study of the anatomy and structural classification of plants; the founder, or at least the chief reviver, of the science of hydraulics; to have anticipated many of the geometrical discoveries of Commandino, Autolycus, and Tartaglia; to have divined or gone far towards divining the laws of gravitation, the earth's rotation, and the molecular composition of water, the motion of waves, and even the undulatory theory of light and heat. He discovered the construction of the eye and the optical laws of vision, and invented the camera obscura. Among useful appliances he invented the saw which is still in use in the marble quarries of Carrara,

and a rope-making machine said to be better than any even yet in use. He investigated the composition of explosives and the application of steam power; he perceived that boats could be made to go by steam, and designed both steam-cannon and cannon to be loaded at the breach. He made innumerable designs for engines of war, and plans of tunnels and canals for traffic. A few of his practical inventions were carried out in his time, but both of these and of his speculative researches the vast majority, lying buried in unpublished MSS., remained after his death unknown or forgotten. The discoveries which he had made wholesale were left to be rediscovered piecemeal by the men of narrower genius who came after him.

So much for the intellectual side of Leonardo's character and career. As a moral being we are less able to discern what he was like. The man who carried in his brain so many images of subtle beauty, as well as half the hidden science of the future, must have lived spiritually, in the main, alone. Of things communicable he was at the same time, as we have said, communicative—a genial companion, a generous and loyal friend, ready and eloquent of discourse, and impressing all with whom he was brought in contact by the power and the charm of genius. We see him living on terms of constant affection with his father, tending the last hours of his mother, and in disputes with his brothers not the aggressor but the sufferer from aggression. We see him open-handed in giving, not grasping in getting—"poor," he says, "is the man of many wants", not prone to resentment—"the best shield against injustice is to double the cloak of long suffering"; zealous in labour above all men—"as a day well spent gives joyful sleep, so does a life well spent give joyful death." With these instincts and maxims, his moral experience is not likely to have been deeply troubled. In matters of religion he seems to have had some shade of the philosophical scepticism of a later age. In matters of the heart, if any consoling or any disturbing passion played a part in his life, we do not know it; we know only of affectionate relations with friends and pupils, of public and private regard mixed in the days of his youth with dazzled admiration, and in those of his age with something of reverential awe.

Of the presence and aspect of this illustrious man we have, as has been said, no record belonging to the earlier period of his life except that of the written descriptions which celebrate his beauty. The portraits which we possess represent him in after years, as he may have appeared during his second residence at Milan, when the character of sage and archmage had fully imprinted itself on his countenance. The features are grand, clear, and deeply lined, the mouth firmly set and almost stern, the eyes strong and intent beneath their bushy eyebrows, the hair long and white, descending and commingling with a majestic beard. The most authentic sheet which thus represents him is a drawing nearly in full face, unquestionably by his own hand, at Turin. Other studies, but none of such high quality as this, represent the same features in profile. On both the full-face and the profile drawings many painted portraits have been founded, some of them done by nearly contemporary hands; but none can with safety be attributed to the master himself.

The materials for a definitive life of Leonardo are at present wanting. They may be expected to be in great part supplied by the promised publication of Dr J. P. Richter's *The Literary Work of Leonardo da Vinci*. In the meantime the study of the painter (London, 1860), supplemented by his "Leonardo-Bronze" in *Ullrich's Geschichte der Malerei*, 1868, 1881, and by Ivan Lermoloff's (*St. Glor. Kordell*) in his *Verke in Leonardo's Meister in Florenz, Dresden, u. Berlin*, 1880, p. 107 sq. See also Carl Weermann in *Wilmann und Weermann, Geschichte der Malerei*, vol. II, p. 341 sq. On several matters of fact the authorities here named must be regarded as superseding all earlier biographies. The principal of these, taking them in the chronological order of their composition, are as follows: F. Jovin, "Vita Leonardo Vinci", printed in *Trionfo della Letteratura*, t. III, 1718-19, "Breve vita di Leonardo da Vinci, scritta da un Anonimo del 1600," printed by G. Milanesi in the *Archivio Storico Ital.*, 1872, p. 221 sq.; Vasari in his celebrated *Lives*, and Leonardo in his *Trattato dell'arte della pittura* (1485), and *Libro del tempo della pittura* (1490). From this time no constitution of importance was added until the work of Amoretti, which has furnished the foundation of all later biographies of Leonardo. The other chief contributions of new material have been contained in Passaghi, *Scuola di Leonardo da Vinci*, 1811, Gaye, *Catálogo di opere*, 1818, vol. I, pp. 243-251, the *Leonardatext* of Vasari, 1851, vol. VII, p. 11 sq., the new edition of the same by G. Milanesi, vol. I, p. 17 sq., G. L. Calvi, *Storia del professor di Leonardo da Vinci*, 1851, 1853, and Gust. Ullrich, *Historische Notizen u. Leonardo da Vinci*, 1853, 1872. The best general handling of the subject, antecedent to those mentioned at the beginning of our list, have been, those of G. Ardy, *Leonardo da Vinci*, 1854, and *Leonardo da Vinci*, 2d ed., Paris, 1876; and Charles Clément, *Raymond, Leonardo da Vinci, et Michelangelo*, 4th ed., Paris, 1879; in Germany, by G. F. Waagen, *Kleine Geschichte der Kunst*, 1876, W. Lohse, *Leonardo da Vinci*, 1881, and C. Bruns in *Dohme's Kunst u. Künstler*, vol. II, No. 81, in England, Mrs. Weston, *Life of Leonardo da Vinci*, London, 1874. With regard to the scientific attainments and achievements of Leonardo, the authorities are: B. Venturi, *Essai sur les ouvrages physico-mathématiques de Leonardo da Vinci*, Paris, 1797; Max Ueber M. A. Turin u. Leonardo da Vinci, Göttingen, 1848; Libri, *Storia delle Scienze Matematiche in Italia*, vol. II, Lombardini, *Dei tempi e del Progresso della Scienza Italiana*, Milan, 1872; G. Mongali, G. Gavai, and C. Belio, *Storia delle opere di Leonardo da Vinci*, Milan, 1873 (a summary of the conclusions of those writers is given in an essay by C. F. Black in *Mrs. Weston's biography*); and lastly, H. Grotte, *Leonardo da Vinci als Ingenieur u. Philosoph*, Berlin, 1874.

The celebrated *Veritas in Pictura*, which has hitherto been the only published portion of Leonardo's writings, consists of brief didactic sketches, or more properly personages, of practical dissection or critical remarks on all the branches as well as the conditions of a painter's practice. The original MS. draft of Leonardo has been lost, though a great number of sketches and fragments have been preserved in various extant volumes of his MSS. The work has been printed in two different forms, one of these is an abridged version consisting of 508 sections, the first edition of it was published in Paris in 1803, the last translated into English by J. F. Bland, in London, 1877. The other is a more extended version, an 812 sections, divided into eight books, this was printed in 1817 by Greg. Kneller at Rome, from a 17th century MS which was discovered in the Vatican Library, a German translation from the same MS, has been edited by G. H. Ludwig in *Reibberger's series of Quatzenchriften* (*Quatzenchriften*), the history of the book in general see Max Jordan, *Das Mittelalter des Leonardo da Vinci*, Leipzig, 1878.

The MSS., writings, sketches, and memoranda of Leonardo have undergone many vicissitudes since they were bequeathed in the mass by their author to his friend and nephew Francesco Melzi. Within fifty years of Leonardo's death the mass of that laborer had shivered them to pieces out of his hands, and they were in the possession partly of the sculptor Pompeo Leoni, and partly in that of Dr. Giulio Mancini. By Melzi a considerable portion of the MSS. was deposited in the Ambrosian Library at Milan. During the domination of the French under Bonaparte, these MSS. were brought to France, and the greater part of them were not restored to Milan, indeed, some of the MSS. were lost, and some of Leonardo's MSS. which he perhaps had the most valuable of them all, and is called from its title the *Codex Atlanticus*. Fourteen volumes now are in the library of the Institute at Paris. A number of other MSS. are in the library of the Louvre—the most important in the Royal Library at Windsor, some at the British Museum, and South Kensington (Pompeo Leoni), and partly in that of the Louvre and the Ambrosian Library. The well-known mass, beginning "Chi non può quel che vuol, quel che può voler," which has been quoted since the 16th century as of Leonardo's writing, is probably the work of a pupil, and which fifty years before his time (see G. Ullrich in the journal *Il Quotidiano*, 1878) (S C)

LEONIDAS ("Son of the Lion") was a very common Greek name. The most famous person who bore it was a king of Sparta, seventeenth of the Agid line. He had been king for one year when Xerxes invaded Greece, 480 a.c. The congress of the Greek states bent on resistance, which met at the Isthmus of Corinth, sent Leonidas with a force of at least 8000 men to hold the narrow pass of Thermopylae against the Persians (see GRECE). When the Persians, through the treacherous aid of Ephialtes, had turned the pass, Leonidas dismissed all his army except the 300 Spartan citizens, 700 Thespians, and the Theban contingent, which was suspected of treachery. Every man of the Lacedaemonians and Thespians died on the field, while the Thebans laid down their arms. A monument was erected on the spot where the Greeks made their final struggle. It was a lion, and we may compare with it the lion set up by the Thebans on the battlefield of Cheronnea to commemorate the sacred band who were all slain there 338 a.c. There is no foundation for the common story that Leonidas had only three hundred men with him at Thermopylae.

There were also two Greek poets named Leonidas. The elder was born at Tarentum, and lived in the time of Pyrrhus; he spent a wandering life of poverty. There remain over a hundred of his epigrams, chiefly inscriptions on works of art, or dedicatory offerings, which are among the best of their kind, showing much ingenuity of thought and cleverness of expression. The other was born at Alexandria, and came to live in Rome, where he obtained great reputation in the time of Nero. His epigrams are destitute of merit. The only ingenuity displayed in them

is that some of them have an equal number of letters in every verse.

LEONTINI, a town in the south-east of Sicily, was founded by the Chalcidians from Naxos (730 B.C.). Its history is so interwoven with that of its more powerful neighbour Syracuse that it can hardly be treated separately. The people of Leontini were more than once transferred to Syracuse, but the town was always refounded.¹ It was situated in a very fertile district, and was a wealthy place, as is proved by its numerous coins, on which ears of corn are a frequent type. The *locus classicus* for the topography of the ancient city is Polybius, vii. 6. The most distinguished name in literature belonging to Leontini is that of the sophist Gorgias. It continued to exist throughout the Roman and mediæval periods, and still preserves the old name slightly altered as Lentini.

LEOPARD, a name now commonly given to a well-known animal, called pard (*πάρος* and *πάρδαλις*) or panther (*πάνθηρ*) by the ancients. Leopard (*leo-pardus*) was a later term, originally applied, it is believed, to the animal now known as the cheetah or hunting leopard, upon the supposition that it was a creature intermediate between the lion and the true pard. If so it has been completely transferred to the more common species, and though in this sense a perfectly unnecessary and unmeaning term, has gradually superseded those by which this was originally known. *Pard*, so commonly used by Elizabethan authors, is now nearly obsolete in the English language, and panther has either become synonymous with leopard, or is used

Leopard

vaguely for any similar large feline animal, even the puma of America.

Owing to their extensive geographical range, and the great variations, both in size, form, and coloration to which leopards are subject, zoologists have scarcely decided whether all the forms popularly referred to this animal should be regarded as specifically alike, or whether they should constitute several distinct species, but the prevailing opinion at present is in favour of the former view. The attempts to separate a larger and more robust variety, under the name of panther, from a smaller and more

graceful form, to which the term leopard might properly be restricted, have failed owing to the existence of intermediate conditions which cannot be assigned definitely to either one or the other form. The most marked anatomical difference yet noted in different varieties of leopard is in the length of the tail as compared with that of the body, even the number of the caudal vertebrae showing variation, though within what limits, and whether correlated with other characters, has not yet been clearly ascertained. The fur of those specimens which inhabit the most northern confines of its range of distribution, as North China, is longer and softer, and the markings are consequently less distinct than on those from more congenial climates, and the well-marked variation thus produced has given rise to the idea of specific distinction.

Treating the species as one, it is the *Felis pardus*, Linn., of most systematic authors, belonging to the family *Felidae* (for the characters of which see MAMMALIA), and is one of the most typical members of the genus *Felis*, both in its structure and habits. It belongs to that section of the genus (which includes most of its larger members, as the lion and the tiger) in which the hyoid bone is loosely connected with the skull, owing to imperfect ossification of its anterior arch, and in which the pupil of the eye when contracted under the influence of light is crenulate, not linear as in the smaller cats. The teeth consist on each side of three small incisors, and a formidable large, conical, sharp-pointed canine above and below, and three premolars and one molar above, and two premolars and one molar below, all except the very small upper true molar with sharp compressed trenchant crowns. The skull can scarcely be distinguished, except by its inferior size, from that of the lion. There are seven cervical, thirteen dorsal, seven lumbar, three sacral, and usually twenty-three caudal vertebrae. The toes, five on the forefoot (of which the first or pollex is much shorter than the others) and four on the hind foot, are all armed with powerful, sharp-pointed, much-curved, compressed, retractile claws. The size of different individuals, as before said, varies greatly, the head and body usually measuring from $3\frac{1}{2}$ to $4\frac{1}{2}$ feet in length, and the tail from $2\frac{1}{2}$ to 3 feet, but specimens have been met with which fall short of or exceed these limits. The ground colour of the fur varies from a pale fawn to a rufous buff, graduating into a pure white on the under parts and inside of the limbs. This is spotted over with dark brown or black, the spots on the back and sides being arranged in rosettes or broken rings, which vary greatly in size and distinctness in different individuals, but are without the central spot seen in those of the jaguar. The spots on the under parts and limbs are simple and blacker than those on the other parts of the body. The bases of the ears behind are black, the tips buff. The upper side of the tail is buff, spotted with broken rings like the back, its under surface white with simple spots. The hair of the cubs is longer than that of the adults, its ground colour less bright, and its spots less distinct. Perfectly black leopards, which, however, in certain lights show the characteristic markings on the fur, are not uncommon. These appear to be examples of *melanism*, occurring as individual variations, sometimes in one cub out of a litter of which the rest are normally coloured, and therefore not indicating a distinct race, much less a species. These are met with chiefly in southern Asia. We are not aware of any recorded case from Africa, but the wild animals of that continent are not so well known.

In habits the leopard resembles the other large cat-like animals, yielding to none in the ferocity and bloodthirstiness of its disposition. It is exceedingly quick and active in its movements, but seizes its prey by waiting in ambush or stealthily approaching to within springing distance, when

¹ The restoration of the Leontine exiles was one of the alleged reasons for the Athenian expedition against Syracuse, 417 B.C.

it suddenly rushes upon it and tears it to ground with its powerful claws and teeth. It preys upon almost any animal it can overcome, such as antelopes, deer, sheep, goats, monkeys, peafowl, and is said to have a special liking for dogs. It not infrequently attacks human beings in India, chiefly children and old women, but instances have been known of a leopard becoming a regular "man-eater." When favourable opportunities occur, it often kills many more victims than it can devour at once, apparently to gratify its propensity for killing, or only for the sake of their fresh blood. It generally inhabits woody districts, and can climb high trees with facility when necessary for its safety when hunted, but usually lives on or near the ground, among rocks, bushes, and roots and low branches of large trees.

The present geographical range of the leopard is very extensive, as it is met with in various suitable localities, where not too much interfered with by human cultivation, throughout the greater part of Africa from Algeria to the Cape Colony, and through the whole of the south of Asia from Palestine to China, including all India south of the Himalayas, and the islands of Ceylon, Java, Sumatra, and Borneo. Fossil bones and teeth, indistinguishable from those of existing leopards, have been found in cave deposits of Pleistocene age in Spain, France, Germany, and England. The evidence of the former existence of the leopard in England is described at length by Boyd Dawkins and Sanford in their *British Pleistocene Mammalia* (Paleontographical Society, 1872). (W. H. F.)

LEOPARDI, GIACOMO (1798-1837), the one Italian poet of the 19th century who has taken an uncontested place among the classics of the language, was born at Recanati in the March of Ancona, June 29, 1798. All the circumstances of his parentage and education conspired to foster his precocious and sensitive genius at the expense of his physical and mental health. His family was ancient and patrician, but so deeply embarrassed as to be only rescued from ruin by the energy of his mother, who had taken the control of business matters entirely into her own hands, and whose engrossing devotion to her undertaking seems to have almost dried up the springs of maternal tenderness. Count Monsalvo Leopardi, the father, a mere nullity in his own household, secluded himself in his extensive library, to which his nervous, sickly, and deformed son had free access, and which absorbed him exclusively in the absence of any intelligent sympathy from his parents, any companionship except that of his brothers and sister, or any recreation in the dullness of Italian towns. The lad spent his days over grammars and dictionaries, learning Latin with little assistance, and Greek and the principal modern languages with none at all. Any ordinarily clever boy would have emerged from this discipline a mere pedant and bookworm. Leopardi came forth a Hellene, not merely a consummate Greek scholar, but penetrated with the classical conception of life, and a master of antique form and style. At sixteen he composed a Latin treatise on the Roman rhetoricians of the 2d century, a commentary on Porphyry's life of Plotinus, and a history of astronomy; at seventeen he wrote on the popular errors of the ancients, citing more than four hundred authors. A little later he imposed upon the first scholars of Italy by two odes in the manner of Anacreon. At eighteen he produced a poem of considerable length, the "Appressamento alla Morte," which, after being lost for many years, has recently been discovered and published by Signor Zanino Volta. It is a vision of the omnipotence of death, modelled upon Petrarch, but more truly inspired by Dante, and in its conception, machinery, and general tone offering a remarkable resemblance to Shelley's "Triumph of Life," written six years subsequently, and of which Leopardi probably never heard. This juvenile

work was succeeded (1819) by two lyrical compositions which at once placed the author upon the height which he maintained ever afterwards. The ode to Italy, and that on the monument to Dante erected at Florence, gave voice to the dismay and affliction with which Italy, aroused by the French Revolution from the torpor of the 17th and 18th centuries, contemplated her forlorn and degraded condition, her political impotence, her degeneracy in arts and arms, and the frivolity or stagnation of her intellectual life. They were the outcry of a student who had found an ideal of national existence in his books, and to whose disappointment everything in his own circumstances lent additional poignancy. But there is nothing unmanly or morbid in the expression of these sentiments, and the odes are surprisingly exempt from the failings characteristic of young poets. They are remarkably chaste in diction, close and nervous in style, sparing in fancy, and almost destitute of simile and metaphor, antique in spirit, yet pervaded by modern ideas, combining Landor's dignity with a considerable infusion of the passion of Byron. These qualities continued to characterize Leopardi's poetical writings throughout his life. A third ode, on Cardinal Mai's discoveries of ancient MSS., lamented in the same spirit of indignant sorrow the decadence of Italian literature. The publication of these pieces widened the breach between Leopardi and his father, a well-meaning but apparently dull and apathetic man, who had lived into the 19th century without imbibing any of its spirit, and who provoked his son's contempt by a supposition unpardonable in a scholar of real learning. Very probably from a mistaken idea of duty to his son, very probably, too, from his own entire dependence in pecuniary matters upon his wife, he for a long time obstinately refused Leopardi funds, recreation, change of scene, everything that could have contributed to combat the growing pessimism which eventually became nothing less than monomanical. The affection of his brothers and sister afforded him some consolation, and he found intellectual sympathy in the eminent scholar and patriot Pietro Giordani, with whom he assiduously corresponded at this period, partly on the ways and means of escaping from "this hermitage, or rather seraglio, where the delights of civil society and the advantages of solitary life are alike wanting." This forms the keynote of numerous letters of complaint and lamentation, as touching but as effeminate in their pathos as those of the banished Ovid. It must be remembered in fairness that the weakness of Leopardi's eyesight frequently deprived him for months together of the resource of study. At length (1822) his father allowed him to repair to Rome, where, though cheered by the encouragement of Bunsen and Niebuhr, he found little satisfaction in the trifling pedantry that passed for philology and archeology, while his sceptical opinions prevented his taking orders, the indispensable condition of public employment in the papal states. Dispirited, and with exhausted means, he returned to Recanati, where he spent three miserable years, brightened only by the production of several more lyrical masterpieces, which appeared in 1824. The most remarkable is perhaps the *Bruto Minore*, the condensation of his philosophy of despair. In 1825 he accepted an engagement to edit Cicero and Petrarch for the publisher Stella at Milan, and took up his residence at Bologna, where his life was for a time made almost cheerful by the friendship of the countess Malvezzi. In 1827 appeared the *Opere Morali*, consisting principally of dialogues and his imaginary biography of Filippo Ottonieri, which have given him a fame as a prose writer hardly inferior to his celebrity as a poet. Modern literature has few productions so eminently classical in form and spirit, so symmetrical in construction and faultless in style. Lucian is evidently

the model; but the wit and irony which were playthings to Lucian are terribly earnest with Leopardi. Leopardi's invention is fully equal to Lucian's, and his only drawback in comparison with his exemplar is that, while the latter's campaign against pretence and imposture commands hearty sympathy, Leopardi's philosophical creed is a repulsive hedonism in the disguise of austere stoicism. His Icelandic rebuking Nature for his cruelty and inhospitality, his Soul protesting against the original wrong of creation, his Familiar Spirit explaining the impossibility of making his master happy for a single instant—all, in fact, of the chief interlocutors in these dialogues profess the same unmitigated pessimism, claim emancipation from every illusion that renders life tolerable to the vulgar, and assert or imply a vast moral and intellectual superiority over unenlightened mankind. When, however, we come to inquire what it is the privation of which renders them miserable, we find it is nothing but pleasurable sensation, fame, fortune, or some other external thing which a lofty code of ethics would deny to be either indefinitely due to man or essential to his felicity. A page of *Sartor Resartus* scatters Leopardi's sophistry to the winds, and leaves nothing of his dialogues but the consummate literary skill that would render the least fragment precious. As works of art they are a possession for ever, as contributions to moral philosophy they are worthless, and apart from their literary qualities can only escape condemnation if regarded as lyrical expressions of emotion, the wail extorted from a diseased mind by a diseased body. "Filippo Ottomani" is a portrait of an imaginary philosopher, imitated from the biography of a real sage in Lucian's *Demonax*. Lucian has shown us the philosopher he wished to copy; Leopardi has truly depicted the philosopher he was. Nothing can be more striking or more tragic than the picture of the man superior to his fellows in every quality of head and heart, and yet condemned to sterility and impotence because he has, as he imagines, gone a step too far on the road to truth, and illusions exist for him no more. The little tract is full of remarks on life and character of surprising depth and justice, manifesting what powers of observation as well as reflection were possessed by the sickly youth who had seen so little of the world.

Want of means soon drove Leopardi back to Recanati, where, deaf, half-blind, sleepless, tortured by incessant pain, at war with himself and every one around him except his sister, he spent the two most unhappy years of his unhappy life. In May 1831 he escaped to Florence, where he formed the acquaintance of a young Swiss philologist, M. de Sinner. To him he confided his unpublished philosophical writings, with a view to their appearance in Germany. Sinner showed himself culpably remiss in the execution of his trust, and it is no adequate extenuation of his negligence that these treatises were of less value than Leopardi may have thought. Though continually reclaimed by the latter's friends after his death, they were never published by Sinner, but were purchased after his decease by the Italian Government, and, together with Leopardi's correspondence with the Swiss philologist, have been partially edited by M. Aulard. In 1831 appeared a new edition of Leopardi's poems, comprising several new pieces of the highest merit. These are in general less austere than his earlier compositions, and evince a greater tendency to description, and a keener interest in the works and ways of ordinary mankind. "The Resurrection," composed on occasion of his unexpected recovery, is a model of concentrated energy of diction, and "The Song of the Wandering Shepherd in Asia" is one of the highest flights of modern lyric poetry. The range of the author's ideas is still restricted, but his style and melody are unsurpassable. Shortly after the publication of these pieces

(October 1831) Leopardi was driven from Florence to Rome by an unhappy attachment, the history and object of which have remained unknown. His feelings are powerfully expressed in two poems, "To Himself" and "Aspasia," which seem, however, to breathe wounded pride at least as much as wounded love. In 1832 Leopardi returned to Florence, and there formed acquaintance with a young Neapolitan, Antonio Ranieri, himself an author of merit, and destined to enact towards him the part performed by Severn towards Keats, an enviable title to renown if Ranieri had not in his old age tarnished it by assuming the relation of Telralway to the deceased Byron. Leopardi accompanied Ranieri and his sister to Naples, and under their care enjoyed four years of comparative tranquillity. He made the acquaintance of the German poet Platen, his sole modern rival in the classical perfection of form, and composed "La Ginestra," the most consummate of all his lyrical masterpieces, strongly resembling Shelley's "Mont Blanc," but more perfect in expression. He also wrote at Naples "The Sequel to the Battle of the Frogs and Mice," his most sustained effort, a satire in ottava rima on the abortive Neapolitan revolution of 1820, clever and humorous, but obscure from the local character of the allusions. The more painful and disastrous details of his Neapolitan residence may be found by those who care to seek for them in the deplorable publication of Ranieri's posthumous age (*Sette anni di Sordani*). The decay of his constitution continued; he became dropsical, and a sudden crisis of his malady, unanticipated by himself alone, put an end to his life-long sufferings on June 18, 1837.

Leopardi's sole but sufficient apology for the effluency of emotions complained of, and at the same time the condition of his happiness, is to have been a poor invalid tortured by incessant pain, who in demanding pleasurable sensations for mankind was but craving what was indeed an absolute necessity for himself. With all his dramatic skill in dialogue, the cast of his mind was essentially subjective; he was wholly incapable of placing himself at any other point of view than his own. His philosophical opinions accordingly possess merely a personal interest, and are valueless except as illustrations of human nature in abnormal circumstances. The patriotic spirit of his earliest poems, the brief gleam of happiness he enjoyed in female society at Bologna, never, however, might have been his history and the spirit of his writings had his physical organization qualified him for either love or action. Devoid of every possibility of healthy energy, it is no wonder that he should have sunk into a despairing quietism, a solace probably to himself, and only harmful to others if represented as a powerful intellect's deliberate and unhesitant solution of the problem of the universe. Leopardi's perfect literary expression owes nothing to the nature of the ideas it is employed in embellishing, and is, indeed, most conspicuous when he stands upon common ground with other poets. Thus the magnificent description of the setting of the moon in "Il Trionfo della Luna" is finer than the reflections it evokes in, and his crowning work, "La Ginestra," owes most of its impressiveness to the assemblage of noble and picturesque objects which the poet summons as witnesses to the frailty of man. In the presence of Vesuvius and Pompeii such meditations seem natural, and, after all, the association of the destitution of mankind with the revolutions of nature produces rather a sentiment of grave and chastened exaltation than the self-abasement enforced by the poet. This natural and moral sublimity raises it above Leopardi's other lyrics, which in point of poetical feeling and literary workmanship are for the most part worthy on a par. They are truly classic—not as was Platen, by a laborious imitation of antique metres, but, as with Shelley and Landor and the English neo-classic poets, by a perfect appropriation of the classical spirit. As with the ancients, their range of sentiment is narrow but their form perfect; there is probably no other modern writer in whom it would be so impossible to alter a line without detriment. The same perfection characterizes Leopardi's prose writings, and his letters would be hardly less admirable but for the hollow professions and inflated compliments exalted by the conventional pretences of Italian correspondence. The instability of his letters to his father is especially painful; and his professed yearning for death is strangely associated with a frenzied dread of cholera. Censure, however, is silent in the contemplation of his moral and physical sufferings; and his intimates unanimously attest the attractiveness of his personal character save for some infirmities that should never have been dragged to light. As a precocious

and at the same time enduring genius he can only be compared to Pascal, whom he greatly resembles in many respects.

The poems which constitute Leopardi's principal title to immortality are only fifty-one in number, and some of these are merely fragments. They may for the most part be described as odes, meditative soliloquies, or impassioned addresses, generally couched in a lyrical form, although a few are in magnificent blank verse. Some idea of the style and spirit of the former might be obtained by imagining the thoughts of the last book of Spenser's *Faerie Queene* in the metre of his *Euphonia*. They were first edited completely by Bemeti at Florence in 1846, forming, along with the *Opere Morali*, the first volume of a proposed edition of Leopardi's works, which does not, however, include the "Sonnet to the Battle of the Frigo and Miso," first printed at Pisa in 1842, nor the recently discovered writings. Vols. II-IV contain the philosophical essays and translations, with some letters, and vols. V and VI the remainder of the correspondence. The juvenile essays preserved in his father's library at Recanati were edited by Guignou in 1874, with the consent of the family. Leopardi's biography is mainly in his letters, which his recent historians (Brandes, Ronché-Leclercq, Koss) have merely wrought up with the addition of criticisms, excellent in their way, more particularly Brandes's, but generally much overrating his significance in the history of human thought. In Gladstone's essay (*Guard. Rev.*, 1890), since reprinted in vol. IV of the author's *Gleanings*, 24, on the other hand, too much pervaded by the theological spirit, but in the main a pattern of generous and discriminating eulogy. Baurer's infelicitous contribution to his friend's biography has been mentioned, a recent publication by the countess Teresa Leopardi, widow of Leopardi's brother Carlo, has done much to correct misconceptions respecting the circumstances and feelings of his family. There are excellent German translations of his poems by Heyse and Brandes, it is very improbable that there will ever be an adequate one in English. A translation of his essays and dialogues by Mr. G. Edwards has, however, just appeared (1882), and most of the dialogues have been rendered into our language with extraordinary felicity by Mr. James Thomson, author of *The City of Dreadful Night*. It is much to be hoped that these versions may at last be disseminated from the files of the *National Examiner*, and made generally accessible. (R. G.)

LEOPOLD I. (1640-1705), Holy Roman emperor, the second son of the emperor Ferdinand III and Maria Anna of Spain, was born June 9, 1640. He became king of Hungary in 1655, and king of Bohemia in 1658, in which year he also received the imperial crown, the electors having chosen him in preference to Louis XIV. of France. Leopold had been educated for the church, and throughout life he had the tastes and sympathies of a churchman rather than those of a secular ruler. He secluded himself as much as possible from the world, and would have preferred to live in peace, yet his long reign was destined to be one of the most agitated periods in German history. It happened that he had in Louis XIV. a rival of extraordinary power, and Leopold was in no respect a match for his craft, ambition, and audacity. The serious difficulties of Leopold's career began in 1682, when the mismanagement of his ministers in regard to Transylvania made war with Turkey inevitable. The Turks invaded Hungary, and, having seized Grosswarden and Neuhausel, broke into Moravia and Silesia. The princes of the empire, who had been made virtually independent by the results of the Thirty Years' War, watched the progress of the struggle with indifference; but in 1683, Leopold having made a personal appeal to them in the diet at Ratibon, they were induced to grant him aid. On the 1st of August 1684 Montecuculi defeated the Turks at St. Gotthard on the Raab, and had the war been prosecuted with energy much future disaster would probably have been prevented. The emperor, however, made no further use of his victory than to induce the Turks to accept an armistice for twenty years. He allowed them to retain Grosswarden and Neuhausel, and their candidate for the principality of Transylvania was formally recognized. In 1672 Leopold came for the first time into direct collision with Louis XIV. As it seemed highly probable that the French king would not be content with the conquest of Holland, Leopold, as head of his hereditary territories and as emperor, associated himself with Brandenburg and Spain for the support of the Dutch.

For some time, in consequence of the intrigues of Prince Lobkowitz, the emperor's minister, the war was conducted indolently by the Germans; and early in 1675 Turenne gained a series of brilliant victories in Alsace. Later in the same year Turenne was slain, and his army defeated at Salsbach, and Montecuculi forced his way across the French frontier. The treaty of Nimueguen having been signed by the Dutch in 1678, the emperor concluded peace in 1679. The French retained Fleisburg in Breisgau; and soon afterwards Louis XIV., instead of giving up towns which he had undertaken to resign, seized many new cities and districts. To these acts of robbery he gave an appearance of legality by instituting so-called "Chambéis of Reunion." The German people bitterly resented his aggression, but the princes declined to interfere, and the energies of the emperor were fully occupied elsewhere. His system of government in Hungary was arbitrary and tyrannical, and in 1682 the Hungarians, headed by Emeric Tokolyi, broke into open revolt. They were encouraged by Louis XIV., who stirred up the Turks to join them in attacking Austria. In 1683 a Turkish army of 200,000 men, led by the grand vizier Kara Mustapha, entered Hungary, and pushed on to Vienna, which they besieged from the 14th of July till the 12th of September. The German princes were unwilling to act even in such an emergency as this, but at last an imperial army under the electors of Bavaria and Saxony marched towards Vienna, and they were joined by John Sobieski of Poland with a corps of 28,000 men. These troops, in association with the emperor's army under Duke Charles of Lorraine, attacked the Turks on the 12th of September 1683, at the Kahlenberg, near Vienna. The Turks were so effectually defeated that they were soon driven from Hungary. Another great victory was gained over them at Mohacz in 1687, and in 1697 they were defeated by Prince Eugene at Zenta. In 1699 the treaty of Carlowitz was signed, whereby the emperor became complete master of the districts which the Turks had conquered in Hungary. Twelve years before (1687), the Hungarians, worn out by the struggle, had submitted to the emperor at the diet of Piesburg, the monarchy being made hereditary in the house of Hapsburg instead of elective. This settlement had scarcely been concluded when the emperor was involved in new troubles by the French invasion of the Palatinate in 1688. On this occasion Louis XIV. had to account with an antagonist of a very different character from the emperor Leopold. William of Orange, who raised to the throne of England, made it the object of his life to break the supremacy of France; and through his efforts was formed the Grand Alliance, which for more than eight years carried on war by sea and land. The emperor did not approve of the treaty of Ryswick (1697), but after the withdrawal of his allies he had no alternative but to consent to the establishment of peace. Louis was compelled to cede most of the acquisitions he had made after the treaty of Nimueguen, but retained Strasburg. In 1701 began the war of the Spanish succession, waged by Leopold in defence of the claims of his second son Charles against those of Philip of Anjou, grandson of Louis XIV. In this war Leopold was supported by the empire, and by England, Holland, and Prussia. It opened with several victories gained by Prince Eugene; but afterwards King Joseph and the margrave of Baden were repeatedly defeated, and the emperor was weakened by a renewal of the movement for national independence in Hungary. His confidence was revived by the battle of Blenheim, but he did not live to see the full results of that great victory. On the 5th of May 1705 he died of dropsy in the chest. He was a man of ungainly appearance, the most prominent feature of his face being his large hanging under-lip. The life of his court

was regulated in accordance with the strictest rules of Spanish etiquette, but in his relations to his family a naturally kind disposition often broke through the crust of rigid conventions. Although one of the most intolerant sovereigns of his age, he gave considerable attention to science, and took a prominent part in the establishment of the universities of Innsbruck, Olmutz, Halle, and Breslau. Early in his reign he allowed his judgment to be controlled by his cabinet, but he never placed implicit trust in any minister after the discovery that Lobkowitz had been in communication with the French. He was married three times, and two of his sons became emperors—Joseph I. and Charles VI. (v. si.)

LEOPOLD II., Holy Roman emperor, was born on the 5th of May 1747. After the death of his father, the emperor Francis I., in 1765, he became grand-duke of Tuscany, a country which he ruled for twenty-five years in a thoroughly enlightened spirit. Earlier than his brother, Joseph II., he saw the necessity of ecclesiastical reform, but he effected with moderation and good sense the changes which he considered advisable. Agriculture, industry, and commerce he encouraged in accordance with the ideas of his age, and Tuscany owed to him a well-conceived criminal code. He had even prepared a scheme for instituting representative government in Tuscany when, in 1790, he succeeded Joseph II. in the hereditary lands of the house of Hapsburg and in the empire. Joseph, with all his good intentions, had left his hereditary states in much confusion, and vigour and prudence were essential for the re-establishment of order. The chief difficulty was in the Netherlands, which were disinclined to respond to Leopold's advances. He despatched an army against them, and it entered Brussels on the 3d of December 1791. The country was then at his mercy; but he acted with great discretion, restoring certain ancient rights which Joseph, in his zeal for improvement, had withdrawn. In Hungary, too, the emperor succeeded in calming popular excitement; and on the 4th of August 1791 the treaty of Sistova was signed, bringing to an end the unlucky war which Joseph had waged with the Turks. The violence of the French Revolutionists produced a bad effect on the internal policy of Leopold, who supposed that it was necessary, not only to introduce a secret police, but to limit the freedom of the press. The same influences led him to conciliate Prussia, which had been always on its guard against Austria since the establishment of the Confederation of Princes by Frederick the Great. On the 27th of August 1791 the emperor and the king of Prussia met at Pillnitz; and it was agreed that they should act together for the deliverance of Louis XVI. of France. In pursuance of this understanding a defensive and offensive treaty of alliance between Austria and Prussia was concluded on the 7th of February 1792; but the emperor's schemes were suddenly broken by death. He died on the 1st of March 1792, and was succeeded by his son, the emperor Francis II.

LEOPOLD I. (1790–1865), king of the Belgians, was the fourth son of Francis, duke of Saxe-Coburg-Saalfeld, and thus the uncle of Queen Victoria of England. His youth was chiefly spent in the Russian military service; he commanded a battalion at Lützen, Bautzen, and Leipzig, entered Paris with the allied sovereigns, and accompanied them to England. In May 1815 he married the Princess Charlotte, only child of the Prince Regent (who died in the following year), having previously been created duke of Kendal in the English peerage. In 1830 he declined the crown of Greece, but was elected to the throne of Belgium in June 1831. For the subsequent events of his life see BELGIUM, vol. iii. p. 528 sq.

LEOPOLD I. (1676–1747), duke of Anhalt-Dessau, *der alte Dessauer*, a famous Prussian general, was born at

Dessau, July 3, 1676. Possessing great physical energy and an absorbing interest in military affairs, he at an early age displayed capacity for commands of high responsibility. On the death of his father in 1693 he succeeded him as colonel of a regiment in the service of Brandenburg, and, having rendered invaluable assistance at the capture of Namur by William III. of Orange in 1696, he obtained the rank of major-general. Returning shortly afterwards to his principality, he conceived a passionate attachment for the daughter of an apothecary, whom he raised to the rank of nobility and made his wife on reaching his majority. During the years that he now spent in his principality, he won the ardent affection of the mass of the people, both by his considerate regard for their welfare and by the influence of his strong personality. In command of a division of twelve thousand men at Bielefeld in 1704, Leopold so acted in a critical contingency as practically to turn the scales of victory, and in Eugene's Italian campaigns he was conspicuous at the battle of Cassano in 1706, the storming of Turin in 1706, and in other affairs of minor importance. After serving as a volunteer at Malplaquet in 1709, he received an independent command from Prussia, and rendered important assistance to Marlborough against Villars. Created field-marshal in 1715, he gained the special confidence of Frederick William I., and it was in no small degree to his instructions in military tactics, and the splendid perfection to which he had brought the small army of Prussia, that the great military triumphs of Frederick II. were due. His more important military inventions are the iron ram-rod and the equal step. As a general he specially excelled in stratagems and surprises, in which he was greatly aided by his daring and impetuous energy. These qualities were specially displayed in the surprise and bloodless capture of Mors castle in 1712, the seizure during night of the island of Rugen in 1715, the formation in 1741 of the famous entrenched camp at Götting near Magdeburg, where with an army of thirty-six thousand men he was prepared for events either in Saxony or Hanover, the defeat of the Austrians at Neustadt in 1744, and the expulsion of the Saxons, though superior both in numbers and artillery, from a strongly entrenched position at Kesselsdorf in 1745. He died 7th April 1747. Leopold is graphically portrayed in Carlyle's *Frederick*, where he is spoken of as "a man of vast dumb faculty, dumb but fertile, deep—no end of imagination, no end of ingenuities—with as much mother wit as in whole talking parliaments."

LEPANTO (the Italian form of the modern Greek *Epakto*), known in ancient times as Naupactus, a name which has recently been revived in official documents, is a town in the nomarchy of Achaïa and Ætolia, Greece, situated on a bay on the north side of the straits of Lepanto, by which the gulf of the same name is connected with that of Patras. It stands on the south-eastern and southern slopes of one of the spurs of Mount Rigan; the surrounding plain is well watered and fertile, but the harbour, once the best on the northern coast of the Corinthian Gulf, is now almost entirely choked up, and is accessible only to the smallest craft. Lepanto is an episcopal see; the population of the deme of Naupactus in 1879 was 5298.

According to traditional etymology, Naupactus derived its name from the circumstance that here the Heracleids built the fleet with which they expelled the Peloponnesians. The place is first mentioned in actual history as having been taken from the Lœvi Ozolæ by the Athenians, who settled it with Messenian helots at the close of the third Messenian war (455 B.C.), and who made it their chief military and naval station in western Greece during the war of the Peloponnesians. After Agamemnon it was successively held by the Locrians, Achæans, and Ætolians, and finally, after a siege of two

months, it fell into the hands of the Romans, 191 a.c. It was still a flourishing place in the time of Pausanias, but according to Ptolemy it was destroyed by an earthquake in the reign of Justinian. In the Middle Ages it fell into the hands of the Venetians, who fortified it so strongly that in 1477 it successfully resisted a four months' siege by a Turkish army thirty thousand strong. In 1499, however, it was taken by Bajazet II. The south of the Gulf of Lepanto was the scene of the great sea fight in which the naval power of Turkey was for the time being destroyed by the united naval, Spanish, and Venetian forces (October 7, 1571). See JONK OF AUSTRIA. In 1678 it was recaptured by the Venetians, but was again restored in 1696 by the treaty of Calovista to the Turks; it was the year of independence it finally became Greek once more (March 1830).

LEPIDOSIREN is the name of one of the most remarkable genera of fishes, of which one species (*Lepidosiren paradoxa*) has been found in tributaries of the river Amazon, and the other (*Lepidosiren annectens*) occurs in the systems of all the large rivers of tropical Africa. The latter species differs in some points, notably in having six instead of five branchial arches, from *L. paradoxa*, and therefore has been generally separated by Owen under the name of *Protopterus*,—which name likewise is in common use. Together with the Australian *Ceratodus*, the lepidosirens are the only living representatives of a very old type of fishes, the *Dipnoi*, which reaches back to the Devonian age, thus giving us an insight into the organization of fishes of which nothing but some obscure and fragmentary impressions of the hard parts are preserved. The body of *Lepidosiren* is eel-shaped, and covered with small thin scales. A single vertical fin surrounds its posterior part of the body and the tail; the paired fins are reduced to two pairs of long threads, internally supported by a series of small cartilages. The dentition is very characteristic, and consists of a pair of conical pointed vomerine teeth, and a pair of large cuspidate and ribbed molar teeth on the palate and in the lower jaw. The skeleton is notochordal; and lungs are present in addition to gills. From this latter fact it may be inferred that the lepidosirens can breathe air as well as water; and, although they have never been observed to leave the water voluntarily, either in a state of nature or in captivity, they rise from time to time to the surface to fill their lungs with a fresh supply of air; further, when, during the hot season, the water of the tanks in which they live changes into mud, branchial respiration is entirely superseded by pulmonary. Of the habits of *Lepidosiren paradoxa* scarcely anything is known; only a few specimens have been found by naturalists, and neither Bates nor Wallace succeeded in obtaining one. This species, therefore, is one of the greatest desiderata in zoological museums. The African species, on the other hand, is common in the upper Nile, in the central lake-region, on the Zambesi, and in all the rivers of the west coast. Baker states that in some districts of central Africa the lepidosirens is so abundant as to form an article of food, fresh and dried. Specimens living in pools which dry up during the hot season bury themselves in the mud, and form an oval cavity, the inside of which is lined with a protecting coat of hardened mucus, and in which they wait, coiled up and in a torpid condition, for the return of the rainy season. These retreats are discovered by the natives by a circular opening at the upper surface, which is closed by the mucous film. If the capsules are not broken, the fishes, imbedded in the clay-balls, can be transported to Europe, and emerge from their prison on being placed in tepid water. Both species attain to a length of 6 feet, and feed on frogs, fishes, and other of aquatic animals. For the details of the organization the *Lepidosiren* see the article ICHTHIOLOGY.

LEPIDUS, M. *ÆMILIUS*, a member of the second Roman triumvirate, was a son of M. *Æmilius* Lepidus, who had been consul in 137 a.c. He joined the party of Cæsar

in the civil wars, and was by the dictator thrice nominated *magister equitum* and raised to the consulship 46 a.c. He was a man of great wealth and influence, and it was probably more on this ground than on account of his ability that Cæsar raised him to such honours. In the beginning of 44 a.c. he was sent to Gallia Narbonensis, but before he had left the city with his army Cæsar was murdered. Lepidus, as commander of the only army near Rome, became a man of great importance in the troubles which followed. Taking part with Antony, he joined in the reconciliation which the latter effected with the senatorial party, and afterwards sided with him when open war broke out, and Antony, after his defeat at Mutina, joined Lepidus in Gaul, and in August 43 a.c. Octavian, who had forced the senate to make him consul, effected an arrangement with Antony and Lepidus, and the triumvirate was organized at Bononia. Antony and Octavian soon reduced Lepidus to an inferior position. His province of Gaul and Spain was taken from him; and, though he was included in the triumvirate when it was renewed in 37 a.c., his power was only nominal. He made an effort in the following year to regain some reality of power, conquered part of Sicily, and claimed the whole island as his province, but Octavian found means to sap the fidelity of his soldiers, and he was obliged to supplicate for his life. He was allowed to retain his fortune and the office of *pontifex maximus*, to which he had been appointed in 44 a.c., but had to retire into private life. He died 13 a.c.

Lepidus was the cognomen of a Roman family in the patrician *gens Æmilia*. The first of this name of whom anything is recorded is M. *Æmilius* Lepidus, consul 385 a.c. From this time onwards the family continued in an almost unbroken series of distinguished men till in the 1st century after Christ it disappears. Another M. *Æmilius* Lepidus was one of the three ambassadors sent to Egypt as *legates* of the infant king Ptolemy. He was consul in 157 and 176, censor 179, *pontifex maximus* from 160 onwards, and was six times chosen by the censors *prætor senatus*. He died in 162. It is uncertain whether he is the Lepidus who is commemorated on a coin of the *gens Æmilia* as having slain an enemy and saved a citizen's life at the age of fifteen, while still dressed in the boy's *togæ prætextæ*. Another of the Lepidi was C. Lepidus, 137 a.c. Being sent to Spain to conduct the Numantine war, he began against the will of the senate to attack the Væcæ. This enterprise was so unsuccessful that he was deprived of his command in 130 and condemned to pay a fine. He was among the greatest of the earlier Roman orators, and Cicero praises him for having introduced the well-constructed sentence and given flow of language from Greek into Roman oratory. He contributed much to forming the style of Tiberius Gracchus.

Another of the same name was infamous for his aggressive pretensions in Sicily (81 a.c.). In the civil wars he sided with Sulla and bought much of the confiscated property of the Marian partisans. Afterwards he became leader of the popular party, and was with the help of Pompey elected consul for 78 a.c., against the will of Sulla. When the dictator died, Lepidus tried in vain to prevent the burial of his body in the Campus Martius, and to alter the constitution established by him. His colleague Lucius Cælius found a pretext to place his veto on Lepidus's proposals; and the quarrel between the two parties in the state became so inflamed that the senate made the consuls swear not to take up arms. Lepidus was then ordered by the senate to go to his province, Transalpine Gaul; but he stopped in Etruria on his way from the city, and began to levy an army. He was declared a public enemy early in 77 a.c., and forthwith marched against Rome. A battle took place in the Campus Martius, Pompey and Cælius commanding the senatorial army, and Lepidus was defeated. He sailed to Sardinia, where he was also repulsed; and soon after he died. One of his two sons was L. *Æmilius* Paulus, consul 69, who built during his childhood in 66 the Basilica *Æmilia* in the forum.

LEPROSY (*Lepra Arabum*, *Elephantiasis Græcorum*, *Ausatz*, *Spedalkheit*), the greatest disease of mediæval Christendom, is identified, on the one hand, with a disease endemic from the earliest historical times (1500 a.c.) in the delta and valley of the Nile, and on the other hand with a disease now common in Asia, Africa, South America, the West Indies, and certain isolated localities of Europe. An authentic representation of the leprosy of the

Middle Ages exists in a picture at Munich by Holbein, painted at Augsburg in 1516; St Elizabeth gives bread and wine to a prostrate group of lepers, including a bearded man whose face is covered with large round reddish knobs, an old woman whose arm is covered with brown blotches, the leg swathed in bandages through which matter oozes, the bare knees also marked with discoloured spots, and on the head a white rag or plaster, and, thirdly, a young man whose neck and face (especially round the somewhat hairless eyebrows) are spotted with brown patches of various size. It is conjectured by Virchow that the painter had made studies of lepers from the leper-houses then existing at Augsburg. These external characters of mediæval leprosy agree with the descriptions of it by the ancients, and with the pictures of modern leprosy given by Danielsen and Boeck for Norway, by various authors for sporadic European cases, by Anderson for Malacca, by Carter for India, by Wolff for Madeira, and by Hillis for British Guiana. There has been some confusion in the technical naming of the disease; it is called *Elephantiasis* (*Leontiasis*, *Satyriasis*) by the Greek writers, and *Lepros* by the Arabians. The latter term has been generally adopted in modern books, but in England the name of *Lepros* is applied (after Willan) to an entirely different disease of the skin.

History.—Egypt was regarded by the ancients (positively by Lucretius) as the country whence leprosy came. It was probably endemic among the Hebrews when they migrated from Egypt. The minute diagnostic indications given in Lev. xii. appear to relate to true leprosy and to other diseases that might be mistaken for it, and the frequently recurring word *Sār'a'ath* (translated "leprosy") is best taken in a generic sense; those cases in which progress would show itself at so short intervals as seven days, and those cases for which the ceremonial of cleansing was provided, could hardly have been cases of leprosy, a disease always incurable, and with stages reckoned rather by months or years than by weeks. Herodotus knew of leprosy as existing in Persia. The earlier Greek and Latin writers speak of it as a foreign disease, but it became established in Greece and Italy in the 1st century A.C.; Pliny implies that it was introduced by the army of Pompey returning from Syria. The disease soon appeared in the Roman colonies of Spain, Gaul, and Britain. The Lombard king Rothar (7th century) made laws regulating the marriage of lepers, and similar laws were made by Pippin and Charlemagne. Leprosy-houses existed at Verdun, Metz, and Maestricht in the 7th century, at St Gall in the 8th, and at Canterbury in the 11th. It was amidst the stir and movement of the crusades that leprosy grew to be epidemic in western Europe; it attacked the people in great numbers and in all ranks (including members of royal families). Leprosy-houses (mostly religious and dedicated to St Lazarus, but in northern Europe more secular and dedicated to St George) were founded in every considerable town; the total number of these in Europe was loosely estimated by Matthew Paris at 19,000, the number in France is independently estimated at 2000, and (according to Sir J. Y. Simpson) there were 95 houses of the first class in England (of these 7 at Norwich and 5 at Lynn), and several in Ireland and Scotland. The isolation of lepers was strictly enforced by law and popular sentiment. They wore a special costume, usually a long grey gown with hood drawn over the face, and carried a wooden clapper to give warning of their approach. They were forbidden to enter inns, churches, mills, or bakehouses, to touch healthy persons or eat with them, to wash in the streams, or to walk in narrow footpaths. Their outcast state was signified by the German name (*Aussatz*); the Chronicle of Limburg (under the year 1374) speaks of a

famous monkish poet, whose songs all Germany was singing, as one "*der ward von den Leuten aussatzig, und war nicht rein*." The disease began to decline (first in Italy) in the 15th century, and had mostly disappeared in the 17th. A leprosy-house was founded in Edinburgh (at Greenside) as late as 1591, and it was not till 1741 (others give 1798) that the last known leper died in Shetland.

Present Geographical Distribution.—Survivals of the great mediæval outbreak are found on the west coast of Norway (about two thousand lepers, leper hospital at Bergen founded 1277, now added to), in the Baltic provinces of Russia (leper hospitals founded at Riga in 1220 and Revel 1237, not now in use), on the Riviera (a small and diminishing number), on the Sicilian coasts, and in certain coast provinces of Spain and Portugal (leper hospital at Lisbon since the 13th century). Sporadic cases of home origin have also been described for Hungary and Roumania; the cases occurring in England and France are in persons who have been born or have lived in the East or West Indies. The disease is met with also in Iceland, along the Caspian and delta of the Volga, along the Black Sea, and in islands of the Levant (especially Scio and Crete). It is common all over the East from Syria to Japan and Kamohatke, in Egypt and North African states, in West Africa from the Senegal to the Congo, in Cape Colony, Madagascar, Mauritius, Isle de Bourbon, St Helena, Madeira, Canaries and Azores, Brazil, Central America, the West Indies, Mexico, New Brunswick (small isolated French colony), and especially in the Hawaiian Islands. Leprosy has been found among Chinese immigrants in the United States as far east as Chicago, and in Queensland. Leprosy hospitals (with inmates numbering from two hundred downwards) are kept up in several of the West Indian colonies, at Tracadie (New Brunswick), at Cape Town, in Mauritius, at Malacca and Singapore, at Colombo, at Madras, Coclén, and Bangalore, at Bombay and Rajkot, and at Calcutta, Benares, and Agra. There are also leper hospitals at Bergen (3), Molde, and Trondhjem, at San Remo, at Oporto, Coimbra, and Lisbon, at Terceira (Azores), Las Palmas (Grand Canary) since 15th century, and Funchal (Madeira) since about 1500, at Pernambuco, Bahia, and Rio, at Honolulu, at Macao (for two hundred years) and Canton, in Java (several) and in Amboyna, at Scio (since 1445), Scutari, Damascus, and Jerusalem. A ruined convent at Ramleh accommodates thirty lepers or more, and a mosque at Nablus is occupied by about seventy. In several of the above instances the leper hospital is built upon an outlying island. Leprosy villages occur in China and Japan, and in Persia. Leprosy communities exist in Crete, but the largest of them is now mostly occupied by a non-leprosy population. Throughout the East, including British India, the hospital accommodation for lepers is only casual, and isolation is not carried out to the same extent as during the prevalence of the disease in Europe.

Definition, Characters, Pathology, and Causation.—Leprosy is an incurable constitutional disease, marked externally by discoloured patches and nodules on the skin, and deeply implicating the structure and function of the peripheral nervous system. Like the infections, it has a prodromal stage, which is uncertain in its character, and is measured rather by months or years than by days or weeks; the chief prodromitory symptoms are unaccountable lassitude and mental depression, pains in the limbs and joints, febrile periods (cold and hot fits), loss of appetite, and nausea. That stage is followed by the "periodically eruptive stage," during which blotches on the skin come and go; sooner or later these erythematous congestions and exudations leave either permanent spots, brown or blanched, which are often without feeling, or they leave nodules. The disease diverges into two main

varieties, the spotted (*Lepra maculosa*) and the nodular (*Lepra tuberculosa*). The two kinds are found side by side in the same population, and sometimes in the same person. The maculae arise in the place of former recurrent spots, and are often raised indurations; when the pigmentation deepens, the disease is *L. maculosa nigra*; when the spots become blanched, it is *L. maculosa alba* or white leprosy. Anæsthesia, which very generally goes with the leprosy process, is especially marked in the blanched spots, hence the name *L. anæsthetica*. Anæsthetic spots are apt to have bullæ forming on them (*pemphigus leprosus*), their periodical eruption being attended with fever. The nodules (characteristic of the other form) generally arise also in the situation of old blotches, they are at first small scattered points, but they grow and coalesce to the size of lentils, hazel nuts, or walnuts. While the maculae of leprosy may occur in any part, the nodules are most apt to form on the face (brows, eyelids, ears, wings of the nose, lips, cheeks), causing thickening of all the features (*Leontiasis, Satyrismus*); but they often occur on the hands and feet, and sometimes over the whole body. The nodules, from being exposed to the weather and to injuries, often ulcerate, and the ulcers, like those of syphilis and lupus, tend to spread. Maculae, especially on the limbs, are liable to slighter ulcerations followed by incrustation. Deep ulceration and necrosis occur at the joints of the fingers and toes, which may drop off joint by joint, leaving a well-healed stump (*L. mutilans*). Certain mucous membranes thicken, become nodulated, and ulcerate, viz. the conjunctiva cornea (causing *pannus leprosus*), and the lining of the mouth, nose, throat, and larynx (causing hoarseness). The external groups of lymphatic glands enlarge, leprosy affections of the viscera also are described. The peripheral nerves are the subject of thickenings and degenerations like those in the skin. The new-formed tissue in all situations is granulation-like, as in syphilis and lupus; and leprosy, with those two diseases, is treated of by Virchow under the head of granuloma. By some the nervous lesions (including an alleged affection of the spinal cord) are taken to be primary, while the changes in the skin and other parts (with anæsthesia) are held to be secondary and due to disordered innervation. Leprosy has been claimed as one of the diseases caused by parasites, on several occasions by old writers in the gross sense, and recently by observers who have found innumerable minute bacillus-rods within the cells of the leprosy new growth. The essential cause of leprosy is unknown. It probably arose in the Delta and valley of the Nile in prehistoric times, and under similar climatic and telluric conditions in other (chiefly inter-tropical) countries; and the most memorable fact in its history is its rise and subsidence as an epidemic disease in Europe. It is now endemic (chiefly but not exclusively) among peoples who inhabit the sea-coast or the estuaries of rivers, who live much on fish (often putrid), and who intermarry closely. The old opinion that leprosy is contagious is now generally discredited.

Literature—For history and geographical distribution, see Hirsch, *Handbuch der historisch-geographischen Ethnologie*, 1st ed., Erlangen, 1880 (with exhaustive literature). For pathology, Virchow, *Die krankhaften Geschwülste*, Berlin, 1858-67, vol. ii. For clinical histories, R. Leving, *Elephantiasis Græcorum or True Leprosy*, London, 1878, chap. iv. For mediæval leprosy—in Germany, Virchow, in *Virchow's Archiv*, five articles, vols. xxiii-xxv, 1880-81; in the Netherlands, Jansen, in *Nederl. Tijdschr. voor Geneeskunde*, vol. 1, 1867; in Britain, J. Y. Simpson, *Edin. Med. and Surg. Journ.*, three articles, vols. lxxv and lxxvi, 1848-47. Treatises on modern leprosy in particular localities: Danneberg and Beck (Norway), *Travels in Spitzbergen*, with atlas of twenty-four coloured plates, Paris, 1848; A. F. Anderson, *Leprosy as met with in the Straits Settlements*, coloured photographs with explanatory notes, London, 1872; H. Vandyke Carter (Bombay), *On Leprosy and Elephantiasis*, with coloured plates, London, 1874; Billar, *Leprosy in British Guiana*, an account of West Indian leprosy, with twenty-

two coloured plates, London, 1882. See also the dermatological works of Hebra, Erasmus Wilson, Bazin, and Hutchinson. An important early work is that of P. G. Hensler, *Vom abendländischen Aussatz am Mittelalter*, Hamburg, 1790. (C C)

LEPTIS, now **LEBDA**, the leading city of the ancient Tripolis, Northern Africa, extensive ruins of which exist on the coast, about 50 miles east of Tripoli. Leptis Magna, as it is usually called to distinguish it from Leptis Parva (now Lema) in Byzantium, was a Phœnician colony, probably superimposed on an old Libyan settlement. The old town, of which the massive quays and docks are still extant, is similar to Carthage in position and plan, occupying a tongue of land to the west of the harbour. The new town, whose simple appellation Neapolis almost threatened the disuse of the name Leptis, is much more extensive, but the ruins belong to the later period of the Roman empire. Septimius Severus was a native of the place, and he not only bestowed upon it the *ius Italicum*, but enriched it with many costly buildings, the most remarkable being the palatium dedicated *fortunæ sue* (Procopius). Ammianus mentions that Leptis was laid waste by the Austurians (a Libyan tribe) in 370; and, though Justinian enclosed a part of the city with new walls and made it the military seat of the province of Tripolis, it never recovered its prosperity, and from the time of the Arab conquest it disappears from history. The local inscriptions are Greek, Latin, and Punic. See *Travels of Ali Bey* (by Bédin y Lablich), Barth, *Wanderungen*, &c.; and *Corpus Inscr. Lat.*, viii.

LERIDA, one of the forty-nine provinces of Spain, is bounded on the N. by France (and the "republic" of Andorra), on the E. by Gerona and Barcelona, on the S. by Tarragona, and on the W. by Saragossa and Huesca, and has an area of 4772 square miles, with a population (in 1877) of 285,297. It is almost entirely mountainous, and partakes of the features common to the whole southern slope of the Pyrenees. The principal river is the Segre, a tributary of the Ebro. The province has five cities, Lérida, Balaguer (Bergusia), Cervera, Seo de Urgel, and Solsona, but only the first-mentioned of these has a population exceeding 5000; the next largest (Balaguer) in 1877 had only 4742. The inhabitants are chiefly employed in pastoral occupations.

Lérida, the capital of the above province, and in point of numbers and prosperity the second city in Catalonia, is situated on the right bank of the Segre, crossed there by a handsome stone bridge. The distance by rail from Saragossa and Barcelona respectively are 114 and 113 miles. The old cathedral, on the top of an eminence overlooking the town, was begun in 1203 and consecrated in 1278; it is a Gothic building of merit in some respects, but is rapidly going to decay, having never been used for religious purposes since 1707. The actual cathedral is a Græco-Roman structure dating only from 1749. The town has no other feature of interest. There are manufactures of glass, leather, paper, and of woollen and cotton goods, and a considerable trade in the timber brought down from the Pyrenees by the Segre. Population in 1877, 20,369.

Lérida is the *linda* of the Romans, and was the capital of the people whom they called *Ulerenses* (Pliny) or *Ilergetes* (Ptolemy). By situation the city of Catalonia and Aragon, it was from a very early period an important military station. In the Punic wars it sided with the Carthaginians and suffered much from the Roman arms. In its immediate neighbourhood Hannu was defeated by Scipio in 218 B.C., and it afterwards became famous as the scene of Cæsar's arduous struggle with Pompey's generals Afranius and Petrus in the first year of the civil war (49 B.C.). It was already a municipium in the time of Augustus, and enjoyed great prosperity under later emperors. Under the Goths it became an episcopal see, and at least one ecclesiastical council is recorded to have met there (in 546). Under the Saracens Lérida became one of the principal cities of the province of Saragossa; it became tributary to the Franks in 793, but was reconquered in 797. In 1146 it fell into the hands of Don Ramon Berenguer IV., last count of Barcelona. In modern times it has come through numerous sieges, having been

taken by the French in November 1707 during the war of succession, and again in 1812. In 1820 James II. of Aragon founded a university at Lérida, which achieved some repute in its day, but is now extinct. Pope Calixtus III. at one time taught within its walls, and Vicente Ferrer was one of its alumni.

LERMONTOFF, MIKHAIL YUREVITCH (1814-1841), often styled the poet of the Caucasus, was born in Moscow, but belonged to a respectable family of the Tula government, and was brought up in the village of Tarkhanu (in the Penzensk government), which now preserves his dust. By his grandmother—on whom the whole care of his childhood was devolved by his mother's early death and his father's military service—no cost nor pains was spared to give him the best education she could think of. The intellectual atmosphere which he breathed in his youth differed little from that in which Pushkin had grown up, though the domination of French had begun to give way before the fancy for English, and Lamartine shared his popularity with Byron. From the academic gymnasium in Moscow Lermontoff passed in 1830 to the university, but there his career came to an untimely close through the part he took in some acts of insubordination to an obnoxious teacher. From 1830 to 1834 he attended the school of cadets at St Petersburg, and in due course he became an officer in the guards. To his own and the nation's anger at the loss of Pushkin (1837) the young soldier gave vent in a passionate poem addressed to the czar, and the very voice which proclaimed that, if Russia took no vengeance on the assassin of her poet, no second poet would be given her was itself an intimation that a poet had come already. The czar, however, seems to have found more impertinence than inspiration in the address, for Lermontoff was forthwith sent off to the Caucasus as an officer of dragoons. He had been in the Caucasus with his grandmother as a boy of ten, and he found himself at home by yet deeper sympathies than those of childish recollection. The stern and rocky virtues of the mountaineers against whom he had to fight, no less than the scenery of the rocks and mountains themselves, proved akin to his heart; the emperor had exiled him to his native land. He was in St Petersburg in 1838 and 1839, and in the latter year wrote the novel *A Hero of Our Time*, which is said to have been the occasion of the duel in which he lost his life in July 1841. In this contest he had purposely selected the edge of a precipice, so that if either combatant was wounded so as to fall his fate should be sealed.

Lermontoff published only one small collection of poems in 1840. Three volumes, much mutilated by the censorship, were issued in 1845 by Glazouff; and there have been full editions of his works in 1890 and 1893. To Bodenstedt's German translation of his poems (*Mikhail Lermontoff's poetischer Nachlass*, Berlin, 1842, 2 vols.), which indeed was the first satisfactory collection, he is indebted for a wide reputation outside of Russia. His novel has found several translators (August Bolte, Berlin, 1859, &c.). Among his best-known pieces are "Ismail-Bey," "Hadji Abrek," "Walerik," "The Novice," and, remarkable as an imitation of the old Russian ballad, "The song of the Czar Ivan Vasilvitch, his young bodyguard, and the bold merchant Kalashnikov."

See Tullander, "Le Poète du Caucase," in *Revue des Deux Mondes* (February 1890), republished in *Albums et Contes*, Paris, 1896, and Proust's "Materiales for the Biography of Lermontoff," prefixed to the 1893 edition of his works.

LEROUX, PIERRE (1798-1871), a French writer on philosophy and politics, commonly recognized as the chief of the (so-called) Humanitarian school, was born at Paris in 1798. He was the son of an artisan. He received his early education at the Lycée Charlemagne, and continued his studies at Rennes. Having obtained an admission to the Polytechnic school, he renounced it in order to support by the labour of his hands his mother and family, who had been left destitute by the death of his father. He first worked as a mason, but soon became a compositor in the printing establishment of his cousin, and afterwards over-seer in that of M. Panckoucke. In 1824 P. Dubois, a

former schoolfellow, associated him with himself in the foundation of the *Globe* newspaper, in which he became a co-worker with De Broglie, Guizot, Duvergier de Hauranne, Jouffroy, and other distinguished persons. For some time he occupied the position of an advanced Liberal of the ordinary type, but in January 1831 he gave his adhesion to the Saint-Simonian community, of which he became a prominent member; and under his influence the *Globe* became the organ of its doctrines. In November of the same year, when Entanin preached the enfranchisement of women and the functions of the *couple-prêtre*, Leroux took the part of Bazard, and, protesting in the name of morality, separated himself from the sect. In 1835, in conjunction with J. Reynaud, who had seceded with him, he founded the *Encyclopédie Nouvelle*, in which he expounded his philosophical and social views. Amongst the articles which he inserted in it were one entitled *De l'Égalité*, and a *Réfutation de l'Électisme*, which afterwards appeared as separate works. In 1840 he published his treatise *De l'Humanité*, which contains the fullest exposition of his system, and was regarded as the philosophical manifesto of the Humanitarians. In 1841, disgusted with the *Revue des Deux Mondes* on account of its desertion of the democratic cause, he established, with the aid of M. Viardot and Mme. George Sand, the *Revue Indépendante*. By his philosophic association with the latter eminent writer he obtained the advantage of an eloquent interpreter, capable of charming and impressing the masses. Mme. Sand's *Spiridion*, which was dedicated to him, her *Sept Cordes de la Lyre*, her *Consuelo*, and its continuation *La Comtesse de Rudolstadt*, were written under the Humanitarian inspiration. From the year 1843 M. Leroux devoted himself to the practical applications of his doctrines. He established at Boussac (Creuse) a printing association organized according to his systematic ideas, and founded the *Revue Sociale*, in which, as well as in separate publications, he continued to explain and develop his theoretic views and his suggestions for the renovation of society, professing, amongst other things, to supply "a pacific solution of the problem of the proletariat." After the outbreak of the revolution of 1848 he was elected to the constituent assembly as representative of the department of the Seine, obtaining 90,000 votes, and afterwards, in 1849, to the legislative assembly. He spoke there on the organization of labour, on the colonization of Algeria, and other questions. His discourses from the tribune were sometimes of so abstract and mystical a character, and contained proposals so eccentric and impracticable that they rather created ridicule than influenced opinion. The *coup d'état* of 1851 made him an exile; he settled with his family in Jersey, where he pursued agricultural experiments. The general amnesty of 1860 permitted his return to France, but he lived at Lausanne till after the definitive amnesty of 1869, when he again fixed his residence at Paris. He died there in April 1871, during the reign of the Commune. That body deputed two of its members to attend his funeral, as a homage, "not to the partisan of the mystical idea, of which we now feel the evil, but to the politician who, after the days of June, courageously undertook the defence of the vanquished."

The writings of Leroux, though they won a transitory clasp and gave him a position as head of a school, appear to have no permanent significance in the history of thought. His social theories do not rest on any scientific basis; he was rather the propagandist of sentiments and aspirations than the expounder of well-defined and distinctly appreciable ideas. He seems to have had a natural bent towards the mystic and the nebulous. He has, indeed, a system, but it is a singular medley of doctrines borrowed, not only from Saint-Simonianism, but from Pythagorean and Buddhist sources. In philosophy his fundamental principle is that of what he calls the "trid,"—a triad of which he endeavours to pervade all things, which in God is "power, intelligence, and love" in man "sensation,

sentiment, and knowledge." His religious doctrine is Pantheistic; and, rejecting the belief in a future life as commonly conceived, he substitutes for it a theory of metempsychosis. In social economy his views are very vague, he preserves the family, country, and property, but finds in all three, as they now are, a despotism which must be eliminated. He imagines certain combinations by which this triple tyranny can be abolished, so that the human being may be developed under the influence of those several institutions without being oppressed by them. But his solution seems to require the creation of families without heads, countries without governments, and property without rights of possession. In politics he advocates absolute equality—a democracy pushed to anarchy. A full exposition of his system will be found in L. Reybaud's *Études sur les Réformateurs et Socialistes Modernes*.

The full title of Leroux's principal work is *Le l'Humanité, de son principe et de son avenir, où se trouve exposée la vraie définition de la religion, et où l'on explique le sens, la suite, et l'achèvement du Mouvement du Christianisme*. A second edition of this work appeared in 1845. Amongst his other publications, in addition to some already mentioned, are—*Discours sur la situation actuelle de la Société et de l'esprit humain*, 1841, new ed., 2 vols., 1847, *D'une Religion nationale, ou du Cible, 1846*, *Discours sur la fusion des lettres de travail*, 1848, *Prêt d'une Constitution démocratique et sociale*, 1848, *De Christianisme et de ses origines démocratiques*, 1848, *La Carrière de M. Aguado, ou se trouvent les richesses qui paient les pauvres*, 1848, *De la Ploutocratie; ou du gouvernement des riches*, 1848, *Malheur et les Économistes, ou l'aveu-t-il toujours des pauvres?* 1849, *Quelques pages de l'Érèbe*, 1859, perhaps of a philosophical poem, entitled *La Grèce de Socrate*, 1863-64, *Joh, thème en cinq actes, par le prophète Israhel, traduit de l'Ébreu*, 1866. M. Leroux also produced, with the aid of an anonymous collaborator, a translation of Goethe's *Werther*, which was published in 1849, with a preface by George Sand.

LERWICK. See SHETLAND ISLANDS.

LE SAGE, ALAIN REY (1668-1747), novelist and dramatist, was born at Sarzeau in the peninsula of Rhuy, between the Morbihan and the sea, on the 8th of May 1668, and died on the 17th of November 1747, at Boulogne-sur-Mer. Rhuy was a legal district, and Claude Le Sage, the father of the novelist, held the united positions of advocate, notary, and registrar of its royal court. His wife's name was Jeanne Brenugat. Both father and mother died when Le Sage was very young, and his property was wasted or embezzled by his guardians. Little is known of his youth except that he went to school with the Jesuits at Vannes until he was eighteen. Conjecture has it that he continued his studies at Paris, and it is certain that he was called to the bar at the capital in 1692. In August 1694 he married the daughter of a joiner, Marie Elizabeth Huyard. She was beautiful but had no fortune, and Le Sage had little practice. About this time he met his old schoolfellow the dramatist Danchet, and is said to have been advised by him to betake himself to literature. He began modestly as a translator, and published in 1695 a French version of the *Epistles* of Aristænetus, which was not successful. Shortly afterwards he found a valuable patron and adviser in the Abbé de Lyonne, who bestowed on him an annuity of 600 livres, and recommended him to exchange the classics for Spanish literature, of which he was himself a student and collector. Le Sage began by translating plays chiefly from Rojas and Lope de Vega. *Le Traite Puné* and *Le Point d'Honneur* from the former, *Don Félix de Mendocce* from the latter, were acted or published in the first two or three years of the 18th century. In 1704 he translated the continuation of Don Quixote by Avellaneda, and soon afterwards adapted a play from Calderon, *Don César Ursin*, which had a divided fate, being successful at court and damned in the city. He was, however, nearly forty before he obtained anything like decided success. But in 1707 his admirable farce of *Crispin Rival de son Maître* was acted with great applause, and *Le Diable Boiteux* was published. This latter went through several editions in the same year, and was frequently reprinted till 1725, when Le Sage altered and improved it considerably, giving it its present form. Notwithstanding the success of *Crispin*, the actors did not

like Le Sage, and refused a small piece of his called *Les Étrennes*. He thereupon altered it into *Turcaret*, his theatrical masterpiece, and one of the best comedies in French literature. This appeared in 1709. Some years passed before he again attempted romance writing, and then the first two parts of *Gil Blas* appeared in 1715. Strange to say, it was not so popular as the *Diabre Boiteux*. Le Sage worked at it for a long time, and did not bring out the third part till 1734, nor the fourth till 1735. For this last he had been paid to the extent of a hundred pistoles some years before its appearance. This is the only positive statement we have about his gains. During these twenty years he was, however, continually busy. Notwithstanding the great merit and success of *Turcaret* and *Crispin*, the Théâtre Français did not welcome him, and in the year of the publication of *Gil Blas* he began to write for the Théâtre de la Foire—the comic opera held in booths at festival time. This, though not a very dignified occupation, was followed by many writers of distinction at this time, and by none more assiduously than by Le Sage. According to one computation he produced either alone or with others about a hundred pieces, varying from strings of songs with no regular dialogue, to comedettes only distinguished from regular plays by the introduction of music. He was also industrious in prose fiction. Besides finishing *Gil Blas* he translated the *Orlando Innamorato*, rearranged *Guzman d'Alfarache*, published two more or less original novels, *Le Bachelier de Salamancue* and *Estevanilla Gonzalez*, and in 1733 produced the *Vie et Aventures de M. de Beauchêne*, which is curiously like certain works of Defoe. Besides all this, Le Sage was also the author of *La Valise Trouvée*, a collection of imaginary letters, and of some minor pieces, of which *Une Journée des Parques* is the most remarkable. This laborious life he continued until 1740, when he was more than seventy years of age. His eldest son had become an actor, and Le Sage had disowned him, but the second was a canon at Boulogne in comfortable circumstances. In the year just mentioned his father and mother went to live with him. At Boulogne Le Sage spent the last seven years of his life, dying, as has been said, on the 17th of November 1747, at the age of nearly eighty.

Not much is known of Le Sage's life and personality, and the foregoing paragraph contains not only the most important but almost the only facts available for it. The few anecdotes which we have of him represent him as a man of very independent temper, declining to accept the condescending patronage which in the earlier part of the century was still the portion of men of letters. Thus it is said that, on being remonstrated with, as he thought impolitely, for an unavoidable delay in appearing at the duchess of Bouillon's house to read *Turcaret*, he at once put the play in his pocket and retired, refusing absolutely to return. In his old age, when he was very deaf, he is also said to have been decidedly arbitrary in his choice of the persons whom he permitted to have access to his trumpet, but this is not unusual in such cases. It may, however, be said that as in time so in position he occupies a place apart from most of the great writers of the 17th and 18th centuries respectively. He was not the object of royal patronage like the first, nor the pet of *salons* and coteries like the second. Indeed he seems all his life to have been purely domestic in his habits, and purely literary in his interests.

The importance of Le Sage in French and in European literature is not entirely the same, and he has the rare distinction of being more important in the latter than in the former. His literary work may be divided into three parts. The first contains his *Théâtre de la Foire* and his few miscellaneous writings, the second his two remarkable

plays *Crispin* and *Turcaret*, the third his prose fictions. In the first two he swims within the general literary current in France; he can be and must be compared with others of his own nation. But in the third he emerges altogether from merely national companionship. It is not with Frenchmen that he is to be measured. He formed no school in France, he followed no French models. His work, admirable as it is from the mere point of view of style and form, is a parenthesis in the general development of the French novel. That product works its way from *Madame de la Fayette* through *Marivaux* and *Prévost*, not through *Le Sage*. His literary ancestors are Spaniards, his literary contemporaries and successors are Englishmen. The position is almost unique, it is certainly interesting and remarkable in the highest degree.

Of *Le Sage's* miscellaneous work, including his numerous farce-opérettes, there is not much to be said except that they are the very best kind of literary hack work. The pure and original style of the author, his abundant wit, his cool humorous attitude towards human life, which wanted only greater earnestness and a wider conception of that life to turn it into true humour, are discernible throughout. But this portion of his work is practically forgotten, and no sensible critic who has taken the trouble to examine it will say that for the world at large there is any reason why it should be resuscitated. Of such work every generation produces its own quota, which is sufficient for the day. *Crispin* and *Turcaret* show a stronger and more deeply marked genius, which but for the ill-will of the actors might have gone far in this direction. But *Le Sage's* peculiar unwillingness to attempt anything absolutely new discovered itself here. Even when he had devoted himself to the Foire theatre, it seems that he was unwilling to attempt when occasion called for it the absolute innovation of a piece with only one actor, a crux which *Piron*, a lesser but a bolder genius, accepted and carried through. *Crispin* and *Turcaret* are unquestionably Moliéresque, though they are perhaps more original in their following of Molière than any other plays that can be named. For this also was part of *Le Sage's* idiosyncrasy that, while he was apparently unable or unwilling to strike out an entirely novel line for himself, he had no sooner entered upon the beaten path than he left it to follow his own devices. *Crispin Révolté* or *Maitre* is a farce in one act and many scenes, after the earlier manner of motion. Its plot is somewhat extravagant, inasmuch as it lies in the effort of a knavish valet, not as usual to further his master's interests, but to supplant that master. But the charm of the piece consists first in the lively bustling action of the short scenes which take each other up so promptly and smartly that the spectator has not time to cavil at the improbability of the action, and secondly in the abundant wit of the dialogue. *Turcaret* is a far more important piece of work. The only thing which prevents it from holding the very highest place is a certain want of unity in the plot. This unity, however, which was too often attained by Molière through the exaggeration of the ruling-passion theory, as in *Tartuffe* and the *Misanthrope*, is compensated in *Turcaret* by the most masterly profusion of character-drawing in the separate parts. *Turcaret*, the ruthless, dishonest, and dissolute financier, his vulgar wife as dissolute as himself, the hare-brained marquis, the knavish cavalier, the baroness (a coquette with the finer edge taken off her fine-ladyhood, yet by no means unlovable), are each and all finished portraits of the best comic type, while almost as much may be said of the minor characters. The style and dialogue are also worthy of the highest praise; the wit never degenerates into mere "wit-combat."

It is, however, as a novelist that the world has agreed to remember *Le Sage*, and the world as usual is right. A

great deal of unnecessary labour has been spent on the discussion of his claims to originality. What has been already said will give a sufficient clue through this thorny ground. In mere form *Le Sage* is not original. He does little more than adopt that of the Spanish picaresque romance of the 16th and 17th century. Often, too, he prefers merely to rearrange and adapt existing work, and still oftener to give himself a kind of start by adopting the work of a preceding writer as a basis. But it may be laid down as a positive truth that he never in any work that pretends to originality at all is guilty of anything that can fairly be called plagiarism. Indeed we may go further, and say that he is very fond of asserting or suggesting his indebtedness when he is really dealing with his own funds. Thus the *Diablo Botteux* borrows the title, and for a chapter too the plan and almost the words, of the *Diablo Cojuelo* of Luis Vélez de Guevara. But after a few pages *Le Sage* leaves his predecessor alone. Even the plan of the Spanish original is entirely discarded, and the incidents, the episodes, the style, are as independent as if such a book as the *Diablo Cojuelo* had never existed. The case of *Gil Blas* is still more remarkable. It was at first alleged that *Le Sage* had borrowed it from the *Alarcos de Obregon* of Vincent Espinel, a curiously rash assertion, inasmuch as that work exists and is easily accessible, and as the slightest consultation of it proves that, though it furnished *Le Sage* with separate incidents and hints for more than one of his books, *Gil Blas* as a whole is not in the least indebted to it. Afterwards Father Isla asserted that *Gil Blas* was a mere translation from an actual Spanish book—an assertion at once incapable of proof and disproof, inasmuch as there is no trace whatever of any such book. A third hypothesis is that there was some manuscript original which *Le Sage* may have worked up in his usual way, in the same way, for instance, as he professes himself to have worked up the *Bachelier de Salamanca*. This also is in the nature of it incapable of refutation, though the argument from the *Bachelier* is strong against it, for there could be no reason why *Le Sage* should be more reticent of his obligations in the one case than in the other. Except, however, for historical reasons, the controversy is one which may be safely neglected. There is as little doubt (with the limitations already laid down) of the originality of *Le Sage* as of that of any great writer in the world. *Gil Blas* then remains its property, and it is admittedly the capital example of its own style. Fielding has been called the prose Homer of human nature, but in the sense in which the expression was used it is doubtful whether his master (as *Le Sage* certainly was) is not better entitled to the term. For *Le Sage* has not only the characteristic which Homer and Shakespeare have of absolute truth to human nature as distinguished from truth to this or that national character, but he has what has been called the quality of detachment, which they also have. He never takes sides with his characters as Fielding does. Asmodeus and Don Cleofas, *Gil Blas* and the Archbishop and Doctor Sangrado, are produced by him with exactly the same impartiality of attitude. Except that he brought into novel writing its highest quality of artistic truth, it perhaps cannot be said that he did much to advance prose fiction in itself. He invented, as had been said, no new *genre*; he did not, as *Marivaux* and *Prévost* did, help on the novel as distinguished from the romance. In form his books are undistinguishable, not merely from the Spanish romances which are, as have been said, their direct originals, but from the medieval *romans d'aventures* and the Greek prose romances. But in individual excellences they have few rivals. Nor should it be forgotten, as it sometimes is, that *Le Sage* was a great master of French style, the greatest unquestionably between the classics of the 17th century and the

classics of the 18th. He is perhaps the last great writer before the decadence (for since the time of Paul Louis Courier it has not been denied that the *philosophic* period is in point of style a period of decadence). His style is perfectly easy at the same time that it is often admirably epigrammatic. It has plenty of colour, plenty of flexibility, and may be said to be exceptionally well fitted for general literary work.

The dates of the original editions of Le Sage's most important works have already been given. He published during his life a collection of his regular dramatic works, and also one of his pieces for the Foire, but the latter is far from exhaustive, nor is there any edition which can be called so, though the *Œuvres Choisies* of 1782 and 1818 are useful. The *Double Botteux* and *Œil Bleu* have been reprinted and translated numberless times. Both will be found conveniently printed, together with *Edouard Goussier* and *Goussier d'Alfort*, the best of the minor novels, in four volumes of Garnier's *Bibliothèque Américaine* (Paris, 1866). *Parovert* and *Crispin* are to be found in all collected editions of the French drama. There is a useful edition of them, with ample specimens of Le Sage's work for the Foire, in two volumes (Paris, 1821) (G. B.).

LESBOS was the name applied by the Greeks to the island now called Meolia—the ancient name of the chief city on the island, Mytilene, having been in the Middle Ages applied to the whole island. It lies along the coast of Mysia, north of the entrance to the Gulf of Smyrna. Strabo estimates its circumference as 1100 stadia, about 138 miles, and Scylax reckons it seventh in size of the islands in the Mediterranean Sea. The narrowest part of the channel which divides it from the Mysian coast, between the promontory of Argencum and the town of Assos, is about 8 miles wide. The island is of irregular shape; it has three prominent points, Argencum on the north-east, Sigrium (now Sigrî) on the west, and Mælea (now Maria) on the south-east, and a deep gulf, the Euripus Pyrrhæus, now the port of Calloni, runs far into its western side between Sigrium and Mælea. The surface is mountainous, but the soil is in spite of this exceedingly fertile; the wine, oil, and grain of Lesbos were well known in ancient times. The climate is perhaps more delightful than that of any other part of the *Ægean*, the breezes and the sea temper the heat of summer, and the winter is not severe. Earthquakes were often experienced in the island, the latest, that of 1861, is still remembered as one of the severest known in a country of earthquakes.

The oldest inhabitants are said to have been Pelasgians; and two generations before the Trojan war came Ionians under Mæcæus. These two races may be said to represent respectively the first period of primitive barbarism, and the second period, when navigation brought to the island the commerce and intercourse of more advanced races; it deserves notice that the name Mæcæus, the Phœnician Melkart, is taken by Curtius as a sign of the presence of Phœnician traders. But the island begins to be important in history from the time of the *Æolian* immigration, which is said to have commenced one hundred and thirty years after the Trojan war; from this time it continued long to be one of the chief homes of Hellenic civilization. Homer refers to its wealth and its populous cities, its chief fame lies in its connexion with the earliest development of Greek poetry and literature. Lesches the cyclic poet, Terpander, Arion, Hellanicus, Pittacus, Alceus, and Sappho were all natives of Lesbos. Probably no district of Greece can boast of so many names, most of them associated with some marked advance in literature, as Lesbos can enumerate between 700 and 800 A.C.

The chief city of Lesbos was Mytilene or Mitylene, the latter spelling being general in literature while the former is the official spelling used on coins. It was originally built on an island close to the western coast of Lesbos; afterwards when the limits of the island were too narrow it was joined to Lesbos by a causeway, and the city spread

out along the coast. On each side of this isthmus was a harbour; not far from the city was a place called Malœio, but it does not appear that this name was, as some have said, given to the northern harbour. The city has always been known for its delightful and healthy climate. With the advantage of its strong situation and good harbour it soon became one of the most powerful Greek cities of Asia Minor. It was the only *Æolian* city that possessed a strong navy. Its colonies were spread along Asia Minor and Thrace, and in the 6th century it maintained a long though finally unsuccessful contest with Athens for the possession of Sigeum. About its internal government little is known. After the kingly period there was a time when oligarchical and democratical factions contended with one another. The noble family of the Pentelidæ, descended from Penthius, son of Orestes, played a great part in these contentions. Its Pelopid descent may be compared with various legends that connect Pelops with the island of Lesbos. The city fell under the Persian power after the defeat of Cressus. A tyrant Coes ruled it soon after, but was expelled when the island joined the Ionic revolt in 500 B.C. It was freed from the Persian yoke after the battles of Platea and Myræa, and was a member of the Delian confederacy. It revolted from Athens 429 B.C., and was reduced after a long siege. The story of the cruel revenge which the Athenian assembly at first resolved on, and of the second meeting and the more merciful resolution, and of the arrival of the second despatch vessel barely in time to prevent the massacre of the whole male population, has been told by Thucydides. The territory of Mytilene was, however, divided among Athenian *κλῆροῦχοι*.

The harbour was the scene of a great battle between Callicratidas and Conon in the latter part of the Peloponnesian war; but it is impossible here to trace all the vicissitudes of its history, which are coincident with the history of Greece in the East. It continued to be a rich and prosperous city throughout ancient history, and its name came during the Byzantine period to be applied to the whole island. It was long a stronghold of the Venetians during the Middle Ages, but has belonged to the Turkish empire since 1430.

The other chief towns besides Mytilene were Methymna, Antissa, Eresus, and Pyrrha; hence the island is sometimes called a Pentapolis. There was also a town called Arisbe, which was destroyed by an earthquake before the time of Herodotus; Conza finds its site inland at Palaïokastro, north-east of the port of Calloni. Pyrrha lay on the south-east coast of this port, at a place also called Palaïokastro. Antissa, near Sigrium, was destroyed by the Romans in 163 B.C., as having sided with Parseus in the Macedonian war. Eresus, now Eresî, was also near Sigrium. Of these five cities, Mitylene was the chief; Pyrrha, Eresus, and Antissa were under its influence, and seem almost always to have followed its lead. But Methymna on the north coast, though it had not such a fine situation as Mitylene, was a very strong place, it was therefore able to maintain a constant quarrel with the more powerful city, and was always ready to side with its enemies. Molyvo, still the second city of the island, occupies the site of the old Methymna. The name Methymna or Mathymna is derived from the wine for which it was famous (Virg., *Georg.*, ii. 90).

See Conza, *Reise auf der Insel Lesbos*; Plehn, *Lesbos*; Böttner, *Archæol. d. Miletens. Seeländ. et. d. Lesbos*, v. (according to Conza not very trustworthy); Zanders, *Beitr. z. Kunde d. Insel Lesbos*; Newton, *Travels*; and for the geography Grauert, *Descr. of Asia Minor*, and Forbiger, *Alt. Georg.* The best maps are the English admiral's charts, and those in Conza's work.

LESCHIANS, or LESCHIS (from the Persian *Lekhi*, called Lekî by the Græcians or Georgians, Armenians, and Ossetians), a number of tribes in the Caucasus forming

along with the Tchetchenians (about 165,000) the East Caucasian group, and spreading southward over the borders of Daghestan, the country which they have occupied from time immemorial, into the Transcaucasian circles Kuba, Shemakha, Nukha, and Sakatsky. They are mentioned as Ἀλῆαι by Strabo and Plutarch along with the Ἰβλῆαι (perhaps the modern Gaigai, a Tchetchenian tribe), and their name occurs with great frequency in the old chronicles of the Georgians, whose territory was exposed to their raids for centuries, until through the fall of Shamyl they were brought under subjection to Russia. Moses of Chorene mentions a battle in the reign of the Armenian King Baba (370–377 A.D.), in which Shagir, king of the Lekians, was slain. Among the Lezgians the chief place, both on account of numbers and importance, is due to the Avars (155,194) and the closely related Andians (35,511), to whom may be attached the Dido (9074) and a number of small tribes, confined to a few villages or even to one, and speaking different though intimately connected languages. The Avars, extending from the Sulak and the Kumyk steppes right through Daghestan to the Alasan in the Sakatsky circle, were once the dominant people as their language is still the dominant language of all this district. Their neighbours the Kasumukhians (35,139), who call themselves Lakians, have a language of their own, and are well known as traders not only through all Transcaucasia but also in European Russia; beside them a small fragment of another race occupies the village Aitchi (592 inhabitants) in a separate mountain valley. Towards the Caspian Sea the Lukians are bordered by the Darghians (88,045) and the Tabassaranians (16,350), who in the matter of dialect are strongly marked off from each other. To the north and south of the basin of the Samur (which consequently bears the native name Kul-an-az or "middle river") lives another of the leading tribes of Daghestan, the Kurinians or Lezgians *par excellence*, who by themselves alone occupy the circles of Kuri and Samur, as well as the greatest part of Kuba, and parts of Shemakha, Nukha, &c. Their language (investigated like other Caucasian tongues by Baron Ussler) is there spoken by 130,873 individuals; and closely related to it apparently are the languages of the neighbouring Agulians (5357), Rutulians (11,803), Zakhurians (4561). According to the specimens collected by Von Seidlitz in 1830 during a visit to their country, which lies round the snowy peak of the Shakh Dagh in the Kuba circle, the Djekians, Haputians, and Krysiens speak what seem to be dialects of Kurinian; but he cannot connect with any other tongue the language spoken by the peculiar-looking inhabitants of the neighbouring village of Khinalugh (2196). The Udiniens (9668) are another Lezgian tribe, which, though at present it only occupies a few villages in the Nukha circle, was formerly widely distributed over the plain of the Kura, and may possibly be the wretched remnant of the Albanians, mentioned by Strabo and others as a people of similar importance with the Grusnians and Armenians.

All these Lezgians are more or less tall, good-looking and powerful, sometimes fair sometimes dark, bold, enduring, and intelligent—in one word, excellent material for the work of civilization as soon as their country is opened up by roads and the railway just projected from Vladikavkas by Petrovsk to Baku. Smith-work and cutlery are skilfully wrought among the Lezgians in general; the women weave excellent shawls (which vary in style according to locality); and the felt cloaks of Andi are known throughout the Caucasus.

See Von Seidlitz, "Etnographie des Kaukasus," in Petermann's *Mittheilungen*, 1830.

LESLEY, JOHN (1527–1596), bishop of Ross, Scottish historian and statesman, was born in 1527. His father

was Gavin Lesley, parson of Kingsnise. He was educated at the university of Aberdeen, where he took the degree of M.A. In 1538 he obtained a dispensation permitting him to hold a benefice, notwithstanding his being a natural son, and in June 1546 he was made an acolyte in the cathedral church of Aberdeen, of which he was afterwards appointed a canon and prebendary. He also studied at Poitiers, at Toulouse, and at Paris, where he was made doctor of laws. In 1558 he was appointed official of Aberdeen, and in 1559 he was inducted into the parsonage and prebend of Oyne. At the Reformation Lesley became a champion of the Romish faith, and appeared on that side at the disputation held in Edinburgh in 1561, when Knox was one of his antagonists. He was one of the commissioners sent the same year to bring over the young Queen Mary to take the government of Scotland. He returned in her train, and was appointed a privy councillor, and in 1564 one of the senators of the college of justice. Shortly afterwards he was made abbot of Lindores, and in 1565 bishop of Ross. He was one of the sixteen commissioners appointed to revise the laws of Scotland, and the volume of the Acts of Parliament known as the Black Acts was, chiefly owing to his care, printed in 1566.

The bishop was one of the most steadfast friends of Queen Mary.¹ After the failure of the royal cause, and whilst Mary was a captive in England, Lesley continued to exert himself on her behalf. He was one of the commissioners at the conference at York in 1568. He appeared as her ambassador at the court of Elizabeth to complain of the injustice done to her, and when he found he was not listened to he laid plans for the escape of the queen. He also projected a marriage for her with the duke of Norfolk, which ended in the execution of that nobleman. For this he was put under the charge of the bishop of Ely, and afterwards imprisoned in the Tower of London. During his confinement he collected materials for his history of Scotland, with which his name is now chiefly known. In 1571 he presented the latter portion of this work, written in his own vernacular tongue, to Queen Mary to amuse her in her captivity. He also wrote for her use his *Pis Consolations*, and the queen devoted some of the hours of her captivity to translating a portion of it into French verse.

In 1573 he was liberated from prison, but was banished from England. For two years he attempted unsuccessfully to obtain the assistance of Continental princes in favour of Queen Mary. While at Rome in 1578 he published his history *De Origine, Moribus, et Rebus Gestis Scottorum*, the Latinity of which is held only second to that of Buchanan. In 1579 he went to France, and was made suffragan and vicar-general of the archbishopric of Rouen by the Cardinal de Bourbon. Whilst visiting his diocese, however, he was thrown into prison, and had to pay 3000 pistoles to prevent his being given up to Elizabeth. During the remainder of the reign of Henry III. he lived unmolested, but on the accession of the Protestant Henry IV. he again fell into trouble. In 1590 he was thrown into prison, and had to purchase his freedom at the same expense as before. In 1593 he was made bishop of Coutances in Normandy, and had licence to hold the bishopric of Ross till he should obtain peaceable possession of the former see. Being tired of life, he retired at last to a monastery at Gurtzburg near Brussels, where he died in 1596.

The works of Lesley are as follows:—*A defence of the Honour of Marie Queen of Scotland*, by *Euastius Dauphiale*, 8vo, London, 1609; *A treatise concerning the defence of the Honour of Marie Queen of Scotland*, made by *Morgan Philipps*, bachelor of divinity,

¹ An interesting account of his care of her during her illness at Jostburgh is given in *Proc. Roy. Soc. Ant. Scot.*, vol. xv. p. 210.

8vo, Lugo, 1570-71, *Pro effluviis annis consolatones, ad Marianum Scot. Reg.*, 8vo, Paris, 1574, *Pio libello impubanda Orazio, ad Elizabetham*, 8vo, Paris, 1574, *De origine, moribus, et rebus gestis Rectorum, libri decem*, 4to, Rome, 1573 and 1575, *De illustrium personarum in republica administranda auctoritate libellus*, 4to, Rheims, 1580, *De titulo de jure Marianus Scot. Reg. quo regna Anglie successione sua jure vindicant*, 4to, Rheims, 1580; *A treatise touching the right of Maria Queen of Scotland, and of King James her graces issue to the succession of the crown of England*, 8vo, 1581, *Congratulatio Alberto Archiduci Austrie de eius adventu ad sequens provinciarum inferiorum Germaniam*, 8vo, Brussels, 1580; *The History of Scotland from 1480 to 1561*, edited for the Bannatyne Club by Thomas Thomson from a MS. in the possession of the earl of Leven and Melville, 4to, Edinburgh, 1830. Several of Lesley's works, of which the originals are very rare, will be found reprinted in Anderson's *Collections relating to the History of Queen Mary*, and in Jebb, *De vite Marianæ Reg. Scot. vita*.

LESLIE, ALEXANDER. See LIVEN, EARL OF.

LESLIE, or LESLEY, CHARLES (1650-1722), a prominent nonjuror, famous as the author of *A Short and Easy Method with the Deists*, was born in 1650 in Ireland, where his father, Dr John Leslie, was bishop of Raphoe and subsequently of Clogher. His early education was received at Inniskilling, Fermanagh, and in 1664 he was admitted a fellow commoner in Trinity College, Dublin, where he continued until he commenced master of arts. On his father's death in 1671, removing to England, he entered himself as a student of law at the Temple, but soon afterwards turned his attention to theology, and took orders in 1680. Seven years later he became chancellor of the cathedral of Connor and a justice of the peace, and began a long career of public controversy by responding in public disputation at Monaghan to the challenge of the Roman Catholic bishop of Clogher. Although an eager and uncompromising opponent of Roman Catholicism, Leslie was a firm supporter of the Stuart dynasty, and, having declined at the Revolution to take the oath to William and Mary, he was on this account deprived of his benefice. In 1689 the growing troubles in Ireland induced him to withdraw to England, where he employed himself for the next twenty years in writing various controversial pamphlets in favour of the nonjuring cause, and in numerous polemics against the Quakers, Jews, Socinians, and Papists, and especially in that against the Deists with which his name is now most commonly associated. A warrant having been issued against him in 1710 for his pamphlet *The Good Old Cause, or Lying in Truth*, he in that year resolved to quit England and to accept an offer made by the Pretender (with whom he had previously been in frequent correspondence) that he should reside with him at Bar-le-Duc. After the failure of the Stuart cause in 1715, Leslie accompanied his patron into Italy, where he remained until 1721, in which year, having found his sojourn amongst Roman Catholics extremely unpleasant, he sought and obtained permission to return to his native country. He died at Ghalongh, Monaghan, on April 13, 1722.

The *Theological Works* of Leslie were collected and published by himself in 2 vols. folio, 1721; a later edition, slightly enlarged, appeared at Oxford in 1832 (7 vols. 8vo). They handle the controverted points of which they treat with considerable force of argument and rigour of style; he had the somewhat rare distinction of making several converts by his reasonings, and probably persons might still be found who are prepared to concur in Dr Johnson's dictum that "Leslie was a reasoner, and a reasoner who was not content to be reasoned against." But the questions in dispute are no longer discussed on the basis which seems to have been pretty unanimously accepted by the orthodox theologians of that age. This is sufficiently seen when the promise given in the title of his best-known work is contrasted with the actual performance. The book professes to be *A Short and Easy Method with the Deists, wherein the reasonableness of the Christian Religion is demonstrated by Infallible Proof from Four Titles, which are incompatible to any suppositors which can yet have been, or that can possibly be* (1697). The four rules which, according to Leslie, have only to be rigorously applied in order to establish not the probability merely but the absolute certainty of the truth of Christianity are simply these:—(1) that the

matter of fact be such as that men's outward senses, their eyes and ears, may be judges of it, (2) that it be done publicly, in the face of the world, (3) that not only public monuments be kept up in memory of it, but some outward actions be performed, (4) that such monuments and such actions or observances be instituted and do commence from the time that the matter of fact was done. Other publications of Leslie are *The Snake in the Grass* (1696), against the Quakers, *A Short Method with the Jews* (1689), *The Socinian Controversy Discussed* (1697); *The True Notion of the Catholic Church* (1703); and *The Case Stated between the Church of Rome and the Church of England* (1713).

LESLIE, CHARLES ROBERT (1794-1859), one of the most popular of English genre-painters, was born in London on the 19th of October 1794. His parents were American, and when he was five years of age he returned with them to their native country. They settled in Philadelphia, where their son was educated and afterwards apprenticed to a bookseller. He was, however, mainly interested in painting and the drama, and when George Frederick Cooke visited the city he executed a portrait of the actor, from recollection of him on the stage, which was considered a work of such promise that a fund was raised to enable the young artist to study in Europe. He left for London in 1811, bearing introductions which procured for him the friendship of West, Beechey, Allston, Coleridge, and Washington Irving, and was admitted as a student of the Royal Academy, where he carried off two silver medals. At first, influenced by West and Fuseli, he essayed "high art," and his earliest important subject depicted Saul and the Witch of Endor; but he soon discovered his true aptitude and became a painter of cabinet-pictures, dealing, not like those of Wilkie, with the contemporary life that surrounded him, but with scenes from the great masters of fiction, from Shakespeare and Cervantes, Addison and Molière, Swift, Sterne, Fielding, and Smollett. Of individual paintings we may specify Sir Roger de Coverley going to Church, 1819; May-day in the Time of Queen Elizabeth, 1821; Sancho Panza and the Duchess, 1824; Uncle Toby and the Widow Wadman, 1831, *La Malinade Imaginaire*, act iii. sc. 6, 1843; and the Duke's Chaplain Enraged leaving the Table, from *Don Quixote*, 1840. Many of his more important subjects exist in varying replicas. He possessed a sympathetic imagination, which enabled him to enter freely into the spirit of the author whom he illustrated, a delicate perception for female beauty, an unflinching eye for character and its outward manifestation in face and figure, and a genial and sunny sense of humour, guided by an instinctive refinement which prevented it from overstepping the bounds of good taste. In 1821 Leslie was elected A.R.A., and five years later full academician. In 1833 he left for America to become teacher of drawing in the military academy at West Point, but the post proved an irksome one, and in some six months he returned to England, where he practised his profession with unflinching assiduity till his death on the 5th of May 1859.

In addition to his skill as an artist, Leslie was a ready and pleasant writer. His *Life of his friend Constable*, the landscape painter, appeared in 1845, and his *Handbook for Young Painters*, a volume embodying the substance of his lectures as professor of painting to the Royal Academy, in 1846. In 1860 Tom Taylor edited his *Autobiography and Letters*, which contain interesting reminiscences of his distinguished friends and contemporaries.

LESLIE, SIR JOHN (1766-1839), geometrical and physicist, was born of humble parents at Largo, Fifeshire, on April 16, 1766, received his early education there and at Leven, and in his thirteenth year, encouraged by friends who had even then remarked his aptitude for mathematical and physical science, entered the university of St Andrews. On the completion of his arts course, he nominally studied divinity at Edinburgh until 1787; in 1788-89 he spent rather more than a year as private tutor in a Virginian family, and from 1790 till the close of

1792 he held a similar appointment in Staffordshire, employing his spare time in experimental research and in preparing a translation of Buffon's *Natural History of Birds*, which was published in nine 8vo vols. in 1793, and brought him some money. For the next twelve years (passed chiefly in London or at Largo, with an occasional visit to the Continent) he continued his physical studies, which resulted in numerous papers contributed by him to Nicholson's *Philosophical Journal*, and in the publication (1804) of the *Experimental Inquiry into the Nature and Propagation of Heat*, a work which gained for its author the Rumford Medal of the Royal Society of London. In 1805 he was elected to succeed Playfair in the chair of mathematics at Edinburgh, not, however, without violent though unsuccessful opposition on the part of a narrow-minded clerical party who accused him of heresy in something he had said as to the "unsophisticated notions of mankind" about the relation of cause and effect. During his tenure of this chair he published two volumes of a *Course of Mathematics*—the first, entitled *Elements of Geometry, Geometrical Analysis, and Plane Trigonometry*, in 1809, and the second, *Geometrical Analysis, and Geometry of Curve Lines*, in 1821, the third volume, on "Descriptive Geometry" and the "Theory of Solids" was never completed. With reference to his invention (in 1810) of a process of artificial congelation, he published in 1813 *A Short Account of Experiments and Instruments depending on the relations of Air to Heat and Moisture*, and in close connexion with the subject of this treatise he also wrote a paper on the æthiopscope, which appeared in 1818 in the *Transactions of the Royal Society of Edinburgh*. In 1819, on the death of Playfair, he was promoted to the more congenial chair of natural philosophy, which he continued to hold until his death, and in 1823 he published, chiefly for the use of his class, the first volume of his never-completed *Elements of Natural Philosophy*. Leslie's main contributions to physics were made by the help of the "differential thermometer," an instrument whose invention was contested with him by Count Rumford. By adapting to this instrument various ingenious devices he was enabled to employ it in a great variety of investigations, connected especially with platiometry, hygrometry, and the temperature of space. In 1820 he had been elected a corresponding member of the Royal Institute of France, the only distinction of the kind which he valued, and early in 1832 he was, on the recommendation of Lord Chancellor Brougham, created a knight of the Guelphic order. He died at Coates, a small property which he had acquired near Largo, on November 3 of the same year.

LESLIE, THOMAS EDWARD CLIFFE (1827–1882), one of the ablest and most original English economists of the present century, was born in the county of Wexford (as is believed) the year 1827. He was the second son of the Rev. Edward Leslie, prebendary of Dromore, and rector of Annahilt, in the county of Down. His family was of Scotch descent, but had been connected with Ireland since the reign of Charles I. Amongst his ancestors were that accomplished and energetic prelate, John Leslie, bishop first of Raphoe and afterwards of Clogher, who, when holding the former see, offered so stubborn a resistance to the Cromwellian forces, and the bishop's son Charles, the well-known conjurer. Cliffe Leslie received his elementary education from his father, who resided in England, though holding church preferment as well as possessing some landed property in Ireland; by him he was taught Latin, Greek, and Hebrew, at an unusually early age; he was afterwards for a short time under the care of a clergyman at Clapham, and was then sent to King William's College, in the Isle of Man, where he remained until, in 1842, being then only fifteen years of age, he entered Trinity College,

Dublin. He was a distinguished student there, obtaining, besides other honours, a classical scholarship in 1845, and a senior moderatorship (gold medal) in mental and moral philosophy at his degree examination in 1846. He became a law student at Lincoln's Inn, was for two years a pupil in a conveyancer's chambers in London, and was called to the English bar. But his attention was soon turned from the pursuit of legal practice, for which he seems never to have had much inclination, by his appointment, in 1853, to the professorship of jurisprudence and political economy in Queen's College, Belfast. The duties of this chair requiring only short visits to Ireland in certain terms of each year, he continued to reside and prosecute his studies in London, and became a frequent writer on economic and social questions in the principal reviews and other periodicals. In 1870 he collected a number of his essays, adding several new ones, into a volume entitled *Land Systems and Industrial Economy of Ireland, England, and Continental Countries*. J. S. Mill gave a full account of the contents of this work in a paper in the *Fortnightly Review*, in which he pronounced Leslie to be "one of the best living writers on applied political economy." Mill had sought his acquaintance on reading his first article in *Macmillan's Magazine*; he admired his talents and took pleasure in his society, and treated him with a respect and kindness which Leslie always gratefully acknowledged.

In the frequent visits which Leslie made to the Continent, especially to Belgium and some of the less-known districts of France and Germany, he occupied himself much in economic and social observation, studying the effects of the institutions and system of life which prevailed in each region, on the material and moral condition of its inhabitants. In this way he gained an extensive and accurate acquaintance with Continental rural economy, of which he made excellent use in studying parallel phenomena at home. The accounts he gave of the results of his observations were among his happiest efforts; "no one," said Mill, "was able to write narratives of foreign visits at once so instructive and so interesting." In these excursions he made the acquaintance of several distinguished persons, amongst others of M. Léonce de Lavergne and M. Émile de Laveleye. To the memory of the former of these he afterwards paid a graceful tribute in a biographical sketch (*Fortnightly Review*, February 1881); and to the close of his life there existed between him and M. de Laveleye relations of mutual esteem and cordial intimacy.

Two essays of Leslie's appeared in volumes published under the auspices of the Cobden Club, one on the "Land System of France" (2d ed., 1870), containing an earnest defence of *la petite culture* and still more of *la petite propriété*; the other on "Financial Reform" (1871), in which he exhibited in detail the impediments to production and commerce arising from indirect taxation. Many other articles were contributed by him to reviews between 1875 and 1879, including several discussions of the history of prices and the movements of wages in Europe, and a sketch of life in Auvergne in his best manner, the most important of them, however, related to the philosophical method of political economy, notably a memorable one which appeared in the Dublin University periodical, *Hermathena*. In 1879 the provost and senior fellows of Trinity College published for him a volume in which a number of these articles were collected under the title of *Essays in Political and Moral Philosophy*. These and some later essays, which ought one day to be united with them, together with the earlier volume on *Land Systems*, form the essential contribution of Leslie to our economic literature. He had long contemplated, and had in part written, a work on English economic and legal history, which would have been his *magnum opus*—a more substantial fruit of his genius and

his labours than anything he has left to us. But the MS. of this treatise, after much pains had already been spent on it, was unaccountably lost at Nancy in 1872; and, though he hoped to be able speedily to reproduce the missing portion and finish the work, it is feared that but a small part of it, if any, was never left in a state fit for publication. What the nature of it would have been may be gathered from an essay on the "History and Future of Profit" in the *Fortnightly Review* for November 1881, which is believed to have been in substance an extract from it.

That he was able to do so much may well be a subject of wonder when it is known that his labours had long been impeded by a painful and depressing malady, from which he suffered severely at intervals, whilst he never felt secure from its recurring attacks. To this disease he in the end succumbed at Belfast, whither he had gone to discharge his professorial duties, on the 27th of January 1882, in the fifty-fifth year of his age.

Leaie's work may be distributed under two heads, that of applied political economy, and that of discussion on the philosophical method of the science. The *Land System* belonged principally to the former division. The author perceived the great and growing importance for the social welfare of both Ireland and England of what is called "the land question," and treated it in this volume at once with breadth of view and with a rich variety of illustrative detail. His general purpose was to show that the territorial systems of both countries were so encumbered with elements of feudal origin as to be altogether unfitted to serve the purposes of a modern industrial society. This policy he recommended is summed up in the following list of requirements, "a simple jurisprudence relating to land, a law of equal intestate succession, a prohibition of entail, a legal security for tenants' improvements, an open registration of title and transfer, and a considerable number of peasant properties." The volume is full of practical good sense, and exhibits a thorough knowledge of home and foreign agricultural economy; and in the handling of the subject is everywhere shown the special power which its author possessed of making that which is most interesting as well as instructive. The way in which sagacious observation and shrewd comment are constantly intermingled in the discussion not seldom reminds us of Adam Smith, whose manner was more congenial to Leaie than the sternest and arid style of Ricardo.

But what, more of the latter style, makes him an original thinker, and gives him a place apart among contemporary economists, is his exposition and defence of the historical method in political economy. Both at home and abroad there has for some time existed a profound and growing dissatisfaction with the method and many of the doctrines of the hitherto dominant school, which, it is alleged, under a "fictitious completeness, symmetry, and exactness" "disguise a real hollowiness and discordance with fact. It is urged that the attempt to deduce the economic phenomena of a society from the so-called universal principle of "the desire of wealth" is illusory, and that they cannot be fruitfully studied apart from the general social conditions and historic development of which they are the outcome. Of this movement of thought Leaie was the principal representative, if not the originator, in England. There is no doubt, for he has himself placed it on record, that the first influence which impelled him in the direction of the historical method was that of the German Master whose personal teaching of jurisprudence, as well as by the example of his writings, he was led "to look at the present economic structure and state of society as the result of a long evolution." The study of those German economists who represent similar tendencies doubtless confirmed him in the new line of thought on which he had entered, though he does not seem to have been further indebted to any of them except, perhaps, in some small degree to Roscher. And the writings of Comte, whose "prodigious genius," as exhibited in the *Philosophie Positive*, he admired and proclaimed, though he did not accept his system as a whole, must have powerfully co-operated to form in him the habit of regarding economic science as only a single branch of sociology, which should always be kept in close relation to the others. The earliest writing in which Leaie's revolt against the so-called "orthodox school" distinctly appears is his *Essay on Wages*, which was first published in 1868, and was reproduced as an appendix to the volume on *Land Tenure*. In this, after exposing the narrowness of the theory of the wage-fund, and showing the utter want of agreement between its results and the observed phenomena, he concludes by declaring that "political economy must be content to take rank as an inductive, instead of a purely deductive science," and that, by this change of character, "it will gain in utility, interest, and real truth far more than a full compensation for the forfeiture of a fictitious title to mathematical exactness and certainty." But it is

in the essays collected in the volume of 1879 that his attitude in relation to the question of method is most decisively marked. In one of these, on "the political economy of Adam Smith," he exhibits in a very interesting way the co-existence in the *Wealth of Nations* of historical-inductive investigation in the manner of Montesquieu with *a priori* speculation founded on theological-metaphysical bases, and points out the error of ignoring the former element, which is the really characteristic feature of Smith's social philosophy, and places him in strong contrast with his *so-disputed* followers of the school of Ricardo. The essay, however, which contains the most brilliant polemic against the "orthodox" school, as well as the most luminous account and the most powerful indication of the new direction, was that of which we have above spoken as having first appeared in *Hornet*. It may be recommended as supplying the best extant presentation of one of the two contending views of economic method. On this essay mainly rests the claim of Leaie to be regarded as the founder and first head of the English historical school of political economy. How far his opinions on the philosophical constitution of the science are destined to prevail must for the present remain doubtful. Those who share his views on that subject regard the work he did, notwithstanding its unsystematic character, as in reality the most important done by any recent English economist. But even the warmest partisans of the older school are ready to acknowledge that he has done excellent service by insisting on a kind of inquiry, hitherto too much neglected, which is of the highest interest and value, in whatever relation it may be supposed to stand to the establishment of economic truth. The members of both groups alike recognize his great learning, his patient and conscientious habits of investigation, and the large social spirit in which he treated the problems of his science. (J K I)

LESSING, GOTTHOLD EPHRAIM (1729-1781), was born at Kamenz, in Upper Lusatia, Saxony, on the 22d of January 1729. He was descended from Clemens Lessing, a Saxon clergyman, whose name is found attached to an ecclesiastical document of 1580. Lessing's father, Johann Gotthard, born in 1693, was the son of Theophilus Lessing, the burgo-master of Kamenz, who died at the age of eighty-nine, when Lessing was between six and seven years old. At the time of Lessing's birth his father was one of the clergymen of Kamenz, where, a few years afterwards, he became pastor primarius, or head pastor. He was a man of high character, rather inascible, but earnest in the fulfilment of his pastoral duties, and universally beloved for his kindness to the poor. Throughout life he continued the studies in theology and church history which he had successfully begun at the university of Wittenberg, and he made some reputation as an original writer and as a translator of Tillotson. Of the Frau Pastorin we do not know much except that she was a faithful and affectionate wife and mother. They had twelve children, of whom Lessing was the second who survived infancy. He seems to have been an exceedingly happy child, healthy and playful, and already remarkable for his fondness for reading. After attending the Latin school of Kamenz, he was sent in 1741 to the great school of St. Afra at Meissen, where he was maintained free of charge. Here he made such rapid progress in classical and mathematical study that, towards the end of his career as a pupil, he was described by the rector as "a steed that needed double fodder." Work which was oppressive to others, added the rector, was to Lessing "as light as a feather." He had the reputation of being one of the most sarcastic, but at the same time one of the most loyal and generous, boys in the school. In 1746 he left St. Afra's and went to the university of Leipzig, nominally for the purpose of studying theology. To theology, however, he did not give the slightest attention. Under Professors Christ and Ernesti he continued his classical studies, and he also attended the philosophical disputations presided over by his friend Kastner, a young professor of mathematics. For some time Lessing was shy and retired amid his new surroundings, but being of an eminently social disposition he soon became tired of this kind of life, and began to form friends among his fellow-students, and strove to acquire the manners of a free and polished man of the world. His

principal friend was Weisse, who afterwards attained a respectable position as a man of letters. He also became intimate with Mylius, who was considerably older than himself, and had made a certain mark as a literary and scientific writer. There was at this time in Leipzig an excellent actress, Frau Neuber, who had gathered around her a number of respectable players, and Lessing, in company with Weisse, was one of the most regular attenders at her theatre. At St. Afra's he had begun a comedy, *Der Junge Gelehrte*, and this he now completed. Frau Neuber immediately accepted it, and it was received with much favour by the public of Leipzig.

Alarmed by reports of what was supposed to be his dissolute life, the elder Lessing summoned him to Kamenz, where he remained for some months. He soon succeeded in overcoming the fears of his parents, who allowed him to return to Leipzig on condition that he would devote himself to the study of medicine. Some medical lectures he did attend, but his ambition was to become a great dramatist, and as long as Frau Neuber's company kept together he occupied himself almost exclusively with the theatre, being frequently present at rehearsal during the day as well as at the performance in the evening.

In 1748 the company broke up, and Lessing, finding nothing to interest him in Leipzig, went to Wittenberg, and afterwards, towards the end of the year, to Berlin, where his friend Mylius had established himself as a journalist and man of science. In Berlin Lessing now spent three years, maintaining himself chiefly by literary work. He translated two volumes of Rollin's history, wrote some of the best of his early plays, and, in association with Mylius, started a periodical (which soon came to an end) for the discussion of matters connected with the drama. Early in 1751 he accepted the office of literary critic to the *Voss Gazette*, and in this position he reviewed some of the most important German and French books of the day, manifesting already to some extent the learning, judgment, and wit which were to make him the greatest critic of modern times. His father had been bitterly opposed to his scheme of life, and in 1751 urged him to complete his studies at the university of Wittenberg. Feeling the need of further thought and research, Lessing at last consented, and at the close of the year left Berlin. It is worthy of note that he had been brought into slight contact with Voltaire, for whom he had translated some documents relating to the Hirsch trial. Voltaire's secretary having lent him a volume of the *Siecle de Louis XIV.*, which had not yet been published, he took it with him to Wittenberg. This came to the ears of Voltaire, who assumed that Lessing intended to print either a pirated edition or an unauthorized translation. The affair led to an angry correspondence, and was a subject of much talk in Berlin.

Lessing remained about a year in Wittenberg, where he passed most of his time in the university library, every volume in which, he afterwards declared, had passed through his hands. Having taken the degree of master of arts, he returned to Berlin, determined to make literature his profession; and the next three years were among the busiest of his life. Besides translating for the booksellers, he issued several numbers of the *Theatralische Bibliothek*, a periodical essentially the same as that which he had begun with Mylius. He also resumed his labours as critic to the *Voss Gazette*. For many years the most influential writer in Germany had been Gottsched, the Leipzig professor, who continually proclaimed the necessity of rigid adherence, in the drama and in poetry, to French rules. In his articles for the *Voss Gazette*, Lessing made it his principal object to ridicule the pretensions of Gottsched and his school, and in a short time there was no writer of whom

they were so much afraid. In 1754 he produced a deep impression by *Ein Vade Mecum für den Herrn Sam. Gottl. Lange*, in which he exposed with bitter satire Lange's errors in his popular translation of Horace. During these three years Lessing took a definite position in contemporary literature by issuing, in six small volumes, those of his writings which he considered worthy of preservation. They included his lyrics and epigrams, some of the latter being in German, others in Latin. Most of his lyrics were written in Leipzig, and had already appeared, during his first residence in Berlin, in a volume of *Kleinigkeiten*, published without his name. Although they do not, like Goethe's lyrics, touch deep sources of natural feeling, they have the merit of being bright, gay, and musical, and some of them are still sung by German students. The epigrams, many of which were produced in Wittenberg, are in the style of Martial, and give evidence, like Lessing's critical writings, of a keen and biting humour. Among his collected writings there was also a remarkable series of *Letters*, in which, for the first time in German literature, some of the results of extensive learning were presented in a free and vivid style. Even more important, perhaps, were the papers entitled *Rettungen*, in which he undertook to vindicate the character of various writers who had been misunderstood by preceding generations. One of the best of these *Rettungen* is on Horace, whom he defends against the critics who charge him with sensuality and cowardice. In another, almost equally good, he shows that Cardan, instead of being an atheist, did full justice to the evidences for Christianity, as they were understood in his time, while he did rather less than justice to other religions. This essay contains a powerful argument in favour of Mohammedanism, developed from the point of view of an intelligent believer in the Prophet. In addition to these varied contents, Lessing published in the six volumes of his *Schriften* his early plays and *Miss Sara Sampson*. Of the former the chief are *Der Junge Gelehrte*, already mentioned, *Der Freidenker*, *Das Judentum*, and *Der Misogyn*. Although superior to any other German comedies produced at the same time, they cannot be said to reveal a high dramatic faculty. In the arrangement of his plots and the balancing of his characters, Lessing follows closely the methods of contemporary French comedy, and in the dialogue there is often a too obvious straining after effect. *Miss Sara Sampson*, written in 1755, marks a wholly different stage of his development. It has many faults both in conception and in execution, but it exercised a powerful influence by indicating to the dramatists of Germany that materials for tragedy are to be found in the experiences of ordinary men and women as well as in those of "the great." Lessing attributed much importance to this principle, which had been suggested to him chiefly by the study of Richardson, whose *Clarissa* is almost exactly reproduced in the heroine of *Miss Sara Sampson*.

This tragedy, when represented in Frankfurt-on-the-Oder, was received with so much applause that he resolved to devote himself to the drama; and in fulfilment of his design he suddenly quitted Berlin in October 1755, and went to Leipzig, where a good theatre had been lately established. During his second residence in Berlin he had made his name widely known, and he had secured several friends, whose affection he retained during the rest of his life. The chief of these was Moses Mendelssohn, in association with whom, in 1755, he wrote an admirable treatise, *Pope ein Metaphysiker*, tracing sharply the lines which separate the poet from the philosopher. The Berlin Academy of Sciences had offered a prize for the best essay on Pope's doctrine that "Whatever is, is right," as compared with the optimism of Leibnitz. The treatise of the two friends was written to show that there cannot be a

true comparison between a poetic and a philosophic conception, and they threw much light on the aims both of Leibnitz and of Pope. Other Berlin friends of Lessing were Nicolai, the bookseller, and Ramler, the author of many well-known odes. He had also made the acquaintance of Gleim, the Halberstadt poet, and Ewald Christian von Kleist, a Prussian officer, whose fine poem, *Der Frühling*, had won for him Lessing's warm esteem.

In Leipzig, Lessing was asked by Winkler, a wealthy young merchant, to accompany him in a foreign tour, which was to last three years. As he offered liberal terms, Lessing consented; and early in the summer of 1756 they started for England. They did not, however, get beyond Amsterdam, for after the outbreak of the Seven Years' War they heard that Winkler's house was occupied by the Prussian commandant, and he deemed it necessary to hasten back. After some time Winkler was offended by Lessing's intimacy with certain Prussian officers, and suddenly announced to him that he must consider their engagement at an end. Lessing demanded compensation, and in the end the courts decided in his favour, but not until the case had dragged on for about six years. In the meantime it detained him in Leipzig, and, as there was little opportunity for earning money by literature in a city occupied by foreign troops, he went through a period of extreme hardship. During these anxious months he began the study of mediæval poetry, in which some interest had been awakened by the Swiss school of critics; he also translated several English writings, and worked occasionally for the *Bibliothek*, a periodical edited by Nicolai. Fortunately he had an opportunity of developing his friendship with Kleist, who happened to be stationed in Leipzig. Kleist, a man of truly heroic temper, with the simplicity of a child, was powerfully attracted by Lessing's frank and noble nature, and Lessing loved him with an ardour which was excited by no other friend, not even by Mendelssohn. Kleist's regiment being ordered to new quarters early in 1758, Lessing decided not to remain behind him, and, saying farewell to his friend (who was mortally wounded in the following year at the battle of Kunersdorf), he returned once more to Berlin.

His third residence in Berlin was made memorable by the *Literaturbriefe*, a series of critical essays (written in the form of letters to a wounded officer) on the principal works that had appeared since the beginning of the Seven Years' War. The scheme was suggested by Nicolai, by whom the letters were published. Those written by Lessing manifested far higher intellectual power than anything he had yet accomplished. The critical principles set forth in the *Literaturbriefe* are now universally recognized, but they were then new, and even at the present day they seem to derive fresh vitality from the force, precision, and animation with which he expresses them. He insisted especially on the necessity of truth to nature in the imaginative presentation of the facts of life, and in one letter he boldly proclaimed the superiority of Shakespeare to Corneille, Racine, and Voltaire. At the same time he marked the immutable conditions to which even genius must submit in order to move enduring sympathies. While in Berlin at this time, he edited with Ramler a selection from the writings of Logau, a vigorous epigrammatist of the 17th century, and introduced to the German public *The War Songs of a Grenadier*, by Gleim. He admired the vigour of these songs, but in several private letters protested against the vehemence of the author's patriotism—patriotism being a virtue which, he thought, he "could do very well without." In 1759 he published *Philotas*, a prose tragedy; and in the same year appeared a complete collection of his fables, with an essay on the essential idea of the fable. The latter is one of his

best essays in criticism, defining with perfect lucidity what is meant by "the action" in works of imagination, and distinguishing the action of the fable on the one hand from that of the epic and the drama on the other. His theory prevented him from lending poetic interest to his own fables, but they surpass the works of all other German fabulists in the depth and variety of the moral truths which they are intended to enforce.

In 1760, weary of incessant writing, and feeling that change of scene and work was necessary for his health, Lessing went to Breslau to apply for the post of secretary to General Tauentzien, to whom Kleist had introduced him in Leipzig. Tauentzien was not only a general in the Prussian army, but governor of Breslau, and director of the mint. He willingly granted the vacant office to Lessing, who retained it for more than four years. He thus found himself in circumstances wholly different from those to which he had been hitherto accustomed. He associated chiefly with Prussian officers, went much into society, and became passionately fond of the gaming table, where he played for such high stakes that even General Tauentzien expostulated with him. While, however, he seemed to be wasting his energies, he never lost sight of his true goal. He gradually collected a library of about 6000 volumes (which he was ultimately obliged to sell); and after the conclusion of the Seven Years' War in 1763 he resumed more enthusiastically than ever the studies which had been partly interrupted. In investigating the early history of Christianity, he obtained a profound knowledge of the fathers; and a remarkable letter to Mendelssohn shows that he had penetrated more deeply than any contemporary thinker into the significance of the philosophy of Spinoza. In 1764 he was prostrated by a severe illness, during which he reviewed, in a rather sorrowful spirit, his past life, and formed many serious resolutions for the future. Before this time he had worked hard at *Lacoon*, and in fresh spring mornings he had sketched in a garden the plan of *Mimna von Barnhelm*. His parents were now in exceedingly straitened circumstances, and often appealed to him for aid. He responded generously to their demands, but they greatly overrated his power to help them, as they assumed that he intended to remain permanently in General Tauentzien's service. In reality, he had always regarded the engagement as a temporary one, and in 1766 he resigned his office, and left Breslau.

It seemed not improbable that he might find a suitable appointment in Dresden, but he was again compelled, much against his will, to become a resident of Berlin, whither he went after a brief visit to Kamenz and Leipzig. His friends exerted themselves to obtain for him the office of keeper of the royal library, but Frederick had not forgotten Lessing's quarrel with Voltaire, and declined to consider his claims, although, about the time when Lessing went to Breslau, he had confirmed his election as a foreign member of the Berlin Academy of Sciences. During the two years which Lessing now spent in the Prussian capital he was restless and unhappy, yet it was during this period that he published two of his greatest works—*Lacoon* in 1766, and *Mimna von Barnhelm* in 1767. *Lacoon* ranks as a classic not only in German but in European literature, and its style alone, which is as near perfection as anything Lessing ever wrote, would almost entitle it to this position. His central aim is to define by analysis the limitations of poetry and the plastic arts. Many of his conclusions have been corrected and extended by later criticism; but he indicated more decisively than any of his predecessors the fruitful principle that each art is subject to definite conditions, and that it can accomplish great results only by limiting itself to its special function. The most valuable parts of the work are those which relate to poetry, of which he had a

much more intimate knowledge than of sculpture and painting. His exposition of the methods of Homer and Sophocles is especially suggestive, and he may be said to have marked an epoch in the appreciation of these writers, and of Greek literature generally. He invariably starts from the consideration of doctrines set forth by other scholars (chiefly Winkelmann, Caylus, and Spence); but he is never satisfied until he arrives at positive principles, and he leads us towards them gradually by the paths he himself has trodden, glancing at many side issues by the way. He was unable in later years to complete his scheme, but even in its fragmentary form, as Goethe testifies in *Wahrheit und Dichtung*, *Lacoon* was welcomed with gratitude by the most active minds of the age. The power of *Minna von Barnhelm* was also immediately recognized. This is, on the whole, the best of Lessing's purely dramatic writings. The hero, Tellheim, is an admirable study of a manly and sensitive soldier, with somewhat exaggerated ideas of conventional honour; and Minna, the heroine, is one of the brightest and most attractive figures in the dramatic literature of Germany. The subordinate characters are conceived with the same force and vividness, and the plot, which reflects precisely the struggles and aspirations of the period that immediately followed the Seven Years' War, is simply and naturally unfolded. This beautiful play is valued by the Germans, not only as a work of art, but as one of the earliest and most striking manifestations of the growing spirit of German nationality.

In 1767 Lessing settled in Hamburg, where he had been invited to take part in the institution of a national theatre. The scheme promised well, and, as he associated himself with Bode, a literary man whom he respected, in starting a printing establishment, he hoped that he might at last look forward to a peaceful and prosperous career. The theatre, however, being mismanaged, was soon closed, while the printing establishment failed, and was left behind it a heavy burden of debt. Many of Lessing's letters from Hamburg breathe almost a spirit of despair, and towards the end of his residence there he determined to quit Germany, believing that in Italy he might find congenial labour that would suffice for his wants. Even in Hamburg he made splendid contributions to enduring literature, the chief being his *Hamburgische Dramaturgie*. It consists of criticisms of some of the plays represented in the Hamburg theatre; but in these criticisms he offers a complete theory of the laws of dramatic art. In the main his theory is that of Aristotle, but it is maintained on independent grounds and applied in new ways. By this powerful work he delivered German dramatists for ever from the yoke of the classic tragedy of France, and directed them to the Greek dramatists and to Shakespeare as the poets who have opened most truly the fountain of tragic feeling. Another result of his labours in Hamburg was the *Antiquarische Briefe*, a series of masterly letters in answer to Klotz, a pedantic writer who, after flattery Lessing, had attacked him, and sought to establish a kind of intellectual despotism by means of critical journals which he directly or indirectly controlled. In connexion with this controversy, Lessing wrote his brilliant little treatise, *Wie die Alten den Tod gebildet*, contrasting the mediæval representation of death as a skeleton with the Greek conception of death as the twin-brother of sleep.

Instead of going to Italy as he intended, Lessing accepted, in 1770, the office of librarian at Wolfenbützel, a post which was offered to him by the hereditary prince of Brunswick. In this position he passed his remaining years. For a time he was not unhappy, but by and by he was rendered miserable by his inability to pay the debts which he had contracted in Hamburg. He missed, too, the society of his friends, and his health, which had

hitherto been excellent, gradually gave way. In 1778 he travelled for nine months in Italy with Prince Leopold of Brunswick; and in the following year he married Eva Koenig, the widow of a Hamburg merchant, with whom he had been on terms of intimate friendship. She was in every way worthy of Lessing, and their correspondence during his lonely years in Wolfenbützel forms one of the most attractive elements of his biography. Their happiness in each other was perfect, but it lasted only for a brief period, in 1778 she died in childbirth. After her death Lessing found one of his chief sources of consolation in the love of his four step-children, to whom he was tenderly attached.

Meanwhile he had extended his fame by several important writings. Soon after settling in Wolfenbützel he found in the library an ancient manuscript, which proved to be a treatise of Berengarius of Tours on transubstantiation in reply to Lanfranc. Lessing was thus induced to write an essay on Berengarius, vindicating his character as a serious and consistent thinker. The essay was much admired by the leading theologians of Germany, and it is, on the whole, the ablest and most interesting of his *Religionen*. In 1771 he published his *Verstreute Anmerkungen über das Epigramm, und einige der vornehmsten Epigrammatisten*—a work which Herder described as "itself an epigram." Lessing's theory of the origin of the epigram is somewhat fanciful, but no other critic has offered so many pregnant hints as to the laws of epigrammatic verse, or defended with so much force and ingenuity the character of Martial. In 1772 lovers of the drama were delighted by the appearance of *Emilia Galotti*, a tragedy which he had begun many years before in Leipzig. The subject was suggested by the Roman legend of Virginia, but the scene is laid in an Italian court, and the whole play is conceived in accordance with the modern spirit. Its defect is that its tragic conclusion does not seem to be absolutely inevitable, but there is high imaginative power in the character of the prince of Gaetana, and in that of Marcell, his chamberlain, who weaves the intrigue from which Emilia escapes by death. The diction of *Emilia Galotti* is at once refined and vigorous, and there are scenes in which some of the deepest passions of human nature are sounded with perfect art. Having completed *Emilia Galotti*, Lessing occupied himself for some years almost exclusively with the treasures of the Wolfenbützel library. The results of his researches (some of them of high value) he embodied in a series of volumes, *Zur Geschichte und Literatur*, the first being issued in 1773, the last in the year of his death.

The concluding period of Lessing's life was devoted chiefly to theological controversy. Reimarus, professor of Oriental languages in Hamburg, who commanded general respect as a scholar and thinker, wrote a book entitled *Apologie oder Schutzschrift für die vernünftigen Verehrer Gottes*. The standpoint of Reimarus was that of the English deists, and he investigated, without hesitation, the evidence for the miracles recorded in the Bible. The manuscript of this work, after the author's death in 1767, was entrusted by his daughter, Elise Reimarus, to Lessing, who published extracts from it in his *Zur Geschichte und Literatur*, in 1774-78. These extracts, the authorship of which was not publicly avowed, were known as the "Wolfenbützel Fragments." They created profound excitement among orthodox theologians, and evoked many replies, in which Lessing was bitterly condemned for having issued writings of so dangerous a tendency. Lessing delighted at all times in the stir of combat, and prepared to offer a full and vigorous defence. His most formidable assailant was Pastor Goese, of Hamburg, a sincere and earnest theologian, but utterly unscrupulous in his choice of weapons against

an opponent. To him, therefore, Lessing addressed his most elaborate answers, — *Ense Parabel, Axiomata*, eleven letters with the title *Anti-Goeze*, and two pamphlets in reply to an inquiry by Goeze as to what Lessing meant by Christianity. These papers are not only full of thought and learning; they are written with a grace, vivacity, and energy that make them hardly less interesting to-day than they were to Lessing's contemporaries. He does not undertake to defend the conclusions of Reimarus; his immediate object is to claim the right of free criticism in regard even to the highest subjects of human thought. The argument on which he chiefly relies is that the Bible cannot be considered necessary to a belief in Christianity, since Christianity was a living and conquering power before the New Testament in its present form was recognized by the church. The true evidence for what is essential in Christianity, he contends, is its adaptation to the wants of human nature, hence the religious spirit is undisturbed by the speculations and researches of the boldest thinkers. The effect of this controversy was to secure wider freedom for writers on theology, and to suggest new problems regarding the growth of Christianity, the formation of the canon, and the essence of religion. On one subject, the origin of the gospels, Lessing poured a flood of fresh light in a treatise, published after his death, presenting "A New Hypothesis concerning the Evangelists, regarded as merely human writers." The Brunswick Government having, in deference to the consistory, confiscated the "Fragments" and ordered Lessing to discontinue the controversy, he resolved, as he wrote to Elise Reimarus, to "try whether they would let him preach undisturbed from his old pulpit, the stage." In *Nathan der Weise*, written in the winter of 1778-79, he gave poetic form to the ideas which he had already developed in prose. Its governing conception is that noble character may be associated with the most diverse creeds, and that there can, therefore, be no good reason why the holders of one set of religious principles should not tolerate those who maintain wholly different doctrines. This element of *Nathan der Weise* receives so much attention from its critics that many of them overlook the high artistic qualities of the work. As a play it has serious imperfections, but as a dramatic poem it is one of the finest creations of the 18th century. The characters possess true vitality, and several passages (including, of course, the famous passage setting forth the parable of the three rings) have both the depth and the spontaneity which are the unmistakable notes of genius. In 1780 appeared *Die Erziehung des Menschengeschlechts*, the first half of which he had published in 1777 with one of the "Fragments." This work, composed of a hundred brief paragraphs, was the last, and is, perhaps, the most suggestive, of Lessing's writings. The doctrine on which its argument is based is that no dogmatic creed can be regarded as final, but that every historical religion has played a great part in the development of the spiritual life of mankind. Lessing also maintains that history reveals a definite law of progress, and that occasional retrogression may be necessary for the advance of the world towards its ultimate goal. These ideas afterwards became familiar, but they offered a striking contrast to the principles both of orthodox and of sceptical writers in Lessing's day, and gave a wholly new direction to religious philosophy. Another work of Lessing's last years, *Ernst und Falk* (a series of five dialogues, of which the first three were published in 1777, the last two in 1780), also indicated in a fascinating style many new points of view. Its nominal subject is freemasonry, but its real aim is to plead for a humane and charitable spirit in opposition to a narrow patriotism, an extravagant respect for rank, and exclusive devotion to any particular church.

Lessing's theological opinions exposed him to much petty persecution, and he was in almost constant straits for money. Nothing, however, broke his manly and generous spirit. To the end he was always ready to help those who appealed to him for aid, and he devoted himself with growing ardour to the search for truth. He formed many new plans of work, but in the course of 1780 it became evident to his friends that he would not be able much longer to continue his labours. His health had been undermined by excessive work and anxiety, and after a short illness he died at Brunswick on the 22d of January 1781.

He was rather above the middle height, and during the greater part of his life maintained an appearance of vigour and elasticity. Luther himself was not of a more fearless and independent character. In an age when men of letters were fond of grouping themselves in sects and coteries, Lessing pursued his own way, unmoved by clamour, and indifferent to popular favour. Yet no man was ever more warmly loved by friends, and he had the satisfaction of knowing that the younger generation of writers looked up to him with confidence and reverence. Jacobi wished for many years to make his acquaintance, but was deterred from addressing him, as he explained to Lessing, by a profound consciousness of the difference between himself and one whom he regarded as "a king among minds." "We lose much, much in him," wrote Goethe after Lessing's death, "more than we think." It may be questioned whether there is any other writer to whom the Germans owe a deeper debt of gratitude. He was succeeded by poets and philosophers who for a time gave Germany the first place in the intellectual life of the world, and it was Lessing, as they themselves acknowledged, who prepared the way for their achievements. Without attaching himself to any particular system of philosophical doctrine, he fought incessantly against error, and in regard to art, poetry, the drama, and religion, suggested ideas which kindled the enthusiasm of aspiring minds, and stimulated their highest energies. While his work was thus effective in its own day, it has lost little of its value for later ages. His great dramas have imaginative qualities which appeal to every generation, and an unfading charm is conferred on his critical and theological writings by the power and classical purity of his style.

The first edition of his collected works appeared, in 8 vols., in 1771-94. A critical edition by Lachmann, in 18 vols., was issued in 1838-40, and this edition was revised, with additions, by Maltzahn in 1863-57. In 1868-77 Lessing's works, edited by several competent scholars, were published in 20 vols. by Hempel, and there is an illustrated edition in 8 vols. (Grote, 1876-70). See *Lessing's Leben*, 1793, by Karl G. Lessing (his brother); Daniel, *G. E. Lessing, sein Leben und seine Werke*, 1850 (completed by Gubauer, 1858-59); Stahl, *G. E. Lessing, sein Leben und seine Werke*, 1859; H. Duncker, *Lessing's Leben*, 1882; and in English, J. Sims, *Lessing*, 1877, and H. Zimmer, *Goethold Zeyher's Lessing*, 1878. (J. SL.)

L'ESTRANGE, SIR ROBERT (1616-1704), an indefatigable pamphleteer on the royalist and court side during the Restoration epoch, but principally remarkable as the first Englishman of letters of any distinction who made journalism a profession, was born at Hunstanton in Norfolk, December 17, 1616. In 1644, during the civil war, he headed a conspiracy to seize the town of Lynn for the king, under circumstances which led to his being condemned to death as a spy. The sentence, however, was not executed, and after four years' imprisonment in Newgate he escaped to the Continent. He was excluded from the Act of Indemnity, but in 1653 was pardoned by Cromwell upon his personal solicitation, and lived quietly until the Restoration, when after some delay his services and sufferings were acknowledged by his appointment as licenser of the press. This office was administered by him in the

spirit which might be expected from a zealous cavalier. He made himself notorious, not merely by the severity of his literary censorship, but by his vigilance in the suppression of clandestine printing. The monstrosity of this course with his actions and professions when himself opposed to the party in power naturally aggravated the unpopularity inevitably attaching to his office. Few men have been more heartily abused than L'Estrange, and it is undoubtedly true that the rights of free speaking and printing, the indispensable conditions of civil and religious liberty, have seldom had a more determined or more dangerous opponent. At the same time there is no ground for questioning his integrity, and he was probably no more intolerant than any similar official of any Government in that day, inspired by an equal strength of conviction, would have been in his place. The representation of him in Grant's *History of the Newspaper Press* as a mere political hireling is entirely contrary to truth. He was a militant loyalist, who used the pen as he had been wont to use the sword, and proved his zeal for his party by the production of a mass of pamphlet literature, above the ordinary standard of the time in ability, and quite on a par with it in virulence and coarseness. These productions still possess an historical value, but their titles are not worth enumerating here. His memory is more honourably preserved by his connexion as an author with the journalism which as a licenser he laboured to cripple and amputate. In 1663 he commenced the publication of *The Public Intelligencer and the News*, succeeded in February 1665 by *The London Gazette*, not to be confounded with the official journal still existing, which appeared for the first time at the close of that year, and was at first printed at Oxford. In 1679 he established *The Observer*, a journal specially designed to vindicate the court from the charge of a secret inclination to popery. This line of political controversy, and it may be hoped some natural humanity and good sense as well, obliged him to discredit the Popish Plot, and he manfully resisted the delusion by which many wiser and better men were carried away. The suspicion he thus incurred was increased by the conversion of his daughter to Romanism, but there seems no reason to question the sincerity of his own attachment to the Church of England. In 1687 he gave a further proof of independence by discontinuing *The Observer* from his unwillingness to advocate James II.'s Edict of Toleration, although he had previously gone all lengths in support of the measures of the court. The Revolution cost him his office as licenser, and the remainder of his life was spent in obscurity. He died in 1704. L'Estrange's place is rather in history than in literature. The importance of the part he played as licenser would be more exactly known if it could be more accurately ascertained how much literature he may have been the means of suppressing. The post he held so long was in itself an unmitigated mischief, but at the same time an evil which men of all parties, with the rare exception of men so far in advance of their time as Milton, then deemed necessary; and no obloquy should attach to L'Estrange for having discharged its functions with zeal and efficiency. As a pamphleteer he is but slightly above mediocrity, and he labours under a special imputation of having contributed to corrupt his native language. The same charge is brought against journalists in all ages, and there are obvious reasons why it should be true to a certain extent. The practice of daily writing for the press is undoubtedly one of the numerous forces which tend to wear down and degrade a language, but it also keeps the diction of the cultivated classes in contact with the speech of the people, and prevents the absolute divorce between them which seems to have existed in ancient times. It is to L'Estrange's credit that among the agitations of a busy

political life he should have found time for much purely literary work as a translator of Josephus, Cicero, Seneca, Quevedo, and other standard authors. (R. G.)

LESUEUR, JEAN FRANÇOIS (1763-1837), was born near Abbeville in 1763, and studied music under Roze at the college of Amiens. Appointed choirmaster of a church in Paris in 1784, he completed his musical education under Sacchini. In 1780 Lesueur obtained by open competition the musical directorship of Notre-Dame, where he gave successful performances of sacred music with a full orchestra. This place he resigned in 1788; and, after a retirement of five years in a friend's country house, he produced *La Caverne* and two other operas at the theatre Feytaud in Paris. At the foundation of the Paris Conservatoire (1795) Lesueur was appointed one of its inspectors of studies, but was dismissed in 1802, owing to his disagreements with Mehul. On the recommendation of Paisiello, Lesueur succeeded this celebrated composer as *Maestro di cappella* to Napoleon, and produced (1804) his *Ossian* at the Opera. He also composed for the emperor's coronation a mass and a Te Deum. Louis XVIII., who had retained Lesueur in his court, appointed him (1818) professor of composition at the Conservatoire, and at this institution he had, among many other pupils, Hector Berlioz, Ambroise Thomas, Bazzani, and Gounod. He died October 6, 1837. Lesueur composed eight operas and several masses, and other sacred music. All his works are written in a style of rigorous simplicity; and to this may be ascribed their want of popularity at the present time.

LETHE (Λήθη, oblivion) is sometimes used as the name of a river in the infernal regions. It seems to have been an idea current in the religion of the mystics that there were in the lower world two streams, one of memory and one of oblivion. The initiated were taught to distinguish between them, and directions for this purpose written on a gold plate have been found in a tomb at Pettia, buried doubtless with some initiated person. So beside Lethæ, at the oracle of Trophonius, which was counted an entrance to the lower world, the two springs Mnemosyne and Lethe were shown. This thought begins to appear in literature in the end of the 5th century a.c., when Aristophanes (*Frogs*, 186) speaks of the plain of Lethæ. Plato (*Rep.*, x.) embodies the idea in one of his finest myths of the future life. It is difficult to find any passage in the earlier writers showing acquaintance with this idea. Hesiod makes Lethe one of the children of Eris, along with Toil, Hunger, Pain, &c.; but his meaning probably is that ingratitude and forgetfulness spring from strife. In the epitaph on Anacreon attributed to Simonides, but reckoned by Bergk spurious, the expression Λήθη ἔδωκε occurs; but even if the epigram be an early one it is not certain that the words have any mythological sense.

LETRONNE, JEAN ANTOINE (1787-1848), French archaeologist, was born at Paris on January 2, 1787. His father, a poor engraver, having chosen the profession of an artist for him, sent him to the studio of David, but his own tastes drew him towards literature, and he became a student in the Collège de France, where it is said he used to exercise his already strongly developed faculty of critical divination by correcting for his own amusement old and bad texts of Greek authors, afterwards comparing the results he had thus obtained with the latest and most approved editions. From 1810 to 1812 he travelled in France, Switzerland, and Italy, and on his return to Paris published an *Essai critique sur la topographie de Syracuse* (1812), designed to elucidate Thucydides; two years later appeared his *Recherches géographiques et critiques on the De Mensura Cruiis Terre* of Dicaul, along with a restored text. In 1815 he was appointed by Government to com-

plete the translation of Strabo (1805-1819) which had been begun by Laporte-Dutheil, and in March 1816 he was one of those who were admitted to the Academy of Inscriptions by royal ordinance, having previously contributed a *Mémoire*, "On the Metrical System of the Egyptians," which had been crowned. Further promotion came rapidly; in 1817 he was appointed director of the École des Chartes, in 1819 inspector-general of the university, and in 1831 professor of history in the Collège de France. Thus chair he exchanged in 1838 for that of archaeology, and in 1840 he succeeded Daunou as keeper of the national archives. Meanwhile he had published, among other works, *Considérations générales sur l'évaluation des monnaies grecques et romaines et sur la valeur de l'or et de l'argent avant la découverte de l'Amérique* (1817), *Recherches pour servir à l'histoire d'Égypte pendant la domination des Grecs et des Romains* (1823), and *Sur l'origine Grecque des zodiaques prétendus égyptiens* (1837); by the last-named he finally exploded a fallacy which had up to that time vitiated the chronology of contemporary Egyptologists. His *Diplômes et chartes de l'époque Mérovingienne sur papyrus et sur velin* were published in 1844. The most important work of Letronne is the *Recueil des inscriptions grecques et latines de l'Égypte*, of which the first volume appeared in 1842, and the second in 1848. He died at Paris on December 14, 1848.

LETTRES DE CACHET are really *lettres closes*, that is, letters sealed in such a way that they cannot be opened without breaking the seal, and which were originally always addressed to individuals, in contradistinction to *lettres patentes*, or letters patent, beginning "know all men by these presents." Lettres closes interfering with the administration of justice or the liberty of the subject were forbidden by numerous edicts in the 14th, 15th, and 16th centuries, and the term *lettres de cachet*, as synonymous with *lettres closes*, is first found in the ordinance of Orleans in 1660. The convenience of such a means to consign one's enemies to prison was seen by Richelieu and Mazarin, who followed the Guise Government in using them frequently, despite numerous protestations on the part of the parlements, of which the most notable was when in 1648 an ordinance was registered that no man should be kept in prison three days without interrogation. When once Louis XIV. had begun to rule, he made frequent use of *lettres de cachet* both for state purposes and to control and disorganize his nobility, and he boldly justified their use in an edict of 1705. But the most marked justification is to be found in the circular letter addressed to the parlements of France in reply to protests against arbitrary imprisonment in 1769, in which the king says that "he reserves arbitrary orders—in other words, *lettres de cachet*—for occasions wherein they may be necessary for the public good and the interests of families." In this remark he distinguishes between the two purposes for which such letters were granted. He first alleges state reasons why he should have power to arrest arbitrarily—a power no one would deny to the executive on occasions of emergency, if used under proper restrictions. Secondly, he says that they are issued in the interest of families, and here he touches the great source of their injustice and unpopularity. It was the custom for the king to sign a number of blank *lettres de cachet* which his ministers gave away to whoever they pleased. Thus they often fell into hands of people who used them to gratify private hate; fathers obtained them and inserted the names of their sons, wives inserted the names of their husbands, opera dancers those of lovers who had spurned them. The evil grew to such a height that Turgot and Lamignon de Maloherbes refused to enter the ministry of Louis XVI. unless they might see the contents of the orders they countersigned,

and see the causes for which men were to be imprisoned. It is needless to say that when the cahiers of the primary assemblies were prepared, to instruct the deputies to the states-general in the wishes of their constituents, abolition of *lettres de cachet* was demanded in almost all the cahiers of the noblesse and tiers état. The subject was mentioned in the early debates of the Constituent Assembly, but *lettres de cachet* were not formally abolished till January 16, 1790, and on March 13 of the same year all imprisoned under them were ordered to be set at liberty. The great authority for the history and injustice of *lettres de cachet* is Mirabeau's *Enquêtes concernant Lettres de Cachet and State Prisons*, written in the dungeon at Vincennes into which his father had thrown him by a *lettre de cachet*. It is one of the ablest and most eloquent of his works, had an immense circulation, and was translated into English with a dedication to the duke of Norfolk in 1788. See also Mercier's *Tableaux de Paris* (ed. 1783), vol. vii. chap. 588, and numerous stories in Linguet's *Bastille*, and especially in the *Bastille dévoilée* (1790).

LEUCADIA. See SANTA MAURA.

LEUCIPPUS, the founder of Atomism in Greek philosophy, flourished about the middle or latter half of the 5th century B.C. Almost nothing is known of his life. His birthplace is variously given as Elea, Abdera, or Miletus. It is disputed whether he left any writings. Empedocles of Agrigento and Anaxagoras of Clazomenae were his contemporaries, while Zeno the Eleatic is said to have been his teacher. As pupil and associate he had Democritus of Abdera, beside whose greater fame his own work has been thrown into the background. Thus Epicurus would not look upon him as a philosopher at all; Lucretius ignored him; and he is barely mentioned by Lange, the modern historian of materialism. But the references of Aristotle, as well as of later authorities, leave no doubt that the leading principles of the Atomic theory are due to him. He eluded the Eleatic criticism of plurality and motion by postulating the reality of that which is not, the empty or space. Empty space and atoms are, he held, the ultimate constituents of all things. The former is infinite in magnitude; the latter are infinite in number, indivisible, and with only quantitative differences amongst one another. Nor is there any such thing as qualitative change; but all growth and decay are merely the compounding and separation of atoms. The atoms are always in activity or motion, and all things happen of necessity. Worlds, infinite in number, are produced by the atoms, variously shaped and of different weight, falling in empty space and giving rise to an eddying motion by their mutual impact. In this way worlds are being for ever produced and again destroyed. In the notices of Leucippus handed down to us there are additional traces of a cosmology, differing slightly from that of Democritus, and of a psychology which identified the soul with spherical atoms, and explained sensation and thought by a change brought about in it mechanically through the entrance of external images. The further development of the Atomic philosophy was the work of Democritus.

LEUK, or LÖCHEN LA VILLE, a village of Switzerland, at the head of a district in the canton of Valais, 15 miles by rail east of Sion, on the right bank of the Rhone. The population has increased from 1220 in 1870 to 1411 in 1880. About 5 miles to the north, in the valley of the Dala, at a height of 6462 feet above the sea, and overshadowed by the immense cliffs of the Gemmi, lie the Baths of Leuk, Leukerbad, or Leokoche-Bains, a place of only 650 permanent inhabitants, but largely frequented during

its brief summer season by French, Swiss, and Italian visitors, attracted by the hot mineral springs. These springs are twenty-two in number, and vary considerably in chemical composition and temperature. The hottest and strongest is the Lorenz spring, the water of which, registering 124° Fahr., has to be allowed to cool over night before it is used. The patients remain for hours up to their necks in the bath, talking, reading, and otherwise amusing themselves in the most sociable style. Most of the hotels are open only from June to September. The little village has several times been destroyed by avalanches (1618, 1719, 1768), and a strong embankment has been erected on the eastern side to protect it from similar catastrophes.

LEUTSCHAU (Hungarian, *Locse*; Latin, *Leutsovia*; Slovakian, *Levoča*), capital of the Cis-Tisian county of Szepes, Hungary, and until 1876 a royal free town, lies in an elevated position surrounded by mountains, and near the railway from Kassá (Kaschau) to Oderberg, about 120 miles north-east from Budapest, in 49° 1' N. lat., 20° 35' E. long. Leutschau is the seat of the county administration, and of a royal court of law, and has many fine old buildings, of which the most interesting is the church of St James, a Gothic structure of the 13th century, with richly carved altar, several monuments, and a celebrated organ erected in 1623, and long reputed the largest in Hungary. The educational establishments comprise a royal upper gymnasium (founded 1620), a state upper real school (1868), a collegiate institute for girls, and a Minorite convent. The soil of the surrounding country is generally stony and sandy, and the climate from October to April severe, but the inhabitants nevertheless succeed in raising barley, wheat, oats, flax, and a large quantity of garden produce, especially beans and peas, which are considered the best in Hungary. Other sources of occupation are mining, foresting, horse, sheep, and cattle breeding, bee-keeping, and the preparation of wax, honey, and mead, for which last the town has long been noted. The number of beehives in 1881 was seven hundred. In December 1881 the population was 6900, mostly Germans and Slovaks by nationality, and Roman Catholics and Lutherans by creed.

Founded by Saxon colonists in 1245, Leutschau had by the early part of the 16th century attained a position of great relative importance. In 1599 a conflagration laid the greater part of the town in ashes, and during the 17th century it suffered repeatedly at the hands of the Transylvanian princes and leaders. In 1846, at the time of the revolutionary war, nearly half the houses were destroyed by fire.

LEVEN, ALEXANDER LESLIE, EARL OF, one of the most distinguished soldiers of his time, was born about the close of the 16th century. He was descended from a younger son of the ancient Scottish family of Balguthain. His father was George Leslie of Balgonie, commander of the castle of Blair, and his mother was Anne, daughter of Stewart of Ballechin. At his first outset in life he acted as a volunteer in Lord Vere's regiment in Holland, fighting with the Dutch against the encroachments of Spain, where he rose to the rank of captain. He then entered the service of Gustavus Adolphus of Sweden, and became field-marshal. In 1628, when the town of Stralsund was besieged by Wallenstein, and reduced almost to the last extremity, the king of Sweden sent Leslie to take the command of the garrison, and he acted with such resolution that he obliged the count to raise the siege. For this service medals were struck in his honour. In 1630 he drove the imperialists out of the island of Rugen, and continued to serve with great distinction in the Swedish armies till the troubles in Scotland brought him home. In 1639 he was invited by the Covenanters to take the command of their army. One of his first exploits was to take the castle of Edinburgh by

surprise, without the loss of a man. He commanded the Scottish army at Dunse Law in May of that year, and in 1640 he invaded England, and defeated a party of the king's troops at Newburn, which gave him possession of Newcastle and other towns. At the treaty with the king at Ripon, Leslie was one of the commissioners of the parliament, and Charles was so well pleased with his behaviour that he created him Lord Balgonie and Earl of Leven, by patent dated 1641.

After suppressing an insurrection in Ireland in 1642, he was in 1643 appointed to the command of the Scottish army sent to assist the parliamentary party against King Charles, but after the execution of that prince he warmly espoused the cause of his son, and served as a volunteer against Cromwell at the unfortunate battle of Dunbar in 1650. Next year, however, a gathering at Aylth of Angus royalists, of whom Leslie was one, was surprised and captured by the troops of General Monk, who was then besieging Dundee. The earl with some others was sent to London and confined in the Tower, where he remained incarcerated for some time, till by the intercession of the queen of Sweden he obtained his liberty. After visiting the queen, and thanking her in person for this service, he retired to his seat at Balgonie in Fifeshire and died there at an advanced age in 1681. He is said to have been of a diminutive size, and deformed in person, but prudent, vigilant, and expert in war. He acquired considerable landed property, particularly Inchmarlin in the County of Gowrie, which he called Inchleslie. His granddaughter married George, earl of Melville; their descendant, the present representative of the title (1882), is twelfth earl of Leven and ninth earl of Melville.

LEVER, CHARLES, novelist, was born at Dublin on the 31st of August 1806 (not 1809 as usually stated), and died at Trieste on the 1st of June 1872. The accounts of the earlier part of his life are, considering the time at which he lived, singularly meagre, confused, and conflicting. His father was an architect, and he entered Trinity College, Dublin, in 1822, taking his degree in 1827. Many of the adventures of college life recorded in *Charles O'Malley* are believed to have actually happened. Later, Lever studied at Göttingen, and obtained a degree there. At some time or other before 1832 (for in this unsatisfactory way most of the facts of this part of his life are recorded) he is said to have visited America, and to have sojourned with the Indians, adopting their dress and mode of life, and going through adventures afterwards utilized in *Con Cregan* and *Arthur O'Leary*. But it is impossible to be certain as to this period; it is only towards the cholera outbreak of 1832 that something like a firm ground offers itself to the biographer. Lever had taken up the profession of medicine, and he was appointed, first to a district of which the headquarters was Killybeg in Galway, where *Harry Lorrequer* was begun, local stories being largely embodied in it, and then to a district in Ulster, around Coleraine and Newtown Limavady, where material was gathered for *Charles O'Malley* and the *Knight of Gwynne*. He married Miss Kate Baker, but even here the mist of uncertainty which envelops him exists, and it is not clear what the real date of the marriage was. After his cholera work was done he proceeded to Brussels. It has been usual to represent him as physician to the embassy, and even Thackeray (who knew him well) has given currency to the description by a quotation in the *Book of Snobs*. But it is certain that Lever was never formally appointed physician to the embassy, though he had letters of introduction to the secretary of the English legation there, and unquestionably practised. *Harry Lorrequer* was completed at Brussels, and it began to be published in 1837. It was followed by *Charles O'Malley* and *Jack Hinton*. All these stories, but

especially the first two, were made up to a great extent of experiences through which Lever had gone, or stories which he had heard in Ireland, and of the reminiscences and oddities of English residents at Brussels, where there were then many retired English officers who had gone through the Peninsular and other campaigns of the great war. It is said in particular that Major Monsoone was almost a photograph of a well-known living character at the time, and much the same thing has been asserted of other personages. This piecing together of scraps accounts for the incoherency and absence of plot in the earlier books—defects which were increased by the author's habit of composing them in fragments, and revising them for the press with the utmost carelessness. The abundance and variety of his materials, however, his skill as a *raconteur*, and the fresh and almost boisterous good humour which blew through all his work, made him very popular, and he found a congenial illustrator in H. K. Browne. After a time proposals were made to him to undertake the editorship of the *Dublin University Magazine*, which he accepted, and held the post from 1842 to 1846. During this time his income was considerable, amounting, according to his biographer, to fully three thousand a year. He lived not in Dublin but a little way out of it, and exercised boundless hospitality to visitors. Besides this, he was an inveterate card player, and not on the whole a lucky one, and he was very fond of horses, which he kept in large numbers for himself and all his family. He was indefatigable in novel writing, *Tom Burke*, *The O'Donoghue*, *The Knight of Gwynne*, &c., following those already named. But the work of editing was irksome to him, and for the reasons just named residence in Ireland made it comparatively unprofitable. He therefore resigned his editorship in the year 1846, and went abroad, where he was always more at home than in England or even in Ireland. At first he lived at Karlsruhe, where G. P. R. James was also residing; then he pitched his tent in a castle of Tyrol, which is said to be pretty accurately described in *A Day's Ride*. Afterwards he wandered about, finally settling at Florence. This neighbourhood became especially agreeable to him, uniting as it did abundant society with the possibility of enjoying it without great expense. In November 1858 he received from Lord Derby one of the rare pieces of patronage which have fallen in modern days to the share of Englishmen of letters, by being appointed consul at Spezia. During this period of wandering or settled life on the Continent, he changed his style of novel writing. His method was, as has been hinted already, always one rather of observation and reproduction than of deliberate creation, and as he had formerly drawn on the humours of Irish life, or the oddities of Wellington's veterans, so now he dealt with those of travelling Britons abroad, and with similar subjects. *The Daltons*, *The Dodd Family Abroad*, *Davenport Dunn*, &c., belong to this time and family for the most part, though some of them rather fall under the earlier class in style and date of composition. *One of Them*, *Barrington*, *The Fortunes of Glenore*, &c., led up to the most singular of all Lever's books, *A Day's Ride*, *A Life's Romance*. This book, which was published in *All the Year Round*, was said at the time—with what truth it is not easy to say—to have positively lowered the sale of that publication, yet it contains some of Lever's best work, and displays an originality not common with him. The mixture of burlesque and sentiment was, it may be supposed, either ungenial or incomprehensible to the ordinary reader.

As he grew older, Lever, whose politics had been a rather indefinite Toryism, became more of a party man, and showed this in the papers published in *Blackwood's Magazine*, under the name of "Cornelius O'Dowd," papers of a miscellaneous kind, but often political. He is said to have

thought of engaging, or to have been invited to engage, in regular journalism, but wisely declined. In 1867 he was transferred from Spezia to Trieste, a change pecuniarily advantageous, but involving the loss of the society which he passionately loved. The last years of Lever's life were somewhat clouded. His health had never been good, and he had not lived carefully. His wife, to whom he was much attached, died before him. But he was still active with his pen, and the novels of his last period, if less lively than his earlier ones, are far better written as well as far more regular and careful in construction. Such are *Sir Brooks Footbrooke*, *That Boy of Norcott's*, *Sir Jasper Carew*, *The Brambleighs of Bishop's Folly*, and his last book, *Lord Kilgobbin*. He died, as has been said, in the summer of 1872. Novels not yet mentioned are *Roland Cushe*, *Luttrell of Arran*, *Tony Butler*, *Maurice Tierney*, *the Martins of Cro' Martin*, *St Patrick's Eve*, &c.

Lever deserves an honorable place among the secondary novelists of the 19th century, but it is not very probable that any single novel of his will have a long lease of popularity. He is one of the authors who do not take the trouble to learn the mechanism of their art until the heyday of their imaginative force is past. The defects of his earlier works have been already indicated. They are written with almost unconceivable carelessness, the same incidents occurring over and over again, and the chronology being altogether bewildering. This is especially the case with *Charles O'Malley*, which, however, owing to the liveliness of its adventures and the personage of Mickey Free the Irish servant, is still perhaps the most popular of all. With young and uncritical readers this popularity is likely to be maintained until some supplanter in the same kind arises, or until the state of manners and society becomes too obsolete for anything more than historical interest. Then Lever, like all writers whose formal excellence is not sufficient to save them, will be forgotten, for he late work, though almost always amusing and sometimes more, has little abiding interest. The authority for Lever's biography is the *Life* by Dr. W. J. Fitzgerald (London, 1879). (G. S. A.)

LEVERRIER, URBAIN JEAN JOSEPH (1811–1877), one of the greatest astronomers of modern times, was born at St Lô in Normandy, March 11, 1811. His father, who held a small post under Government, made great efforts to send him to Paris, where a brilliant examination gained him, in 1831, admittance to the École Polytechnique. The distinction of his career there was rewarded with a free choice amongst the departments of the public service open to pupils of the school. He selected the administration of tobacco, addressing himself especially to chemical researches under the guidance of Gay-Lussac, and gave striking proof of ability in two papers on the combinations of phosphorus with hydrogen and oxygen, published in *Annales de Chimie et de Physique* (1835 and 1837). His astronomical vocation, like that of Kepler, came from without. The place of teacher of that science at the École Polytechnique falling vacant in 1837, it was offered to and accepted by Leverrier, who, "docile to circumstance," instantly abandoned chemistry, and directed the whole of his powers to celestial mechanics. The first fruits of his arduous labours were contained in two memoirs presented to the Academy, September 16 and October 14, 1839. Pursuing the investigations of Laplace, he demonstrated with greater rigour the stability of the solar system, and calculated the limits within which the eccentricities and inclinations of the planetary orbits vary. This remarkable debut excited much attention, and, on the recommendation of Arago, he took in hand the theory of Mercury, producing, in 1843, tables of that planet far superior in accuracy to those hitherto available. The perturbations of the comets discovered, the one by Faye in November 1843, the other by De Vico a year later, were minutely investigated by Leverrier, with the result of disproving the supposed identity of the first with Lexell's lost comet of 1770, and of the other with Tycho's of 1586. On the other hand, he made it appear all but certain that Vico's comet was the same with one seen by Lahire in 1678.

He was once more, by the summons of Arago, recalled to planetary studies, and this time it was to Uranus that his attention was directed. Step by step, with sagacious and patient accuracy, he advanced to the great discovery which has immortalized his name. Carefully sifting all the known causes of disturbance, he showed that one hitherto unknown must be added to their number, and on the 23d of September 1846 the planet Neptune was discerned by Galle at Berlin, within one degree of the spot indicated by Leverrier. See *ASTRONOMY*, p. 813.

This memorable achievement was greeted with an outburst of public enthusiasm, and requited with a shower of public distinctions. Academies vied with each other in enrolling Leverrier among their members; the Royal Society awarded him the Copley medal; the king of Denmark sent him the order of the Dannebrog; he was named officer in the Legion of Honour, and preceptor to the Comte de Paris; a chair of astronomy was created for his benefit at the Faculty of Sciences, he was appointed adjunct astronomer to the Bureau of Longitudes. Returned to the Legislative Assembly in 1849 by his native department of Manche, he voted with the anti-republican party, but devoted his principal attention to subjects connected with science and education. After the *coup d'état* he became a senator and inspector-general of superior instruction, sat upon the commission for the reform of the Ecole Polytechnique (1854), and, on January 30, 1854, succeeded Arago as director of the Paris observatory. His official work in the latter capacity would alone have strained the energies of an ordinary man. The institution had fallen into a state of lamentable inefficiency. Leverrier placed it on a totally new footing, freed it from the control of the Bureau of Longitudes, and raised it to its due rank among the observatories of Europe. He did not, however, escape the common lot of reformers. His uncompromising measures and unconciliatory manner of enforcing them raised a storm only appeased by his removal, February 5, 1870. Three years later, on the death of his successor Delaunay, he was reinstated by M. Thiers, but with authority restricted by the supervision of a council. In the midst of these disquietudes, he executed with unflinching resolution a task the gigantic proportions of which cannot be contemplated without amazement. This was nothing less than the complete revision of the planetary theories, together with a laborious comparison of results with the most authentic observations, and the construction of tables representing the movements thus corrected. It required all his indomitable perseverance to carry through to the end a purpose which failing health continually menaced with frustration. He had, however, the happiness of living long enough to perfect his work. Three weeks after he had affixed his signature to the printed sheets of the theory of Neptune he died at Paris, in his sixty-seventh year, September 23, 1877. By his marriage with Mademoiselle Choquet, who survived him little more than a month, he left a son and daughter.

The discovery with which the memory of this great man is popularly identified was only an incident in his career. The elaboration of the scheme of the heavens traced out by Laplace in the *Mécanique Céleste* was his larger aim, for the accomplishment of which forty years of unremitting industry barely sufficed. The work once done, however, may almost be said to have been done for all time, from the extraordinary care with which errors were guarded against, and imperfections in the data allowed for. The organization of the meteorological service in France is entirely due to Leverrier, and the present system of international weather-warnings is the realization of a design which he warmly promoted. He founded the Association Scientifique, and was active in introducing a practical scientific element into public education. His inference of the existence, between Mercury and the sun, of an appreciable quantity of circulating matter (*Comptes Rendus*, 1869, i. p. 379), though unquestionably sound, has not yet been satisfactorily verified by observation. He was twice, in 1868 and 1876, the recipient of the gold medal

of the Royal Astronomical Society, London, and the university of Cambridge conferred upon him, in 1875, the honorary degree of LL.D. All his planetary tables have been adopted by the *Nautical Almanac*, as well as by the *Connaissance des Temps*.

The *Annales de l'Observatoire de Paris*, the publication of which was set on foot by Leverrier, contain, in vols. i.-vi. (*Mémoires*), 1848-51, and x.-xiv., 1874-77, his theories and tables of the several planets. In vol. i. will be found, besides his masterly report on the observatory, a general theory of secular inequalities, in which the development of the disturbing function is carried to a point hitherto unattempted. The memoirs and papers communicated by him to the Academy have been summarized in *Comptes Rendus*, 1869-76, and the more important published in full either separately, or in the *Conna. des Temps* and the *Journal des Mathématiques*. That entitled *Développemens sur différents points de la Théorie des perturbations*, 1841, has been translated in part xvii. of Taylor's *Scientific Memoirs*. For his scientific work see Professor Adams's address, *Monthly Notices*, vol. xxvii. p. 222, and M. Tisserand's review in *Ann. de l'Obs.*, tom. xv., 1869, for a notice of his life, M. Bertrand's "*Résumé Historique*," *Mém. de l'Acad. des Sciences*, tom. xli, 2^{me} série. (A. M. C.)

LEVIS, formerly POINTÉ LEVI or POINT LEVIS, the chief town of a county of the same name in Canada, on the other side of the St. Lawrence from Quebec, with which it communicates by a ferry. In the beginning of the present century Pointe Lévi was a cluster of white houses, with a church and a number of large mills, it has now become an important station on the Grand Trunk Railway, and in the extent of its river trade is surpassed by only a few places in the Dominion. In 1881 the population was 7597.

LEVITES (לְוִיִּם), or sons of Levi (לֵוִי), are defined according to the usual methods of Hebrew genealogical history as the descendants of Levi, the third son of Jacob by Leah (Gen. xxix. 34).¹ But in Hebrew genealogies we are not necessarily entitled to look upon the eponymus of a tribe as more than an ideal personality, and, without entering into the large question how far the patriarchal history may be held to furnish exceptions to this rule, it may be observed that the only narrative in which, on a literal interpretation, Levi appears as a person (Gen. xxiv.) bears internal evidence of the intention of the author to delineate under the form of personification events in the history of the tribes of Levi and Simeon which must have taken place after the sojourn of Israel in Egypt.² The same events are alluded to in Gen. xlii. 5-7, where Simeon and Levi are plainly spoken of as communities with a communal assembly (קָהָל). They were allied tribes or brothers; their onslaught on the Shechemites was condemned by the rest of Israel; it took place before the Hebrews had passed from pastoral to settled life (ver. 5, "instruments of violence are their shepherds' staves"); and its results were disastrous to the actors, when their cause was disavowed by their brethren. The Benê Hamor regained possession of Shechem, as we know from Judges ix., and both the assailing tribes were scattered through Israel, and failed to secure an independent territorial position. The details of this curious portion of the earliest Hebrew history must remain obscure; the narrative in Gen. xxiv. does not really place them in so clear a light as the briefer reference in Gen. xlii.; for the former chapter has been retold and largely added to by a late writer, who looks upon the action of the brethren in the light of the priestly legislation, and judges it much more favourably than is done in Gen. xlii. In post-canonical Judaism the favourable view of the zeal of Levi and Simeon becomes still more dominant (Judith ix. 2 sq.; *B. Sotâ*, chap. xxx;

¹ In Gen. xxix. 34 the name of Levi is connected with לֵוִי, "attach oneself to." This form, however, is that of a gentile noun, and it is most probably a "reduplication" from Leah, as suggested by Wellhausen. See also Stade in *St. f. A. Theol. Wissenschaft.*, i. 116.

² Jacob in verse 30 is not a personal but a collective idea, for he says, "I am a few men;" and the capture and total destruction of a considerable city is in the nature of things the work of two tribes rather than of two individuals.

and especially Theodotus, *ap. Polyhistor*, in *Müller's Fragmenta*, iii. 217 sq., and the curse of Jacob on the ferocity of his sons is quite forgotten.¹ In the oldest history, however, the treachery of Levi and Simeon towards a community which had received the right of *consuetudo* with Israel is represented as a crime, which imperilled the position of the Hebrews and was fatal to the future of the tribes directly involved.

But while the Levites were scattered throughout Israel their name does not disappear from the roll of the tribes. In the Blessing of Moses (Deut. xxxiii.), where Simeon is passed over, Levi still appears, not as a territorial tribe but as the collective name for the priesthood. The priesthood meant is that of the northern kingdom under the dynasty of Jehu, to which the chapter in question belongs; and in fact we know that the priests of the important northern sanctuary of Dan traced their origin to a Levite (Jud. xiv. 9), Jonathan the son of Gershom, the son of Moses (Jud. xvii. 30).² That the Judean priesthood were also known as Levites in the later times of the kingdom appears from the book of Deuteronomy, especially from x. 8 sq., xvii. 1 sq.; and we learn from Ezek. xiv. 10 sq. that the Judean Levites were not confined to the service of the temple, but included the priests of the local high places abolished by Josiah. Alike in Judah and in the north the priestly prerogative of Levi was traced back to the days of Moses (Deut. x. 8, xxxiii. 8); but in later times at least the Judean priesthood did not acknowledge the Levitical status of their northern colleagues (1 Kings xii. 31). It must, however, be observed that the prophets Amos and Hosea never speak of the northern priesthood as illegitimate, and Hosea iv. certainly implies the opposite. Presumably it was only after the fall of Samaria, and the introduction of large foreign elements into the population of the north, that the southern priests began to disavow the ministers of the sanctuaries of Samaria, most of whom can no longer have been representatives of the old priesthood as it existed before the northern captivity (2 Kings xvii. 28, comp. Amos vii. 17, Jud. xvii. 30, 2 Kings xxiii. 20, in contrast with verses 8 sq.).

In the most developed form of the hierarchical system the ministers of the sanctuary are divided into two grades. All are regarded as Levites by descent, but the mass of the Levites are mere subordinate ministers not entitled to approach the altar or perform any strictly priestly function, and the true priesthood is confined to the descendants of Aaron. In the documents which reveal to us the actual state of the priesthood in the northern and southern kingdoms before the exile, there is no trace of this distinction. Every Levite is a priest, or at least is qualified to become such (Deut. x. 8, xvii. 7). The subordinate and menial offices of the tabernacle are not assigned to members of a holy guild, in Jerusalem at least they were mainly discharged by members of the royal body-guard (the Carians and footmen, 2 Kings xi. 4, *Heb.*), or by bond slaves, the ancestors of the later Nethinim,—in either case by men who might even be uncircumcised foreigners (Ezek. xiv. 7 sq.). A Levitical priest was a legitimate priest; when the author of 1 Kings xii. 31 wishes to represent Jeroboam's priests as illegal he contents himself with saying that they were not taken from the sons of Levi. The first

historical trace of a modification of this state of things is found in connexion with the suppression of the local high places by Josiah, when their priests were brought to Jerusalem and received their support from the temple offerings, but were not permitted to minister at the altar (2 Kings xxiii. 9). The priests of the temple, the sons of Zadok, were not prepared to concede to their provincial brethren all the privileges which Deut. xvii. had proposed in compensation for the loss of their local ministry. Ezekiel, after the fall of the temple, in planning a scheme of ritual for the new temple, raises this practical exclusion from the altar to the rank of a principle. In the new temple the Levites who had ministered before the local altars shall be punished by exclusion from proper priestly work, and shall fill the subordinate offices of the sanctuary in place of the foreigners who had hitherto occupied them, but shall not be permitted to pollute Jehovah's house in future by their presence (Ezek. xiv. 7 sq.). After the exile this principle was actually carried out, priests and Levites are distinguished in the list of the Jews who returned under the decree of Cyrus (Ezra ii.; Neh. vii.); but the former, that is, the descendants of the pre-exilic priests of the royal temple, greatly outnumber the Levites or descendants of the priests of the high places. At this time other classes of temple servants, the singers, the porters, the Nethinim or slaves of the sanctuary, and the children of Solomon's slaves, whose hereditary service would, on Eastern principles, give them a pre-eminence over other slaves of the sanctuary, are also still distinguished from the Levites; but these distinctions lost their significance when the word Levite itself came to mean a subordinate minister. In the time of Nehemiah, Levites and singers, Levites and porters, are very much run into one (Neh. xi. xii, xiii.), and ultimately the absorption of the other classes of subordinate ministers into the hereditary guild of Levites is formally expressed in the shape of genealogies, deriving the singers, and even families whose heathenish and foreign names show them to have originally belonged to the Nethinim, from the ancient stock of Levi.³

The new hierarchical system found its legal basis in the Pentateuch, or rather in the so-called priestly legislation, first publicly accepted as an integral part of the Torah under Ezra and Nehemiah. Here the exclusion of the Levites from all share in the proper priesthood of the sons of Aaron is precisely formulated (Num. iii. sq.); their service is regulated from the point of view that they are essentially the servants and hereditary serfs of the priests (iii. 9), while, on the other hand, they are recognized as possessing a higher grade of holiness than the mass of the people, and are endowed with the tithes, of which in turn they pay a tithe to the priests (Num. xviii. 21 sq.). These regulations as to tithes were enforced by Nehemiah; but the subordinate position of the Levites was hardly consistent with their permanent enjoyment of revenues of such importance, and we learn from the Talmud that they were finally transferred to the priests.⁴ Another provision of the law, viz., the assignment to the Levites of certain cities with a definite measure of inalienable pasture ground (Num. xxxv.; Lev. xxv. 34), was apparently never put in force after the exile.

As the priestly legislation carried its ordinances back into the time of Moses (see PENTATEUCH), so the later developments of the Levitical service as they existed in the time of the Chronicler about the close of the 4th century

¹ According to Wellhausen's analysis (*Jahrb. f. D. Theol.*, xxi. 485 sq.), the old narrative consisted of Gen. xxiv. 8, 7*, 11, 12, 19, 28*, 29*, 30, 31, the scribe denoting that only parts of the verses marked by * are ancient. The latest and most satisfactory discussion is that of Kuenen (*Theol. Tijdschr.*, xiv. 287 sq.), in which the opposite view of Dillmann (*Genesis*, ad i.) is fully refuted.

² It is generally agreed that Moses (מֹשֶׁה) is the true reading. The later Jews corrected the name to חֲנָנִיאל by inserting the letter ח, but did not venture to do so except above the line (מֹשֶׁה־חֲנָנִיאל), so that the reading of the archetype can still be restored.

³ See the details, and the proof that the later Levites included men whose actual ancestry belonged to other tribes, in Ewald's *Geschichte*, ii. 230; Wellhausen, *Geschichte*, i. 152, 228; Graf in *Morx's Archiv*, i. 231.

⁴ See Mielke, *Massek Sheni*, chap. v. and, the *Jerusalem Gemara* (ii. 259 of Schwartz's translation); *Yebamoth*, f. 88a; *Caracur*, *App. ad Godes*, p. 224; and Hottinger, *De Doct.*, vi. 8, ix. 17.

to be referred by that author to David (1 Chron. xv, xvi, xxiii) or to Hazeleiah (2 Chron. xxix.) and Josiah (2 Chron. xxxv.). The chief point is the development of the musical service of the temple, which has no place in the Pentateuch, but afterwards came to be of the first importance, as we see from the Psalter, and attracted the special attention of Greek observers (Theophrastus, *ap* Porph., *De Abst.*, ii, 26).

While it is not difficult to trace the history of the Levites from the time of the Blessing of Moses and Aaron downwards, the links connecting the priestly tribe with the earlier fortunes of the tribe of Levi are hardly to be determined with any certainty.

According to the traditional view the scheme of the Levitical legislation, with its double hierarchy of priests and Levites, is of Mosiac ordinance. But there are many proofs that in the Pentateuch, as we possess it, divergent ordinances, dating from very different ages, and all carried back by means of a legal convention to the time of the wilderness journey. And, if the complete hierarchical theory as it existed after the exile was really the work of Moses, it is inexplicable that all trace of it was so completely lost in the time of the monarchy, that Ezekiel speaks of the degradation of the non-Zadokites Levites as a new thing and as a punishment for their share in the sin of the high places, and that no clear evidence of the existence of a distinction between priests and Levites has been found in any Hebrew writing demonstrably earlier than the exile.¹ It is indeed argued that the narrative of the rebellion of Korah, and the list of Levitical cities in Josh. xxi., imply that the precepts of the post-exile law were practically recognized by Moses and Joshua, but it is certain that the distribution spoken of in Josh. xxi. did not take place at the time of the conquest, because many of the cities named were either not conquered by the Hebrews till long afterwards, or, if conquered, were not held by Levites. The Levitical cities of Joshua are indeed largely identical with ancient holy cities (Hebron, Shechem, Mahanaim, &c.); but in ancient Israel a holy city was one which possessed a noted sanctuary (often of Canaanite origin), not one the inhabitants of which belonged to the holy tribe. These sanctuaries had of course their local priesthoods, which in this time of the monarchy were all called Levitical; and it is only in this sense, not in that of the priestly legislation, that a town like Shechem can ever have been Levitical. So again the narrative of Korah's rebellion cannot be taken as evidence of composite origin; the parts of it which represent Korah as a common Levite in rebellion against the priesthood of Aaron belong to a late date, and the original form of the history knows nothing of the later hierarchical system.²

We are thus compelled to give up the idea of carrying back the distinction of Levites and Aaronites in the later sense to the time of Moses, and are excluded from using the priestly parts of the Pentateuch and Joshua as a source for the earliest history of the tribe. It still, however, remains certain that under the monarchy the priestly consecration of Levi was referred to the time of Moses, who was himself a member of the tribe, and in Deut. x. 8 the functions of Levi are specially connected with the Mosiac sanctuary of the ark. Now we know from 1 Sam. ii. 27, that the priests of the ark in the period of the Judges claimed descent from the family of Moses; and the case of Micah's Levite shows that a descendant of Moses was regarded as a peculiarly fit priest. The whole evidence conspires to show that from the time of Moses downwards his kin had a certain hereditary prerogative in connexion with the worship of Jehovah. In the earliest times the ritual of Jehovah's sanctuary had not attained such development as to occupy a whole tribe, but it, as appears probable, the mass of the tribe of Levi was almost annihilated in the first age after Moses, the name of Levi might very well continue to be known only in connexion with those of the tribe who traced kin with Moses or remained by the sanctuary. The multiplication of Hebrew holy places was effected partly with the consent with the Canaanites, partly in other ways that had nothing to do with the Mosiac sanctuary, and so a variety of priestly guilds arose which certainly cannot have been all of Levitical descent. But, as the nation was consolidated and a uniform system of sacred law, referred to Moses as its originator, came to be administered all over the land, in the hands of the ministers of the greater sanctuaries, the various guilds must

have been drawn together and have aimed at forming such a united body as we find described in Deut. xxxiii. and this unity would find a natural expression in the extension of the name of Levites to all priesthoods recognized by the state. If this was the course of things we can hardly suppose that the term came into large use till the Israelites were consolidated under the monarchy, and in fact the integrity of the text in 1 Sam. vi. 15, 2 Sam. vi. 24, as well as 1 Kings viii. 4, is open to question. Up to the time of David and Solomon, as appears from the cases of Samuel, Zadok, Eleazar (1 Sam. vii. 1), and the sons of David (2 Sam. viii. 18), as well as from 1 Kings xii. 31, the priesthood was not essentially hereditary, but, like any occupations that required traditional knowledge, it must have tended to become more and more so, and all priests would appear as Levites by adoption if not by descent. Wellhausen (*Gench.*, i, 139) has argued from Deut. xxxiii. 9 that the northern priesthood was not an hereditary guild, but involved the surrender of all family connection; the words, however, as more naturally understood as praise of the judicial impartiality which refused to be influenced by family ties. Our data are too scanty to clear up the details of this interesting piece of history; but it can hardly be doubted that the development of a consolidated and hereditary priestly corporation in all the sanctuaries was slowly bound up with the unification of the state and the absorption of tribal organization in the monarchy. The reaction of tribal feeling against the central government, of which there are many traces in the history of Ephraim, has perhaps its counterpart in the opposition to the united priesthood which is alluded to in Deut. xxxiii. 11.

There have been many attempts on the part of recent writers from the time of Yetsé downwards to deny that Levi was one of the original tribes of Israel, but they all break down before the testimony of Gen. xlix. See especially Kuenen's refutation of the theory of Land, *Theol. Tijdsch.*, 1872, p. 628 sq., and for the latest and best summary of the case see in *Monist.*, vol. i, 4 (1895), "Zur Geschichte des Stammes Levi," Wellhausen, *Gench.*, i, p. 123 sq., Stadel, *Gench. d. V. Israel*, p. 152 sq. (W. R. S.).

LEVITICUS SEE PENTATEUCH

LEW-CHEW ISLANDS. The Lew-chew, Loocooch, Liu Kiu, or Riu Kiu Islands³ include, in the wider application of the name, the whole series extending in a north-east and south-west direction from the southern end of Kinshiu in Japan proper to the north-east of Formosa. Within the northern group lies the intersection of 130° E. long. and 30° N. lat.; and in the southern group that of 126° E. long. and 25° N. lat. The islands, however, to the north of 25° are not unfrequently considered, by Europeans as well as Japanese, to belong in part to Japan proper, and in part to constitute the separate group of the Lincshotens, Shichi-to, or Oedile Archipelago.

The following, according to Doederlein, are the recognized subdivisions and areas of the whole archipelago:—(1) *The Northern Islands* (attached to Satsuma or Kinshiu Osumi, 899 square miles); Tanaga (159 square miles), Iliaka, Yakuno (172 square miles), Take, Yau or Iwaga, Kura, Kose or Kowose, and Kudono-Eabu or Nagrobo; (2) *Shachi-to* (43 square miles) Kuchino, Gaza or Yabi, Naka-no (the largest, 13 square miles), Hiru or Fira, Suwase, Akuseki, Takara, and Yoko; (3) *Hakuba-Shoto* (515 square miles). Oshima (303 square miles), Kagurama or Katana (40 square miles), Yori, Utsu or Uru, Kital, Yokuno or Kahuruma (99 square miles), Naka Erabu, and Yoru or Yori; (4) *Chubu-Shoto* (562 square miles); Tori or Iwo, Kheya or Toboya, Isoma, Iye, Awakuni or Aguneh, Tonashu, Kume, Kewama or Amakurima, and Okinawa (520 square miles); (5) *Nambu-Shoto* or the Maakoshima Group (816 square miles). Miyako or Ty-pu-san (67 square miles), Misuna and Taruma, Ishigaki or Pa-chung-mu (47 square miles), Ihekoma or Robertson Island, Ohama or Kubah, Kuo or Bauga, Iriomoto Nahikotom or Koo-Kien-San, Azagaku or Chung-chi, Misutsuma or Hasyolan, Yonakuni or Kumi.

The area of the Lew-chews proper is thus 1425 square miles, that of the whole chain 1864 square miles. The largest islands are Okinawa (often called Great Lew-chew) and Oshima, the former being also the political centre of the whole archipelago. The Lew-chews consist in the main of crystalline rocks—gneiss, hornblende, and granite—upheaved at a very remote date, and only partially covered by severely weathered sedimentary strata seldom left in their original horizontal position. Coralline limestone is found in great abundance even on the tops of the hills, and the coasts are often fringed by coral reefs. In

¹ The recent defence of the traditional view by S. I. Courtes (*The Levitical Priest*, 1877) still assumes such evidence in 1 Kings viii. 4. But there are many evidences that the text of this part of Kings has undergone considerable editing at a pretty late date. The LXX. translators did not read the clause which speaks of "priests and Levites," and the Chremistore read "the Levite priests,"—the phrase characteristic of the Deuteronomic identification of priestly and Levitical ministry.

² See the latest researches of Kuenen, *Theol. Tijdsch.*, xii, 189 sq., where other recent discussions of the chapter are cited and examined.

³ See a curious history of the name in Li Ting Yuen's Journal.

erected in the 15th century; St John's, Southover, is of mixed architecture, but preserves some specimens of Early Norman. There are only slight remains of the old castle, occupying a picturesque situation on the height, and supposed to have been founded by Alfred and rebuilt by William de Warren. In the grounds of the old Cluniac priory of St Pancras, founded in 1078, the leaden coffins of William de Warren and Guadrada were dug up during an excavation in 1845. There is a free grammar school dating from 1512, and among the other public buildings are the county-hall, the prison, and the Fitzroy memorial library. The industries include the manufacture of agricultural implements, brewing, tanning, and iron and brass founding. The population of the urban sanitary district in 1871 was 6010, and in 1881 it was 6017, the population of the parliamentary borough (area 1087 acres) in the same years being 10,753 and 11,199. Lewes was incorporated by royal charter in 1881.

From various discoveries that have been made of Roman coins, and the traces that still remain of old mounds and tumuli, the town is believed to be of very ancient origin. It was a royal demesne of the South Saxon kings. Mints were established at it by Athelstan, which were in operation till the reign of Harold At the battle of Lewes, May 13, 1264, Simon de Montfort defeated Henry III. From the time of Edward I until 1868 the town returned two members to parliament, but now it returns only one. See, besides the histories of Sussex, Horsfield, *History of Lewes*, 2 vols., 1834-27, and several interesting papers in the *Sussex Archaeological Collection*.

LEWES, GEORGE HENRY (1817-1878), a prolific and versatile writer, born in London in 1817, was a grandson of Charles Lee Lewes, a comedian who had a considerable reputation in his day. He was educated in London, Jersey, and Brittany, and began active life by attempting business and afterwards medicine. Later he appears to have had serious thoughts of making the stage his profession. He finally fixed his choice on a literary career. His early writings belong mainly to the lighter departments of letters. He contributed a large number of critical studies to the leading quarterly and other reviews. These discuss a wide variety of subject, and, though often characterized by hasty impulse and imperfect study, betray a singularly acute critical judgment, which has been enlightened by philosophic study. Of these critical writings the most valuable are those on the drama, which were afterwards republished under the title *Actors and Acting* (1875). With this may be taken the volume on *The Spanish Drama* (1846). The combination of wide scholarship, philosophic culture, and practical acquaintance with the theatre gives these essays a high place among the best efforts in English dramatic criticism. In 1846-1848 he published *The Biographical History of Philosophy*, an attempt to depict the life of philosophers as an ever-renewed fruitless labour to attain the unattainable. In 1847-1848 he made two attempts in the field of fiction—*Ranish ope*, and *Rosé, Blanche, and Violet*—which, though displaying considerable skill both in plot, construction, and in characterization, have taken no permanent place in literature. The same is to be said of an ingenious attempt to rehabilitate Robespierre (1849). The culmination of the author's work in prose literature is the *Life of Goethe* (1855), probably the best known of his writings. Lewes's many-sidedness of mind, and his combination of scientific with literary tastes, eminently fitted him to appreciate the large nature and the wide-ranging activity of the German poet. The high position this work has taken in Germany itself, notwithstanding the boldness of its criticism and the unpopularity of some of its views (e.g., on the relation of the second to the first part of *Faust*), is a sufficient testimony to its general excellence. From about 1853 Lewes's writings show that he was occupying himself with scientific and more particularly biological work. He may be said

to have always manifested a distinctly scientific bent in his writings, and his closer devotion to science was but the following out of early impulses. Considering the author's want of the usual course of technical training, these studies are a remarkable testimony to the penetration of his intellect. The most important of these essays are collected in the volumes *Science Studies* (1858), *Physiology of Common Life* (1859), *Studies in Animal Life* (1862), and *Aristotle, a Chapter from the History of Science* (1864). They are much more than popular expositions of accepted scientific truths. They contain able criticisms of authorized ideas, and embody the results of individual research and individual reflexion. He struck out a number of impressive suggestions, some of which have since been accepted by physiologists at home and abroad. Of these the most valuable is that now known as the doctrine of the functional indifference of the nerves—that what are known as the specific energies of the optic, auditory, and other nerves are simply differences in their mode of action due to the differences of the peripheral structures or sense-organs with which they are connected. This idea has since been independently arrived at by Wundt (*Philosophische Psychologie*, 2d ed., p. 321). In 1865, on the starting of the *Fortnightly Review*, Lewes became its editor, but he retained the post for less than two years. This date marks the transition from more strictly scientific to philosophic work. He had from early youth cherished a strong liking for philosophic studies, one of his earliest essays was an appreciative account of Hegel's *Æsthetics*. Coming under the influence of positivism as unfolded both in Comte's own works and in J. S. Mill's *System of Logic*, he abandoned all faith in the possibility of metaphysics, and recorded this abandonment in the above-mentioned *History of Philosophy*. Yet he did not at any time give an unqualified adhesion to Comte's teaching, and with wider reading and reflexion his mind moved away further from the positivist's standpoint. In the preface to the third edition of his *History of Philosophy* he avowed a change in this direction, and this movement is still more plainly discernible in subsequent editions of the work. The final outcome of this intellectual progress is given to us in *The Problems of Life and Mind*, which may be regarded as the crowning work of his life. His sudden death in 1878 cut short the work, yet it is complete enough to allow us to judge of the author's matured conceptions on biological, psychological, and metaphysical problems.

The first two volumes on *The Foundations of a Creed* lay down what he regarded as the true principles of philosophizing. He here seeks to effect a rapprochement between metaphysics and science. He is still so far a positivist as to pronounce all inquiry into the ultimate nature of things fruitless. What matter, form, spirit are in themselves is a futile question that belongs to the stultic region of "metaphysics." But philosophic questions may be so stated as to be susceptible of a precise solution by scientific method. Thus, since the relation of subject to object falls within our experience, it is a proper matter for philosophic investigation. It may be questioned whether Lewes is right in thus identifying the methods of science and philosophy. Philosophy is not a mere extension of scientific knowledge; it is an investigation of the nature and validity of the knowing process itself. In any case Lewes cannot be said to have done much to aid in the settlement of properly philosophical questions. His whole treatment of the question of the relation of subject to object is vitiated by a confusion between the scientific truth that mind and body coexist in the living organism and the philosophic truth that all knowledge of objects implies a knowing subject. In other words, to use Mr. Shadworth Hodgson's phrase, he mixes up the question of the *genesis* of mental forms with the question of their *nature* (see *Philosophy of Reflection*, vol. II, pp. 40-48). Thus he reaches the "monistic" doctrine that mind and matter are two aspects of the same existence by attending simply to the parallelism between psychical and physical processes given as a fact (or a probable fact) of our experience, and by leaving out of account their relation as subject and object in the cognitive act. His identification of the two as phases of one existence is open to criticism, not only from the point of view of

philosophy, but from that of science. In his treatment of such ideas as "sensibility," "sentience," and the like, he does not always show whether he is speaking of physical or of psychical phenomena. Among the other properly philosophic questions discussed in these two volumes the nature of the causal relation is perhaps the one which is handled with most freshness and suggestiveness. The third volume, *The Physical Basis of Mind*, further develops the writer's views on organic activities as a whole. He insists strongly on the radical distinction between organic and inorganic processes, and on the impossibility of ever explaining the former by purely mechanical principles. With respect to the nervous system, he holds that all its parts have one and the same elementary property, namely, sensibility. This sensibility belongs as much to the lower centres of the spinal cord as to the brain, contributing in this more elementary form elements to the "subconscious" region of mental life. The higher functions of the nervous system, which make up our conscious mental life, are merely more complex modifications of this fundamental property of nerve substance. Closely related to this doctrine is the view that the nervous organism acts as a whole, that particular mental operations cannot be referred to definitely circumscribed regions of the brain, and that the hypotheses of nervous activity passing in the centre by an isolated pathway from one nerve-cell to another is altogether illusory. By insisting on the complete coincidence between the regions of nerve-action and sentence, and by holding that these are but different aspects of one thing, he is able to attack the doctrine of animal and human automatism, which affirms that feeling or consciousness is merely an incidental concomitant of nerve-action, and in no way essential to the chain of physical events. Lewis's views in psychology, partly opened up in the earlier volumes of the *Problems*, are more fully worked out in the last two volumes (2d series). He discusses the method of psychology with much insight. He claims against Comte and his followers a place for introspection in psychological research. In addition to this subjective method there must be an objective, which consists partly in a reference to nervous conditions, and partly in the employment of sociological and historical data. Biological knowledge, or a consideration of the organic conditions, would only help us to explain mental functions, as feeling, as feeling is, it would assist us to understand the stand differences of mental faculties as manifested in different races and stages of human development. The organic conditions of these differences will probably for ever escape detection. Hence they can be explained only as the products of the social environment. The idea of dealing with mental activity in their relation to social and historical conditions is probably Lewis's most important contribution to psychology. Among other points which he emphasizes is the complexity of mental phenomena. Every mental state is regarded as compounded of three factors in different proportions—namely, a process of sensible affection, of logical grouping, and of motor impulse. But Lewis's work in psychology consists less in any definite discoveries than in the inculcation of a sound and just method. His biological training prepared him to view mind as a complex unity, in which the various functions interact one on the other, and of which the highest processes are identical with and evolved out of the lower. Thus the operations of thought, or "the logic of signs," are merely a more complicated form of the elementary operations of sensation and instinct, or "the logic of feeling." The whole of the last volume of the *Problems* may be said to be an illustration of this position. It is a valuable repository of psychological facts, many of them drawn from the more obscure regions of mental life and from abnormal experience, and is throughout suggestive and stimulating. To suggest, and to stimulate the mind, rather than to supply it with any complete system of knowledge, may be said to be Lewis's service in philosophy. The exceptional rapidity and variety of his intelligence seems to account at once for the freshness in his way of envisaging the subject-matter of philosophy and psychology, and for the want of satisfactory elaboration and of systematic co-ordination. (J S)

LEWIS AND HARRIS form together an island of the Outer Hebrides, nearly separated into two parts by the inlets of Loch Rosort and Seaforth,—the northern part, Lewis or the Lewa, being in Ross-shire, and the southern part, Harris, in Inverness. The island is situated about 30 miles from the mainland, between 57° 40' and 58° 39' N. lat., and 6° and 7° W. long. Its length is 60 miles, the average breadth 15, and the extreme breadth 30. The area is 770 square miles, of which 575 are comprised in Lewis. The greater part of the surface is composed of gneiss rocks, which in Ben More attain a height of 1750 feet, but there is also a large breadth of peat and swamp, with remains of an ancient forest. The coast is much indented by bays. The climate is very moist and unsuitable for tillage. Agriculture is in a backward condi-

tion, but much has been done in draining, reclamation, and planting of trees by the late proprietor of Lewis, Sir James Matheson. Barley and potatoes are the principal crops, and a large number of black cattle are reared. Kelp making is also carried on, but one of the chief supports of the inhabitants is fishing, Stornoway being the largest station for the herring fishery in Scotland, and employing over 1000 boats with nearly 4000 men and boys. The town was made a burgh of barony by James VI. It has a commodious harbour with a patent ship suitable for vessels of 1000 tons. On a height overlooking the bay is the beautiful residence of the proprietor of the island. The most remarkable archaeological remains in Lewis are the druidical stones of the temple of Callernish. There are also a large number of old obelisks, and at Meallista in Uig the remains of an old monastery. Six miles from Stornoway there is a huge cave covered with stalactites. See HERRIES.

LEWIS, SIR GEORGE CORNEWALL, BART. (1806-1863), statesman and man of letters, was born in London on 21st April 1806. His father, Thomas F. Lewis of Harpton Court, Radnorshire, after holding subordinate offices in various administrations became a poor-law commissioner. He was made a baronet in 1846. Lewis was educated at Eton, and at Christ Church, Oxford, where in 1828 he took a first-class in classics and a second-class in mathematics. He then entered the Middle Temple, and was called to the bar in 1831. In the year before he had, with John Romilly and John Stuart Mill, attended the celebrated lectures on jurisprudence delivered by John Austin at London University. In 1832 he undertook his first public work as one of the commissioners to inquire into the condition of the poor Irish residents in the United Kingdom.¹ Again, in 1834, Lord Althorp included him in the commission to inquire into the state of church property and church affairs generally in Ireland. To this fact we owe his work on *Local Disturbances in Ireland, and the Irish Church Question* (London, 1836), in which he condemned the existing connexion between church and state, proposed a state provision for the Catholic clergy, and maintained the necessity of an efficient workhouse organization. During this period of apprenticeship to politics Lewis's mind was much occupied with the phenomena of language. Before leaving college he had published some observations on Whately's doctrine of the predicables, and soon afterwards he assisted Thirlwall and Hare in starting the *Philological Museum*. Its successor, the *Classical Museum*, he also supported by occasional contributions. In 1835 he published an *Essay on the Origin and Formation of the Romance Languages* (re-edited in 1862), which, though anticipated by Schlegel, may be taken as the first effective criticism in England of Raynaud's theory of a uniform romance tongue, represented by the poetry of the troubadours. He also set an excellent example to county gentlemen by compiling a glossary of provincial words used in Herefordshire and the adjoining counties. But the most important work of this earlier period was one to which his logical and philological tastes both contributed. The *Remarks on the Use and Abuse of some Political Terms* (London, 1832) may have been suggested by Bentham's *Book of Parliamentary Fallacies*, but it shows all that power of clear sober original thinking which marks his larger and later political works. And yet this original mind did more than most scholars in the humbler walk of useful translation. He translated Boeckh's *Public Economy of Athens* and Müller's *History of Greek Literature*, and he assisted Tufnell in the trans-

¹ See the Abstract of Final Report of Commissioners of Irish Poor Enquiry, &c., by G. C. Lewis and N. Senior, 1837.

lation of Müller's *Dorians*. Some time afterwards he edited a text of the *Fables* of Dabryus. While his friend Hayward conducted the *Law Magazine*, he wrote in it frequently on such subjects as secondary punishments and the penitentiary system. In 1836, at the request of Lord Glenelg, he accompanied John Austin to Malta, where they spent nearly two years reporting on the condition of the island and framing a new code of laws. One leading object of both commissioners was to associate the Maltese in the responsible government of the dependency. On his return to England Lewis succeeded his father as one of the principal poor-law commissioners. But his literary activity did not cease. In 1841 appeared the *Essay on the Government of Dependencies*, a systematic statement and discussion of the various relations in which colonies may stand towards the mother country. In 1844 Lewis married Lady Maria Theresa Lister, sister of Lord Clarendon, and a lady of literary tastes. Much of their married life was spent in Kent House, Knightsbridge. They had no children. In 1847 Lewis resigned his office. He was then returned for the county of Hereford, and Lord John Russell appointed him secretary to the Board of Control, but a few months afterwards he became under secretary to the Home Office. In this capacity he introduced two important bills, one for the abolition of turnpike trusts and the management of highways by a mixed county board, the other for the purpose of defining and regulating the law of parochial assessment. On the latter subject his evidence before the select committee (Lords) of 1850 is the clearest statement of general results which we have. In that year he succeeded Hayter as financial secretary to the Treasury. About this time, also, appeared his *Essay on the Influence of Authority in Matters of Opinion*. Lewis seems to have thought that authority was too much divided to be of much use in theological matters, while in the world of science he found sufficient authority for declaring that homoeopathy, mesmerism, and phrenology were all impostures. On the dissolution of parliament which followed the resignation of Lord John Russell's ministry in 1852, Lewis was defeated for Herefordshire and then for Peterborough. Excluded from parliament he accepted the editorship of the *Edinburgh Review*, which the death of Empson had left vacant. Lord Halifax offered him, in 1853, the governorship of Bombay, but he remained editor until 1855. During this period he did some public work on the Oxford commission, and on the commission to inquire into the government of London. But its chief fruits were the *Treatise on the Methods of Observation and Reasoning in Politics*, and the *Enquiry into the Credibility of the Early Roman History*,¹ in which he vigorously attacks the theory of epic lays and other theories on which Niebuhr's reconstruction of that history had proceeded. In 1855 Lewis succeeded his father in the baronetcy. He was at once elected member for the Radnor boroughs, and Lord Palmerston made him chancellor of the exchequer. The position was difficult, for he had a war loan to contract and heavy additional taxation to impose. But his industry, method, and clear vision carried him safely through. His financial statement of 13th February 1857, and his speech on 13th February 1858 on the bill for the better government of India were most successful efforts. After the change of ministry in 1859 Sir George became home secretary under Lord Palmerston, and in 1861, much against his wish, he succeeded Sidney Herbert (Lord Herbert of Lea) at the War Office. The closing years of his life were marked by increasing intellectual vigour. In 1859 he published an able *Essay on Foreign Jurisdiction and the Extradition of Criminals*, a subject to which the attempt on Napoleon's

life, the discussions on the Conspiracy Bill, and the trial of Bernard, had drawn general attention. He advocated the extension of extradition treaties, and condemned the principal idea of *Weltrichtsordnung* which Mohl of Heidelberg had proposed. His two latest works were the *Survey of the Astronomy of the Ancients*, in which, without professing any knowledge of Oriental languages, he applies a sceptical analysis to the ambitious Egyptology of Bunsen, and the *Dialogue on the Best Form of Government*, in which, under the name of Crito, the author points out to the supporters of the various systems that there is no one abstract government which is the best possible for all times and places. An essay on the *Characteristics of Federal, National, Provincial, and Municipal Government* does not seem to have been published. Sir George died in April 1863. A marble bust by Weekes stands in Westminster Abbey. He has two other monuments—the reprint from the *Edinburgh Review* of his long series of papers on the *Administrations of Great Britain* (1864), and his *Letters to various Friends* (1870), edited by his brother, who succeeded him in the baronetcy.

Lewis was a man of mild and affectionate disposition, much beloved by a large circle of friends, among whom were Sir E. Head, the Grotes, the Austins, Lord Stanhope, J. S. Mill, Dean Milman, the Duff Gordons. In public life he was distinguished, says Lord Aberdeen, "for candour, moderation, love of truth." He had a passion for the systematic acquirement of knowledge, and a keen and sound critical faculty. Nothing is more remarkable than the practical good sense of his speculative writings. Sometimes he betrayed a slight intellectual impatience; but this was merely the passing irritation of a healthy and modest judgment.

LEWIS, MATTHEW GREGORY (1775-1818), often referred to as "Monk" Lewis, was born in London on July 9, 1775. He was educated for a diplomatic career at Westminster School and at Christ Church, Oxford, spending most of his vacations abroad in the study of modern languages; and in 1794 he proceeded to the Hague as attaché to the British embassy. His stay there lasted only a few months, but was marked by the composition, in ten weeks, of *Ambrosio, or the Monk*, which was published in the summer of the following year. It immediately achieved extensive celebrity; but some passages it contained were of such a nature that about a year after its appearance an injunction to restrain its sale was moved for and a rule nisi obtained. Lewis published a second edition from which he had expunged, as he thought, all the objectionable passages, but the work still remains of such a character as almost to justify the severe language in which the author of *English Bards and Scotch Reviewers* addresses—

"Wonder-working Lewis, Monk or Bard,
Who fann would't make Parnassus a churchyard,
Ere Satan's self with thee might dread to dwell,
And in thy skull discern a deeper hell."

Whatever its demerits, ethical or æsthetic, may have been, *The Monk* did not interfere with the reception of Lewis into the best English society; he was favourably noticed at court, and almost as soon as he came of age he obtained a seat in the House of Commons as member for Hindon, Wilts. After some years, however, during which he never ventured to address the House, he finally withdrew from a parliamentary career. His tastes lay wholly in the direction of literature, and *The Castle Spectre* (1796, a musical drama of no great literary merit, but which enjoyed a long popularity on the stage), *The Minister* (a translation from Schiller's *Kabale u. Liebe*), *Rolla* (1797, a translation from Kotzebue), with numerous other operatic and tragic pieces, appeared in rapid succession. *The Bravo of Venice*, a romance translated from the German, was

¹Translated into German by Liebrecht, Hanover, 1858.

published in 1804, and has since been reprinted; next to *The Monk* it is the work connected with the name of Lewis which has been most extensively read. By the death of his father he succeeded to a large fortune, and in 1816 embarked for the West Indies to visit his estates; in the course of this tour, which lasted four months, the *Journal of a West Indian Proprietor*, published posthumously in 1833, was written. A second visit to Jamaica was undertaken in 1817, in order that he might become further acquainted with, and able to ameliorate, the condition of the slave population, but the fatigues to which he exposed himself in the tropical climate brought on a fever which terminated fatally on the homeward voyage, May 14, 1818. *The Life and Correspondence of M. G. Lewis*, in two volumes, was published anonymously in 1839; compiled by friendly hands, it makes it sufficiently plain that, whatever may have been the errors of judgment and taste displayed in the writings of his precocious youth, he was nevertheless a man of more than ordinary discretion, good feeling, and generosity.

LEWIS, MERIWETHER (1774–1809), American explorer, was born near Charlottesville, Virginia, August 18, 1774. In 1794 he volunteered with the troops called out to suppress the "whisky insurrection," was commissioned as ensign in the regular army in 1796, and as captain in 1800, and was President Jefferson's private secretary from 1801 to 1803. On Jefferson's recommendation he was appointed by Congress to conduct, in connexion with Captain William Clarke, an expedition to the headwaters of the Missouri river, and thence across the mountains to the Pacific Ocean—the first extended exploration of the north-western portion of the United States. The States had as yet acquired no claim to this region, and the exploration was designed by Jefferson in the interests not only of geographical science but of territorial acquisition. Lewis and Clarke, setting out late in 1803 with twenty-eight men, spent the winter at the mouth of the Missouri. Early in the spring the party embarked in several boats, and during the summer made the difficult ascent of the Missouri as far as 47° 21' N. lat., where the second winter was passed among the Mandan Indians. In 1805 the ascent of the Missouri was continued as far as the tributary which they named Jefferson river, which was followed to its source in the south-western part of what is now Montana territory. Procuring a guide and horses from the Shoshone Indians, they pushed westward through the mountains, and on October 7 embarked in canoes on a tributary of the Columbia river, the mouth of which they reached on November 15. They had travelled upwards of 4000 miles from their starting point, had encountered various Indian tribes never before seen by whites, had made scientific collections and observations, and were the first explorers to reach the Pacific by crossing the continent north of Mexico. After spending the winter upon the Columbia, they made the return journey across the mountains and down the Missouri, reaching the Mississippi in September 1806. The reports of the Lewis and Clarke expedition attracted great attention at the time, and it has scarcely been exceeded in romantic interest by later explorations in any quarter of the globe. The leaders and men of the exploring party were rewarded with liberal grants of land, and Lewis was made governor of the territory of Missouri. In the unwonted quiet of his new duties his mind, always subject to melancholy, became unbalanced, and, while on his way to Washington, he committed suicide near Nashville, Tennessee, October 11, 1809.

Jefferson wrote a memoir of Lewis, published in 1814 in connexion with Biddle and Allen's *Narrative of the Lewis and Clarke Expedition*. A new edition by M'Vicker was published at New York in 1848.

LEWISTON, a city of the United States, in Androscoggin county, Maine, is situated 38 miles north of Portland, on the left bank of the Androscoggin, and is connected by several bridges with Auburn, a city of 9566 inhabitants, and the capital of the county. As the river at this point breaks over a ledge of mica schist and gneiss, and the natural fall of 40 feet has been raised to 50 feet by a strong granite dam, Lewiston commands an abundant supply of water-power. Cotton and woollen goods (slirtings, sheetings, cassimeres, beavers, tweeds, cloakings, twines, boots and shoes, machinery, &c., are produced to the annual value of \$11,000,000—there being nine considerable manufacturing corporations in the city besides the Franklin Company, which owns the entire water-power. The city hall (1872) is a very fine building, and a public library (over 6000 volumes in 1880) was founded by the corporation in 1861. Bates College, founded by the Free Baptists in 1863–64, and named in honour of Benjamin F. Bates of Boston, possessed in 1880 11 professors, 161 students, and a library of 6537 volumes.

Lewiston dates from 1770. In 1786 it was incorporated as a town, and in 1821 as a city. The population was 3684 in 1850, 7424 in 1860, 18,600 in 1870, and 19,088 in 1880.

LEXINGTON, capital of Fayette county, Kentucky, is situated near the centre of the State, in the midst of a table-land 1100 feet above the sea, known as the Blue Grass region. It stands on a small tributary of the Kentucky river, 79 miles south of Cincinnati, and 94 miles east by south of Louisville. The population (3584 in 1850, 7424 in 1860, and 13,600 in 1874) in 1880 was 16,656, including about 8000 negroes. Lexington is an important railway junction, has an extensive trade, and manufactures whisky, flour, bagging, ropes, carriages, and machinery. Two railroads, completed in 1859, give access to the mountainous eastern region of the State, from which iron, coal, and timber are obtained in abundance. The surrounding district is characterized at once by beauty and fertility, and the town has been laid out in a spacious and attractive style. It is the seat of the State university (chartered in 1855, originally opened at Harrodsburg in 1859, and removed to Lexington and incorporated with the Transylvania university in 1865), the State agricultural college, and one of the State lunatic asylums (625 patients). Besides the university library, there is a public library of 15,000 volumes.

Lexington was founded by Colonel Robert Patterson in 1775, and received its name in honour of the first contest in the war of American independence, fought in April of that year at Lexington, Middlesex county, Massachusetts.

Lexington in Kentucky must not be confounded with (1) Lexington, the capital of Lafayette county, Missouri, with a population in 1880 of 3996; or (2) Lexington, capital of Rockbridge county, Virginia, a place of 2771 inhabitants, and the seat of the Washington and Lee university (founded in 1749; professors in 1880, 6; students, 800; library, 15,000 volumes), and of the Virginia military institute, founded in 1839, under the patronage of the State, with 12 professors and 800 students.

LEYDEN, or LEMDEN, a city of the Netherlands, in the province of South Holland, about 20 miles south-west of Amsterdam, and 6 miles inland from the German Ocean. The Old Rhine, on which it is situated, enters at the eastern side by two arms which unite near the middle of the town so as to divide the western half into two nearly equal portions. Though the boundaries, which now include about 467 acres, have been six times extended, the general shape is wonderfully regular, nor is regularity wanting in the interior arrangement of the quiet respectable town with its canals and moats, its broad streets, and lifeless squares. The pensive and even melancholy impression which it seems sometimes to produce on the stranger is easily explained. Leyden is *par excellence* an academic city; the bustle of its great markets for cattle and dairy produce is

confined to certain spots, and lasts only for so many hours on so many days, and its industrial activity, considerable though it be, is not sufficient to give that appearance of life and movement which their flourishing local and transit trade makes so generally characteristic of the towns of Holland. The woollen goods (cozzlets and broadcloths), the cotton stuffs, the worsted and yarns, the non and copper wares, and the books and lithographic work which it still produces, are far from maintaining for it the position which it enjoyed when, at the close of the 15th century, its weaving establishments (mainly broadcloth) numbered from three to four hundred, or when, after the expulsion of the Spaniards, Leyden cloth, Leyden balze, and Leyden camlet became familiar terms at home and abroad. Owing to changes of fashion, unwise preservation of old customs and institutions, party spirit, the development of manufactures in other places, these industries had so far declined in the beginning of the 19th century—the total production of all the factories in 1802, for example, did not exceed 1086 pieces of cloth—that the balze manufacture was altogether given up, and the beautiful Say (Worsted) Hall was closed. Although after the revolution of 1813 comparative prosperity was the result of the removal of the French yoke, and more especially of the

Plan of Leyden

introduction of steam, the times of a Maurice or a Frederick Henry have never returned, and still less the wonderful days of the 15th century. The university is still a flourishing institution, with fifty professors, but other universities have grown up in the Netherlands, and even professors of European reputation can no longer attract from foreign lands the numbers that visited Leyden in the days of Lipsius, Vossius, Heinsius, Gronovius, Hemsterhuis, Ruhnken, Valckenae, Sealiger, and Boerhaave. As a class the students are remarkably quiet and orderly. Many are destined to a diplomatic career. The university (*Akademie*) was opened in February 1575, and originally located in the convent of St Barbara. In 1581 it was transferred to the convent of the White Nuns, the site of which it still occupies, though the building was destroyed in 1618. Of the institutions connected with the university it is sufficient to mention the library (upwards of 160,000 volumes and 4650 MSS, and 2400 pamphlet portfolios), rich in Oriental and Greek manuscripts and old Dutch travels, the botanic gardens, with splendid collections of East Indian plants; the observatory (1860), the museum of natural history, one of the principal establishments of its kind in Europe, the museum of antiquities, with a specially valuable Egyptian department; the ethnographical museum, of which the nucleus was Von Siebold's Japanese collections, and the national insti-

tution for East Indian languages, ethnography, and geography. The Thysian library and the library of the Society of Dutch literature (1769) are both large collections, the former especially rich in legal works and native chronicles, the great school of navigation, and the Remonstrant seminary, transferred from Amsterdam in 1873, deserve special mention, and in general it may be said that there is no city in the Netherlands better supplied than Leyden is with educational and intellectual institutions.

Objects of artistic and antiquarian interest are fewer than might be expected from the position which Leyden holds in the history of painting (Rembrandt, Jan Steen, and Gerard Douw were natives of the town), but such as they are—pieces by Van Finck, F. van Mieris, Cornelis Engelbichtszoon, Lucas de Leyden, and other masters—they have for the most part been collected in the newly founded municipal museum located in the old cloth hall. More interesting is the great collection of portraits of famous professors in the aula of the university. All the gate-houses of the city were still standing about the close of the 17th century, two only, the Zylpoort and the Morselpoort have been spared. The old town-hall is a quaint 16th century building, and St Pancratius church has some striking features. Near the site of the Rijnburg gate is the statue of Boerhaave by Stracké. The "Burg," on an artificial mound (perhaps of Roman origin) in the centre of the town, is an old circular wall resting on twenty arches, it forms a favourite promenade, and affords a fine point of view. Towards the south side of the town lies an open space, suggestively called the Ruin, which in 1807 was the scene of a terrible disaster, a powder-ship blowing up and destroying eight hundred houses and killing hundreds of men. In 1623 the population of Leyden was much more than 50,000, and in 1640, it is estimated, reached 100,000. Between 1706 and 1811 it sunk to 30,000. In 1850 it was 35,864, in 1870, 38,943 (9632 Roman Catholics, 396 Jews), and in 1882 about 41,000.

Though *Lugdunum Batavorum* is used by the learned as the Latin name for Leyden, there is no possibility of identifying the town itself with the *Lugdunum* of the Romans. It first appears in 11th and 12th century documents as *Leithon*, *Leithon*, and *Leithan*. The history of Leyden follows the same general lines as the history of the Netherlands. During the period of the counts the city suffered from the quarrels of one count with another (as when Countess Ada was besieged in the castle by Lewis of Loon in 1203), or of the nobles with the citizens, between 1419 and 1456 it was besieged and captured no less than six times by the "Rooks" or the "Cods." From Philip V. it received the confirmation of its privileges (1266) and of its freedom from toll throughout Holland (1290). During the struggle with Spain Leyden covered itself with glory by the resistance with which it held out against the double siege from 31st October 1573 to 21st March 1574, and from 22nd May to 21st October (see *Motley, Rise of the Dutch Republic*, vol. n). With the internal troubles of the 17th century it was closely connected. Coolhaas, one of the first professors of its university, gave rise about 1578 to a question of hierarchy which formed in some sort the prelude to the great contest in which his successors Arminius and Gomarus were protagonists. In 1597 Levensteyn vainly attempted to bring the city over to his side, in 1618 Maurice was so violently disturbed in connexion with the elevation of William III. to the stadtholdership. The revolution, excited by the French, took place in 1798; and in 1818 the Rhénish peasants, in revolt against the conscription, marched into the city. In 1836 there was a great inundation caused by the Esclavier Lake. The bicentenary of the university was celebrated with great ceremony in 1874.

See Miers, *Beschreibung der Stadt Leyden*, 1772-84.

LEYDEN, JOHN (1775-1811), was born on the 8th of September 1775, at Denholm on the Tiviot, not far from Hawick. Like most Scottish villages, Denholm is commonplace and uninteresting, but Leyden's upbringing was in a wilder part of the country, at the foot of Ruberslaw, whither his father had gone as shepherd to a relation of

the family. Though he did not attend school till he was nine years old, long before that he had learnt at home to read, and had devoured all the books he could lay his hands on in the border farm houses and cottages. Naturally his parents thought that a boy so fond of letters was meant for something else than shepherding; and, as the only scholarly office clearly within their horizon was that of a parish minister, they concluded that his gifts pointed in that direction, and with much stinting of their own little comforts sent him to Edinburgh university in 1790. There the uncouth lad, dressed in rough homespun, with a voice that smacked strongly of the Jed and the Teviot, played his part manfully enough in the class-work, but still better in the "societies" where Brougham, Jeffrey, Sydney Smith, Horner, and other clever young fellows were then chopping logic and cracking jokes. Leyden was a diligent but somewhat miscellaneous student, reading everything apparently, except theology, for which he seems to have had no taste. Accordingly, though he completed his divinity course, and took licence from the presbytery of St Andrews, and preached occasionally, it soon became clear that the pulpit was not his vocation, and that the border shepherds were not to find a second Thomas Boston in John Leyden.

In 1794 Leyden had formed the acquaintance of Dr Robert Anderson, editor of *The British Poets*, and of *The Literary Magazine*, a cultivated but not otherwise remarkable individual, who, however, filled a rather important niche in the Edinburgh of that time. Contributions to his magazine were probably what brought them first together, but more important results followed from their intimacy than either the verses on "Rubenslaw," or "The Descent of Odin," translated from the Norse. For it was Anderson who introduced him to Dr Alexander Murray, and Murray, probably, who led him to the study of Eastern languages, to which that great scholar was so passionately devoted. Soon they became warm friends and generous rivals, though Leyden excelled, perhaps, in the rapid acquisition of new tongues, and acquaintance with their literature, while Murray was the more scientific philologist. Through Anderson also he came to know Richard Heber, by whom he was brought under the notice of Walter Scott, when he was collecting materials for his *Minstrelsy of the Scottish Border*. Leyden was admirably fitted for helping in this kind of work. A borderer himself, an enthusiastic lover of old ballads and folk-lore, he spared no pains to enrich the work that promised to bring fame to his beloved hills and glens. Scott tells us how, on one occasion, Leyden walked 40 miles to get the last two verses of a ballad, and returned at midnight, singing it all the way with his loud, harsh voice, to the wonder and consternation of the poet and his household. Neither Scott nor Leyden, however, studied this folk-lore for proper scientific purposes. They cared only for the picturesque and the poetic in it, and were not very successful in their efforts to restore it to life. Of course, the rough old ballads themselves were a welcome addition to our literature, but Leyden's attempt to make Lord Soulis interesting in a modern ballad was something of a failure, and, though he might have made a Scotch Lorelei out of the mermaid of Corrievekan, his poem wants the delicate touch of the German, and he does not know where to stop. Scott, however, got valuable assistance from him in his task, and learned to esteem highly the blunt integrity of the man, his literary enthusiasm, and his large attainments.

Leyden was evidently drifting away from the church into the life of a scholar, but as yet he had not found his line there, was indeed only wasting himself on miscellaneous learning. He had compiled a work of four hundred pages on the *Discoveries and Settlements of Europeans in Northern*

and Western Africa, suggested by Mungo Park's travels. He had edited for Constable *The Complaint of Scotland*, giving a glossary, and a long preliminary dissertation. He had printed various poems, and nearly finished his *Scenes of Infancy*, a poem in four books, based, no doubt, on border scenes and traditions, but meandering "as its own sweet will" over all the world, and a good way beyond it. There are, here and there, some effective enough lines in this poem, but, in the main, it is of the thin, artificial, big-sounding order, and has no unity of design, so that there is no particular reason why it should not go on for ever. He had also made some translations from Eastern poetry, Persian and Arabic, but they have not somehow the aroma of the East. Clearly, here was a man of great and varied powers which, however, were like to run to waste unless he found a definite field to work in. So, at last, friends got him an appointment in India, at first on the medical staff, for which he qualified by a year of intense hard work; but it was hoped something more fitting would turn up by and by. In 1803, therefore, he sailed for Madras, and took his place in the general hospital there. From that he was soon promoted to be naturalist to the commissioners going to survey Mysore. Ere long, however, his knowledge of the languages and dialects of India procured him an appointment as professor of Hindustani, which he soon after resigned for a judgeship, and that again to be a commissioner in the court of requests, which required a familiarity with several Eastern tongues. Friends who had come from the same border country—Lord Minto, Sir John Malcolm, and others—had done what they could to make his path smooth for him, and his linguistic attainments had been recognized by Colebrooke, the greatest Oriental scholar of the day. But in 1811, having joined Lord Minto in the expedition to Java, on landing there he made his way into a library which was said to contain many Eastern MSS., without having the place aired, and was seized with shivering and sickness, first symptoms of the Batavian fever. The climate of India had never agreed with him, and his constitution had already been shaken by several serious illnesses. He was ill fitted, therefore, to endure the assault of this deadly complaint, and after three days of struggle he died on the 28th of August, in the thirty-sixth year of his age. Cut off thus prematurely, he has left comparatively little fruit of all the bright promise of his youth. As a poet he cannot take high rank, but in his knowledge of Eastern languages he would probably have been no mean rival of Henry Colebrooke, had he been spared a little longer to methodize and perfect his attainments. A genuine and generous nature, with a fine enthusiasm for learning, there were few of Britain's sons in India from whom friends at home looked for better work, and few therefore who were more deeply regretted (w c s *)

LEYDEN, LUCAS VAN. See LUGAS.

LHASA, often written LASSA, for many centuries the chief city of Tibet. Though the place is of great celebrity, the accounts of it are scanty, and information has to be sifted from authorities differing considerably in age. Till recently the latitude even of Lhasa has been stated with variations extending over 1½ degrees, whilst the longitude has naturally been still more uncertain. The Jesuit Grueber, who was at Lhasa in 1661-62, made the latitude 29° 6'. In the maps of Tibet sent from China by the Jesuits, and engraved on five separate sheets in Du Halde, it is about 29° 40'. D'Anville, in his *Carte Générale du Tibet*, chiefly based on these last, but modified to suit other data, reverted nearly to Grueber's figure; Giorgi in his *Alphabetum Tibetanicum* states it at about 30° 30'. Klaproth, stretching every datum to cracking point, to suit his fantasies about the course of the great river of Tibet, made it 30° 45' lat (and 91° 50' long.); our last and

highest authority, Pandit Nain Singh, gives (from a mean of twenty observations) $29^{\circ} 39' 17''$, a result which closely confirms the Jesuit record. The longitudes according to the protraction of the same explorer's route is $90^{\circ} 57' 13''$.¹ The height above the sea, by repeated observation of the boiling point, is stated at 11,700 feet (but the report of Nain Singh, on his second visit, gives 11,910). The city stands near the middle of a tolerably level plain, which is surrounded on all sides by hills, and extends about 13 miles from east to west and about 7 miles from north to south. It lies half a mile to the north of a considerable river called the Kichu Tsanpu, or Tsang-chu, flowing here from east-north-east (called by the Mongols, according to Klaproth, *Galyao-Murea*, or "Turbulent River"), and joining the great Tsanpu (or upper course of the Brahmaputra) some 35 miles to the south-west.

The hills round the city are absolutely barren, and without growth of any kind except an occasional bush of so-called "Tartar furze." There are, however, gardens scattered over the plain round the city, and these are planted with trees of some size (it would seem cedar, willow, and cypress). Four defiles in the encompassing hills, by which the approaches to the city pass, are defended by as many forts. We may quote the description of Huc, which, though a little vague, is vivid, and is the only passage affording anything like a picture of this city, so difficult of access:—

"The sun was about to set as we completed our descent of the innumerable zigzags of the mountain path. Issuing into a wide valley, we beheld on our right Lhasa, the famous metropolis of the Buddhist world. The multitudes of aged trees which encircle the city as with a garle of foliage, the lofty white houses, terminating in flat roofs surrounded by terraces, the numerous temples with their gilt canopies, the Buddhists' *Prasads*, crowned by the palace of the Dalai Lama,—all unite to give Lhasa a majestic and imposing appearance."

The meaning of the name *Lha-Sa* is "God's ground." Formerly it used to be known to the Mongols as *Baron-tala*, the "right side" or western region; now, according to Huc they call it *Monke Dhot* or *Dekot*, "Eternal Sanctuary."² In eastern Turkistan it seems to be best known as *Jo*, a name which properly refers to the great central temple of which we shall speak.

The city is nearly circular in form, and according to Nain Singh less than a mile in diameter. It was walled in the latter part of the 17th century, but the walls were destroyed during the Chinese occupation in 1722. The population has been estimated at 40,000 to 80,000; the last estimate perhaps including the great population of monks and students in the convents near the city.³

The chief streets of the city are wide and straight, and in dry weather tolerably clean, but the inferior quarters are unspeakably filthy, and are rife with evil smells and large mangy dogs.⁴ Part (much the greater part, according to Nain Singh) of the houses are of clay and sun-dried brick, but those of the richer people of stone and brick. All, however, are frequently white-washed, the doors and windows being framed in bands of red and yellow. In the suburbs there are houses entirely built of the horns of sheep and oxen set in clay mortar. This construction, according to Huc, is very solid and highly picturesque.

The houses generally are large, and of three stories at least. The owner of the house, with his family, occupies the upper story, whilst the two lower floors swarm with tenants. Externally the lower part of Tibetan houses generally presents lofty dead walls pierced by a few air-holes only, above these run tiers of windows with projecting balconies, and over all flat broad-eaved roofs at varying levels. According to Desideri, in the better houses there are often spacious and well-finished apartments, the principal halls, the verandas, and terraces being often paved with a composition of coloured fragments of stone set in a cement of resin, &c., which with much beating and rubbing becomes like a surface of polished porphyry. In every house there is a kind of chapel or shrine, carved and gilt, on which are set images and sacred books, and before them lamps and incense, with the usual offerings of barley, fruits, &c.

Lhasa is not only the nucleus of a cluster of vast monastic establishments, which attract students and aspirants to the (so-called) religious life from all parts of Tibet and Mongolia, and the seat of a quasi papacy, but is also a great place of pilgrimage, so that the streets and public spaces swarm with visitors from every part of the Himalayan plateau, and from all the steppes of Asia between Manchuria and the Balkash Lake, who come to adore the living Buddha, to seek the purgation of their sins and the promise of a happy transmigration, and to carry away with them holy relics, blessed rosaries, and all the miscellaneous trumpery which is set forth to catch the money of idle people in Asia and Europe, whether they are pilgrims or frequenters of mineral waters.⁵ whilst as usual a great traffic arises quite apart from the pilgrimage. The city thus swarms with crowds attracted by devotion and the love of gain, and presents an astonishing diversity of language, costume, and physiognomy; though, in regard to the last point, varieties of the broad face and narrow eye greatly predominate. Much of the retail trade of the place is in the hands of the women. Huc's account of the curious practice of the Lhasa women in plastering their faces with a dark-coloured unguent is well known, but it does not rest on his authority alone.

During the month of December especially traders arrive from western China by way of Tatsienlu (Tachindö of the Tibetans), bringing every variety of silk-stuffs, carpets, china-ware, and tea, from Siningfu (commonly in Tibet and Turkistan called *Sining*, Ziling, or Ziling, a circumstance that has caused sundry misapprehensions) come silk, gold lace, Russian goods, carpets of a superior kind, precious stones, horse furniture, horses, and a very large breed of fat-tailed sheep, from eastern Tibet much in large quantities, which eventually finds its way to Europe through Nepal; from Bhutan and Sikim, rice, from the latter also tobacco; besides a variety of Indian and European goods from Nepal and Darjiling, and *charas* (resinous exudation of hemp) and saffron from Ladak and Kashmir. The merchants, who arrive in December, leave Lhasa in March, before the setting in of the rains renders the rivers impassable.

The tea importation from China is a large matter, on which an interesting paper has been written by Mr. E. Baber. The tea is of the coarsest quality, derived from straggling and uncared-for trees, allowed to grow to a height of 10 feet or more, and the coarsest produce of these. This is pressed into bricks or cakes, and carried by porters. The quantity that pays duty at Tatsienlu is about 10,000,000 lb., besides some amount smuggled. No doubt a large part of this comes to Lhasa. Tea is an

¹ This is corrected to the latest value of Madras longitude, viz., $80^{\circ} 14' 51''$.

² The first word of this phrase is certainly the Mongol *munke*, "eternal." The second is probably a clerical error for *dekot*, which may represent the *Jo* of the next sentence, which is literally (Tib.) "master, lord," and is applied to very sacred images.

³ Nain Singh says that a census in 1854 gave "9000 women and 6000 men, exclusive of the military and the priests." But these words are subject to too many doubts for precise interpretation.

⁴ The Chinese have a proverb as to the three products of Lhasa being dogs, drabs, and lamps.

⁵ Among articles sold in the Lhasa bazaar are numerous fossil bones, called by the people "lightning bones," and believed to have healing virtues.

absolute necessity to the Tibetan, he is miserable without it.

The chief industries of Lhasa are the weaving of a great variety of stuffs from the fine Tibetan wool, the making of earthenware (said to be of very good quality), and of the wooden pottages (varying immensely in elaboration and price) of which every Tibetan carries one about with him; also the making of certain fragrant sticks of pastille much valued in China and elsewhere.

It is curious that Tibet, though using coined money, seems never, strictly speaking, to have had a coinage of its own. Till nearly the end of last century the coinage had for a long time been derived from Nepal. That valley prior to the Gorkha domination (1768) was under three native dynasties (at Blatgaon, Patan, and Khatmandu), and these struck silver mohurs, as they were called, of the nominal value of half a rupee. The coins were at first not struck specially for Tibetan use, but were so afterwards. These latter bore (obverse) a Nepalese emblem surrounded by eight fleurons containing the eight sacred Buddhist jewels, and (reverse) an eight petaled flower surrounded by eight fleurons containing the names of the eight jewels in Tibetan characters. Ingots of Chinese silver were sent from Lhasa with a small proportion of gold dust, and an equal weight in mohurs was returned, leaving to the Nepal rajahs, between gold-dust and alloy, a good profit. The quality of these coins (weighing about 81 grains Troy) was low, and at last deteriorated so much that the Tibetans deserted the Nepal mints. The Gorkhas, after becoming masters of Nepal, were anxious to renew the profitable traffic in coin, and in this view sent a deputation to Lhasa, with a quantity of coin to be put in circulation. But the Gorkhas were mistrusted, and their coin refused. A coinage was then issued (it would appear once only) in Tibet for domestic use, modelled on an old Khatmandu pattern, and struck by Nepalese artists (see fig. 1). The Gorkhas, however,

FIG. 1.—Coin struck in Tibet, from specimen in India Library, inscribed "27th year (of cycle=1772 A.D.) from the princely residence of Gulistan."

in 1788 and following years continued to strike coins of progressively debased quality, which were rude imitations of the old Nepalese mintage (see fig. 2), and to endeavour to force this currency on the Tibetans, eventually making the departure of the latter from old usage a pretext for war and invasion. This brought the intervention of the

FIG. 2.—Gorkha debased coinage, rubbing from coin in British Museum.

Chinese, who drove the Gorkhas out of Tibet (1792), and then began to strike silver coins for Lhasa use, bearing Chinese and Tibetan characters (see fig. 3). For practical use these Tibet-Chinese coins (of which $2\frac{1}{2}$ = 1

rupee, and which are known as *ashang*, i.e., *wuyshyang*, "cash"), are cut into oblong parts by the guidance of the figures on them. Large lumps of Chinese silver, stamped

FIG. 3.—Tibeto-Chinese coinage ("Kashang, 58th year," i.e., 1793 A.D.) From specimen in India Library.

with the imperial seal, are also used. But of late years there has been an enormous influx of Anglo-Indian rupees, so that these have become practically the currency of the country, even to the frontier of China, and are now counted, instead of being valued as bullion. They are called *Peking shrank*, or *chanka* (probably Hind *taika*), "English (Peking?) coins." Those that bear a crowned head of the queen are called *Lama* heads, the crown being taken for a wandering lama's head-gear. This great influx of rupees indicates a very considerable amount of trade with India. And, in spite of the extraordinary difficulties of the road eastward from Lhasa, quantities of trifling European articles find their way even to Tatsienlu on the Chinese frontier. Mr. Dabci found quarter-rupees very popular as buttons, British army buttons very common, corkscrews offered for sale (though no one knew their use), and tin-plates very common, stamped with the heads of Napoleon III, Mr. Gladstone, and other celebrities.

The permanent population embraces, besides Tibetans of the country, settled families of Chinese and Kashmiris in considerable numbers, as well as people from Bhutan and Nepal, from Ladak and even from Patna. The Kashmiris and many of the other foreigners are Mohammedans, and much of the trade is in their hands. Besides, a century and a half ago, speaks also of Armenians and even "Muscovites." The Chinese have a crowded burial-ground at Lhasa, tended carefully after their manner. The Kashmiris, who are called *Khach'hé*, are an important body, and have their mosque, and a provost, at once civil and religious, who is recognized by the Government. With their turbans, then fine Caucasian features, and their beards, they strikingly contrast with the mass of other nationalities. The Nepalese (called at Lhasa, according to Huc, *Pe-tan*) supply all the mechanics and metal-workers. There are among them excellent gold and silversmiths; and they make the elaborate gilded canopies crowning the temples, which form so notable a feature of Lhasa. Huc describes a stilted custom among the native population. Every evening, as light begins to fail, they leave off business, and form groups in the streets, all sit down and begin to chant prayer in a low voice. "The combination of religious music arising from these numerous companies produces an aggregate of vast and solemn harmony, which is exceedingly moving."

In the middle of the city is an open space or *place*, in which markets are held, this is densely thronged in the afternoon and evening. On the north side, overlooking this *place*, is a great building which is the residence of the *Gyalpo*, or so-called king of Tibet. It was built at great cost by the dissolute Lama who was set up by the crafty regent Sangge Gyampo, and put to death by the Calmuck prince Latsan or Jangzh Khan in 1708-7 (see *infra*), and, as the Lama used to divert himself there with the dances of the ladies of Lhasa, the palace is known as the

Trasi khang or "dancing house" (so Desideri; the word *tras* cannot be identified).

Immediately west of the place stands the great temple and convent of Labrang (*bla-brang*, "lama-house"), regarded as the *umbilicus* and centre of all Tibet, and from which all the main roads are considered to radiate. This is not merely the great metropolitan convent, sanctuary, and church-centre of Tibet, the St Peter's or Lateran of Lamasim, but contains the palace of the government and seat of civil administration. It is believed to have been founded by the Tibetan Constantine, Srong-dsan-gampo, in the 7th century, as the shrine of one of those two very sacred Buddha images which were associated with his conversion, and with the foundation of the civilized monarchy in Tibet. From this image, called *Jo*, or *Jā*, it is known to the Mongols as the *Jo Erdeni* ("the precious Lord") or *Jo Shalyanant* (to the Chinese as *Ta-shao-er*, "house of the great Jā"), and hence as *Ju* or *Jo* simply, a name used in eastern Turkestan (as already noticed) and probably in Mongolia, as a synonym of Lhasa. The temple appears to be known also as *Lhasa Chhod-khang*, "offering-house of Lhasa," and among Indian and Nepalese visitors as *Molendra Nāh*.¹ The Potala as a sacred centre is modern, whilst the Labrang attaches itself to the whole thread of Tibetan history and religion. On one of the walls of this temple is a picture of the famous "Master of the Law," Hwen Tsang, the travelling doctor of Buddhism (see vol. xii, p. 418), whose journeys have in the revolution of the ages become so familiar to European students, as a mine of information on the geography and history of India during a period so clouded as the 7th century. He is represented with three of his disciples. And before the gate of the Labrang stand several monuments of antiquity, especially that famous obelisk spoken of below, which bears the inscribed record of the treaty of peace concluded in 822 between Thi-de-srong-tsan, king of Tibet, and the emperor Mo-tsung of China. Before this obelisk the apostate from Lamasim, Langdharma, brother and successor of the last-named king, was standing in proud contemplation, when a fanatic recluse, who had been stirred by a vision to avenge his persecuted faith, shot him with an arrow in the forehead.

The main building of the Labrang is three stories high. The entrance, facing eastward, forms a portico supported on six great timber columns, richly carved and gilt, whilst the walls are painted with the history of Sakya. Great folding-doors, covered with reliefs in bronze and iron, lead to the ante-hall, and from this a second gate to the *cella* (so to call it) of the temple. On each side of the gate, two and two, stand colossal of the spirit-kingdoms of the four points of heaven. Within is a great basilica, divided into nave and aisles by many pillars, whilst along each wall, north and south, are chapels or sanctuaries, fourteen to a side.

At the west end steps ascend to a quadrangular choir or chancel, on each side of which also are three chapels, and at the extremity a rectangular apse (if it may be called so), and in it is the altar or graded throne, on which stands the great image of Sakya, seen through a lattice of silver gilt—the higher shelves or offices of the altar being beset with small figures in precious metals of *devas* and *saints*, and the lower ones with lamps burning josticks, platters holding offerings of butter and meal, flowers modelled from butter, &c. In the choir to the right (i.e., looking from the altar) is the elevated and stepped throne of the Grand Lama, held with splendid cushions, surrounded by the nearly equal throne of the Fifth Lama of Shigatse, and then by the seats of other ecclesiastical potentates, reborn and elected, in order; on the left of the Buddha throne, opposite the Grand Lama's, and of equal height, there is said now to be a throne for the emperor of China, then, at a lower level, that of the so-called king of Tibet, whilst the ministers of state follow opposite the inferior lamas.

In a space shut in with silver lattice, on the south side of the

chancel-steps, are seen fourteen or fifteen great disks of silver, set with precious stones, on which are embossed fundamental Buddhist symbols, such as their system of cosmogony, the circles of transmigration, the births of Sakya, &c.

The great nave or central aisle of the basilica is truly hypæthral, but on the second and third uppermost decks it is encompassed with colonnades or verandas, from which the women and the laity look down upon the lamas engaged in chanting the services or in other functions. The sanctuary or chancel itself towers above the rest of the building, and is crowned with a rectangular canopy or pavilion of gilt metal, which rises to a ridge surmounted with fantastic figures. This canopy rests on columns which are also gilt, and from its eaves and angles hang bells that tinkle with every breeze, whilst the pillars beneath the eaves are crowned with a great fringe of bas-reliefs embossed in gilt metal.

This ancient temple contains a vast accumulation from the ages of gold and silver vessels, lamps, reliquaries, and precious bric-à-brac of every kind, which is annually exposed to view in the spring festivities. The daily offices in the Labrang are attended by crowds of worshippers, and a sacred way which leads round it is constantly traversed by devotees who perform the circuit as a work of merit, always in a particular direction.

Besides the convent-cells, halls of study, and magazines of precious lumber, buildings grouped about the Labrang are occupied, as we have said, by the civil administration, e.g., as treasuries, customs office, courts of justice, &c., and there are also private apartments for the Grand Lama and other high functionaries. No woman is permitted to pass the night within the precincts.

Another great and famous temple is the *Ramo-chhé* ("large pan or fold"), at the north end of the city. This is also regarded as a foundation of Srong-dsan-gampo, and is said to contain the body of his Chinese wife, and the second of the primeval palladia, the image that she brought with her to the Snow-land; whence the Mongols and Chinese call it the temple of the little *Jā*. The lamas of this convent, as well as of that next to be mentioned, are noted for their pretensions to and practice of magical arts, one of the degrading characteristics of the lama forms of Buddhism. The orthodox "yellow" sect indeed profess to distinguish between lawful and unlawful magical formulae, and to give degrees only in the former. The lamas of *Ramo-chhé* have also the ill repute of cultivating that species of doctrine which is connected, like their magic, with Tantric mysticism, and which professes to destroy sensual passion by the contemplation of its representations. The walls of the convent are defiled with a series of sculptures of gross obscenity.²

Another convent within the city is that of *Mora*, also near the north end, remarkable for its external order and cleanliness, and, though famous like the last as a school of orthodox magic, noted also for the printing-house in the convent garden. Lastly we notice the *Garnakhia*, the inmates of which are sorcerers of the rude kind, who seem really to represent the rude medicine-men of the superstitions which preceded Buddhism in Tibet. As the vulgar will not dispense with their marvels (knife-awallowing, fire-breathing, cutting off their own heads, and the like), every great orthodox monastery in Tibet keeps one of these conjurers, who does not belong to the fraternity of the house, but lives in a particular part of it, bearing the name of *Choi-chong* (*Khos-kyong*) or "protector of religion," and is allowed to marry. These practitioners of the black art possess no literature, but hand down their mysteries from father to son. Their fantastic equipment, their frantic bearing, and their cries and howls seem to identify them with the grossest Shamanist devil-dancers,—strongly remote in externals from the gentle and cultivated persons in the higher ranks of the Lama Church, of whom we read in Turner or Hux. Other monasteries in or near the city are the *Chumlung* at the north-west corner; the *Tankyating*

¹ So in Nau's Singh's narrative. But the word is properly *Mahendradh*, which is the name of a saint adored by the Nepalese Buddhists, and identified with Padmapani, the fourth Dhyan Bodhi-vast of their system (see Hodgkin in *Journ. Roy. As. Soc.*, xviii, 394).

² It was in this convent that P. Desideri studied the religion of the lamas. "From March to July," he says, "I set myself, I will not say to read, but rather to devour the chief books of the *Kao-n-shih*, and to take in a complete knowledge of all that pertains to that false religion."

at the west of the city, the *Kontsaling*, about a mile west of the city, at the foot of a low isolated hill called Chapochi. Three miles south, beyond the river, is the *Chokchaling*. These four convents are known as "The Four Ling."

Leaving the city by the side of the Namoch'he, we see on our left the famous Potala with its many edifices crowning and seeming to grow out of a rocky hill, which rises like an island from the plain. It forms altogether a majestic mountain of building. At the south base of the rock is a large space inclosed by walls and gates, with great porticoes on the inner side. This swarms with lamas, its nooks with boggans basking in the sun. A series of tolerably easy staircases, broken by intervals of gentle ascent, leads to the summit of the rock. The whole width of this is occupied by the palace. The central part of this group of buildings rises in a vast quadrangular

mass, in four stories, to a great height, terminating in a gilt canopy similar, it would seem, to that on the Labrang. Here on the lofty terrace is the Grand Lama's hall of audience, and from this great height he looks down upon the crowds of his votaries far below, thronging the plain, and screaming to kneel before the sacred hill. The monastic buildings attached to the palace temple are said to contain cells for ten thousand monks. Other palatial buildings, towers, chapels, *chollens* (chantyas), pavilions gleaming with gold and silver, Buddhas and other idols, cluster round and crown the three peaks of Potala. The palace itself is said to be painted externally with red and white stripes. The walls and ceilings of all the chief apartments and temples are covered with rich silks. We give an engraving of it (fig 4), extracted from a Chinese view of Lhasa, published by Klaproth in the work quoted

FIG 4.—Potala, the Palace-Temple of the Grand Lama

at the end. The Potala has every appearance of having been drawn from the reality. Two avenues bordered with trees of considerable size lead from the city to the foot of Potala. "You see there constantly," says Huc, "a great number of foreign pilgrims, passing between their fingers the beads of their long Buddhist rosaries, with lamas of the court splendidly attired, and mounted on richly caparisoned horses. There reigns in the neighbourhood of the Potala great and incessant movement, but for the most part everybody is grave and silent, religious thoughts appear to occupy the minds of all." It would seem that between the palace and the city runs a stream which is crossed by a bridge called "The Bridge of Glazed Tiles."

On the north side of the rock a wide and easy road descends winding. By this, which has a parapet along the edge, it is lawful to ride. Not far from the base is a garden-palace in the middle of a lake which is surrounded by trees and shrubberies. This palace, called *Lukhang*, is described by Desideri as of attractive style, and circular in form, with a *loggia* or portico running all round, and adorned with paintings. Here the dissolute Lama who built it, at the end of the 17th century, used to give himself up to dissipation with the women of Lhasa. Several other villas or gardens of the Tibetan people are mentioned; in one of them the Panch'then-Rinpoche (or Tesbu Lama) is received when he visits Lhasa, and the two living Buddhas drink tea together there. It is in the numerous gardens round the town that those large trees grow of which Huc

speaks as giving Lhasa such a green garb of foliage. There is no natural wood.

No country in the world—not even Spain or Italy in the last century—has so abounded in convents and monks as Tibet. The district of Lhasa alone is said to contain thirty great convents, besides many smaller establishments, and a notice of Lhasa would be incomplete without some mention at least of the great monastic establishments which stand within a few miles of the city, and constitute an essential element in its existence. These are not single masses of building like the great convents of Europe. The temple (*Lha-khang*) is the focus of the whole. Round this are gathered numerous houses detached from one another, though not far apart, and generally three stories in height. In each of these are various apartments, each assigned to a monk of some authority and dignity, with several younger members or novices under his immediate direction. Each house has a little garden, and a quantity of vases in which plants are grown. Library, storehouse, hostel, occupy other buildings, and a varying multitude of the peculiar Buddhist objects of adoration which we know as *dagobas* or *chaityas*, as well as of masks with sacred flags and streamers. The whole is usually enclosed in a lofty and solid wall. These establishments have undoubtedly a vast population, though we can hardly accept specific figures, in which indeed authorities do not agree. Huc says the inmates of each of the three great convents which we are about to name amounted to

15,000, Nam Singh states them at 7700, 5500, and 3300 respectively; the former numbers seem excessive, the latter artificial; but no doubt the real numbers are large. In the Labrang they show a copper kettle holding more than one hundred buckets, which was used to make tea for the lamas who took part in the daily temple service.

The three great convents in the vicinity, all claiming to be foundations of Tsongkhapa, the mediatorial reformer and organizer of the modern orthodox Lama Church, are the following—

1. *Bre-bung* (written *Brace-Pung*, "the Rice-Heap," so called from the shape of the hill on which it stands), called by Nam Singh *Lebang*, is 6 or 8 miles from Lhasa, west of the city, at the entrance to the plain from the side of Shigatse and Nepal. In the middle of the convent buildings rises a kind of pavilion, brilliant with colour and gilding, which is reserved for the Dalai Lama, when he visits Bre-bung once a year, and expounds to the inmates. The place is greatly frequented by the Mongol students who come to Lhasa to graduate, and is known in the country as the Mongol convent.

2. *Sera* ("The Golden"), is 2 or 3 miles from the city on the acclivity of the hills which border the valley on the north, and close to the road by which pilgrims enter from Mongolia. The hill is planted with holly and cypress, and from a distance the crowd of buildings and temples, rising in amphitheatres against a background of trees, forms a pleasing picture. In the recesses of the hill, high above the convent, are scattered cells of lamas adopting the solitary life. There are three great temples rising in many stories, the walls of which are entirely covered with gilding, whence the convent's name. In the chief of these temples is preserved the famous *Dorji* of Bon-lhas, the *Yogee* or *Thangka* (the latter word is properly, or Adamant, the symbol of the strong and unbreakable, which the priest grasps and manipulates in various ways during prayer. From this *dorji*, according to one etymology at least, comes the name of the Himalayan mountain *Dorjibud* or *Dorjaling*. The emblem is a bronze instrument, shaped much like a dumb-bell with pointed ends, and it is said by *Koeppen* to have been one of the later lama borrowings from *Srausma*. The original is carried solemnly in procession to Labrang during the New Year's festival. In *Sera* P. Desiderius found shelter during the capture of the city by the *Drangpa* Khan in 1717, speaking of below.

The hill adjacent to it is said to be rich in silver ore, but it is not allowed to be worked. On the summit is a spring, and a holy place of the Lhasa Mohammedans, who resort thither. Near the convent there is said to be gold, which is worked by the monks. "Should they discover a nugget of large size, it is immediately replaced in the earth under the impression that the nugget . . . germinates in time, producing the small lumps which they are privileged to search for" (Nam Singh).

3. *Golden*—This great convent is 10 or 12 miles east of Lhasa, on the other side of the *Kichu* Tsangpo river. It is the oldest monastery of the "Yellow" sect, having been founded by Tsongkhapa, and having had him for its first superior. Here his body is said to be preserved with miraculous circumstances, and here are other relics of him, such as the impression of his hands and feet in hard butter.

Samayé (*Sem-ye*) is another famous convent intimately connected with Lhasa, but it is some 85 miles south-east on the left bank of the great *Sera*. It was founded by Padma Sambhava (*U-shon* of the Tibetans), the apostle who came from Udayana in the fifth century as the great reviver of Buddhism, and was at the head of the old Red sect. It is visited by the Dalai Lama once a year. It is surrounded by a very high circular stone wall, 14 miles in circumference, with gates facing the four points of the compass. On this wall Nam Singh, who was here on his last journey (1874), counted 1030 *chavags* of brook. One very large temple (*Lha-khang*) occupies the centre, and round it are four smaller but still very large temples. Many of the walls are of pure gold, and the wealth is very great. The interior of the temples are covered with beautiful writing in enormous Nagari characters, which the vulgar believe to be the writing of Sakya himself.

Lhasa Festivities.—The greatest of these is at the new year. This lasts fifteen days, and is a kind of lama carnival, in which masks and mummings, wherein the Tibetans take especial delight, play a great part. The celebration commences at midnight, with shouts and clangour of bells, gongs, chank-shells, drums, and all the noisy repertory of Tibetan music; whilst friends exchange early visits and administer coarse sweetmeats and buttered tea. On the 2d day the Dalai Lama gives a grand banquet, at which the Chinese and native authorities are present, whilst in the public spaces, and in front of the great convents, all sorts of shows and jugglers' performances go on. Next day a regular Tibetan exhibition takes place. A long cable, twisted of leather thongs, is stretched from

a high point in the battlements of Potala slanting down to the plain, where it is strongly moored. Two men slide from top to bottom of this huge hypothesis, sometimes lying on the chest (which is protected by a breast-plate of strong leather), spreading their arms as if to swim, and descending with the rapidity of an arrow-flight. Occasionally fatal accidents occur in this performance, which is called "the dance of the gods", but the survivors are rewarded by the court, and the Grand Lama himself is always a witness of it. This practice occurs more or less over the Himalayan plateau, and is known in the neighbourhood of the Ganges as *Barat*. It is employed as a kind of expiatory rite in cases of pestilence and the like. And exactly the same performance is described as having been exhibited in St Paul's Churchyard before King Edward VI., and again before Philip of Spain, as well as, about 1750, at Hertford and other places in England (see Strutt's *Sports*, &c., 2d ed., p. 198).

The most remarkable celebration of the new year's festivities is the great jubilee of the *Monlam* (*Mon-lam*, "prayer"), instituted by Tsongkhapa himself in 1409. Lamas from all parts of Tibet, but chiefly from the great convents in the neighbourhood, flock to Lhasa, and every road leading thither is thronged with troops of monks on foot or horseback, on yaks or donkeys, and carrying with them their breviaries and their cooking-pots. They descend like swarms of bees upon the city, and those who cannot find lodging bivouac in the streets and squares, or pitch their little black tents in the plain. The festival lasts six days, during which there reigns a kind of saturnalia, and the town is abandoned to these crowds of monks. Unspeakable confusion and disorder reign, whilst gangs of lamas parade the streets, shouting, singing, and coming to blows. The object of this great disorderly gathering is, however, supposed to be devotional. Vast processions take place, with mystic offerings and lama-music, to the Labrang and Moru convents; the Grand Lama himself assists at the festival, and from an elevated throne beside the Labrang receives the offerings of the multitude, and bestows his benediction.

On the 15th of the first month multitudes of torches are kept ablaze, which lighten up the city to a great distance, whilst the interior of the Labrang is illuminated throughout the night by innumerable lanterns shedding light on coloured figures in bas-relief, framed in arabesques of animals, birds, and flowers, and representing the history of Buddha, and other subjects, all modelled in butter. The figures are executed on a large scale, and, as described by Huc, who witnessed the festival at Kunbum on the frontier of China, with extraordinary truth and skill. These singular works of art occupy some months in preparation, and on the morrow are thrown away. On other days horse-races take place from Sera to Potala, and foot-races from Potala to the city. On the 27th of the month the holy *Dorji* is carried in solemn procession from Sera to the Labrang, and to the presence of the Lama at Potala.

Of other great annual feasts, one, in the fourth month, is assigned to the conception of Sakya, but appears to connect itself with the old nature-feast of the entering of spring, and to be more or less identical with the *Halt* of India. A second, the consecration of the waters, in September-October, appears, on the confines of India, to be associated with the *Dussehra*.

On the 30th day of the second month there comes off a strange ceremony, akin to that of the scapegoat (which is not unknown in India). It is called the driving out of the demon. A man is hired to perform the part of demon (or victim rather), a part which sometimes ends fatally. He is fantastically dressed, his face mottled with white and black, and is then brought forth from the Labrang to en-

gave in quasi-theological controversy with one who represents the Grand Lama. This ends in their throwing dice against each other (as it were for the weal or woe of Lhasa). If the demon were to win the omen would be appalling, so this is effectually barred by false dice. The victim is then marched outside the city, followed by the troops, and by the whole populace, hooting, shouting, and firing volleys after him. Once he is driven off, the people return, and he is earned off to the Samayé convent. Should he die shortly after, this is auspicious; if not, he is kept in ward at Samayé for a twelvemonth.

Nain Singh, whose habitual accuracy is attested by many facts, mentions a strange practice of comparatively recent origin, according to which the civil power in the city is put up to auction for the first twenty-three days of the New Year. The purchaser, who must be a member of the Breathing monastery, and is termed the *Tajno*, is a kind of lord of misrule, who exercises arbitrary authority during that time for his own benefit, levying taxes and capricious fines upon the citizens.

Climate, &c.—Fundat Nain Singh, who lived at Lhasa continuously from 26th January to 21st April (1866), made indoor observations of the thermometer from 9th to 23d February hourly, with the exception of eight hours of sleep (11 p.m. to 7 a.m.), and the extreme variation in the record is from 26° (February 2d, 11 a.m.) to 46°·75 (February 22d, 2 p.m.). He also mentions that the river (Kichu Tsangpo) which flows by Lhasa was frozen in December,—the great river (Brahmaputra) being open and passed by boats. Water kept in the warmest part of a house froze, and burst the vessels holding it. It is not easy to draw very precise conclusions from these facts, but they perhaps indicate a somewhat less severe winter than that of Ladak, where the true air temperature is reckoned by Captain H. Strachey to range between zero and 30° Fahr. In other respects the Pundit's account of the climate does not differ materially from those we possess of western Tibet. He says, besides, that strong and high winds are very prevalent, especially during March and April, but snow fell only twice in the three months of his stay, and not deeper than 3 inches. The fall on the surrounding hills was somewhat heavier, but apparently it did not lie, for in general hardly any snow was to be seen from the city. Should the snowfall in Lhasa ever exceed a foot, it is regarded as an evil omen. What little Desideri says is to like effect. The cold, he says, was never hurtful to health, and he had often spent the night (in winter apparently) under the open sky, without suffering. Lightning, which occurs only in connexion with the summer rains, is never known to strike houses or to kill.

It begins to be warm in May, and the sun's power rapidly grows most oppressive. There is a distinct rainy season at Shigatse (July to September), and this appears to extend to Lhasa, though the information is not very precise. Nain Singh was told that earthquakes are unknown in the Lhasa province. Cholera is said to be unknown; but dysentery is often violent, and rapidly fatal. Cough and chest diseases are not prevalent, nor are skin diseases common, in spite of the filthy habits of the people. The most dreaded of all diseases is smallpox. Inoculation is habitually used. Ophthalmia is very prevalent and severe.

History.—The seat of the princes whose family raised Tibet to a position among the powers of Asia was originally on the Yarlung river, in the extreme east of the region now occupied by Tibetan tribes. It was transplanted to Lhasa in the 7th century by the king Srong-tsan-gampo, conqueror, civiliser, and proselytizer, the founder of Buddhism in Tibet, the introducer of the Indian alphabet. On the three-peaked crag now occupied by the palace-monastery of the Great Lama this king is said to have established his fortress, whilst he founded in the plain below temples to receive the sacred images, brought respectively from Nepal and from China, by the brides to whom his own conversion is attributed.

Tibet endured as a conquering power some two centuries, and the more famous among the descendants of the founder added to the city. This *rong-do-tsen* (who reigned 740-786) is said to have erected a great temple-palace of which the basement followed the Tibetan style, the middle story the Chinese, and the upper story the Indian—a combination which would equally symbolize the elements that here moulded the culture of Lhasa, such as it is. His son, the last of the great orthodox kings, in the next century, is said to have summoned artists from Nepal and India, and among many splendid foundations to have erected a sanctuary (at Samayé) of vast height, which had nine stories, the base lower of stone, the three middle of brick, the three uppermost of timber. With this king the glory of Tibet and of ancient Lhasa reached its zenith, and in 822 an obelisk recording his treaty on equal terms with the Great Tang emperor of China was erected in the city. There followed dark days for Lhasa and the Buddhist Church in the accession of this king's brother Langdharma, who has been called the Julian of the Lamas. This king rejected the doctrine, persecuted and scattered its ministers, and threw down its temples, convents, and images. It was more than a century before Buddhism recovered its hold, and its convents were rehabilitated over Tibet. The country was then split into an infinity of petty states, many of them ruled from the convents by like ecclesiastics, but, though the old monarchy never recovered, Lhasa seems to have maintained some supremacy, and probably never lost its claim to be the chief city of that congeries of principalities, with a common faith and a common language, which was called Tibet.

The Arab geographers of the 10th century speak of Tibet, but it is without real knowledge, and none speak of any city that we can identify with Lhasa. The first passage in any Western author in which such identification can be probably traced occurs in the narrative of Frai Odorico of Portofino (c. 1680). This remarkable traveller's route from Europe to India, and thence by sea to China, can be traced satisfactorily, but his journey homeward through Asia the indications are very fragmentary. He speaks, however, on his return journey of the realm of Tibet, which lay on the confines of India proper—"The folk of that country dwell in tents made of black felt. But the chief and royal city is all built with walls of black and white, and all its streets are very well paved. In this city no one shall dare to shed the blood of any, whether man or beast, for the reverence they bear a certain idol in this town is worshipped. In that city dwelleth the *Alansi*, &c., in their tongue the pope, who is the head of all the nobles, and who has the disposal of all their benches such as they are after their own will." (p. 100.)

We know that Kubla Khan had constituted a young prince of the Lama Church, *Mati Dhwaj*, as head of that body, and tributary ruler of Tibet, but besides this all is obscure for a century. This passage of Odorico shows that such authority continued under Kubla's descendants, and that some foreboding of the pestilence smote occupied by the Dalai Lama already existed. But it was not till a century after Odorico that the strange history of the dynasty of the Dalai Lamas of Lhasa actually began. And in the first two centuries of its existence the residence of those pontiffs was rather at Brebrog or Sen than at Lhasa itself, though the latter was the centre of devout resort. A great event for Lhasa was the conversion, or reconversion, of the Mongols to Lamaism (c. 1277), which made the city the focus of sanctity and pilgrimage to so vast a tract of Asia. It was in the middle of the 17th century that Lhasa became the residence of the Dalai Lama. A native prince, known as the Tsampo, with his seat at Shigatse, had made himself master of southern Tibet, and threatened to absorb the whole. The fifth Dalai Lama, *Nyang Lobsang*, called in the aid of a Geluk monk, *Gusha Khan*, from the neighbourhood of the Koko-nur, who defeated and slew the Tsampo and made over full dominion in Tibet to the Lama (1643). The latter now first established his court, and built his palace, on the rock-aisle of the fortress of the ancient monarchy, which apparently had fallen into ruin, and to this he gave the name of *Potala*.

In the time of this Dalai Lama, Lhasa was visited for the first time by European travellers. In 1624 Antonio d'Andrade, a Portuguese Jesuit, had penetrated to Tibet through the Ganges Himalaya, and returned the following year with a companion. But the place which he reached was *Chapungwa* in the kingdom of *Cogyne*, as he calls it, &c., Chapang in the province of Gugu on the Tibetan Setiof, and he never got nearer Lhasa. In June 1681 the Jesuit

¹ This name is absurdly explained by Abbé Huc as *Buddha-la*—"hill of Buddha." This is not even a possible etymology, for, whilst the actual term *Buddha* seems never to be used untranslated in Tibet, one may discern from Huc's own book that it means, not "a hill," but "a pass" over mountains. The name seems to be really taken from the classical traditions of the Buddhists, *Potala*, "the harbour" (the *Patala* of the Greeks, the modern Hyderabad on the Indus), was in legend the royal seat, for more than a hundred generations, of the Sakya progenitors of Gautama Buddha (see *Candac de Korbs in Journ. As. Soc. Bengal*, n. 599).

fathers, Albert D'Orville and John Grueber, stated from Peking, and by the way of Shingfu and the Koko-nur, reached Lhasa, where they stayed a month, and then went on through Nepal to India. The extracts from Grueber's narrative, given by Athanasius Kircher in his *China Illustrata* (Amst., 1667), are accompanied by a drawing of Potala which, though meagre, appears to be genuine, and is the only European representation in existence of that Tibetan fortress.

The founder of Potala died in 1682, and his death was followed by events which brought on a time of trouble. He had appointed as "regent" or civil administrator (*Tseri*, or *Debs*), one supposed to be his own natural son. This remarkable personage, Sangye Gyantsi, of great ambition and accomplishment, still remained in Tibet as the author of some of the most valued works of the native literature, concealed the death of his master, asserting that the latter had retired, in mystic meditation or trance, to the upper chambers of the palace. The government continued to be carried on in the name of the regent, who leagueed with Galdan Khan of Dzungaria against the Chinese (Manchu) power. It was not till the great emperor Kang-hi was marching on Tibet that the death of the Lama, sixteen years before, was admitted. A solemn funeral was then performed, at which 108,000 lamas assisted, and a new incarnation was set up in the person of a youth of fifteen. This young man was the second of the Lamasé Church in every line of civil living and debauchery. But it was under him and the regent Sangye Gyantsi that the Potala palace attained its present scale of grandeur, and that most of the other great buildings of Lhasa were extended and embellished. In 1705-6 a Calmuck prince, Lefsan Khan, great grandson of Bussai Khan, taking the renowned name of Jeppu Khan, made Lhasa master of Tibet, and put to death both the civil regent and the disolute Lama whom he had set up. The Dzungians crossed the northern desert in 1717, and stormed Lhasa, but were in vain driven out by the army of Kang-hi in 1720, and from that time the Chinese power, though, as elsewhere, it has been at times sorely shaken, has never quite lost its hold of Tibet.

It was in the midst of these troubled times (1708) that a Capuchin mission entered Lhasa. It was unfortunately in the death of its successive heads, and from about 1713 it was abandoned for several years, but after an interval the Capuchins reappeared, twelve in number, reaching Lhasa in 1720. On the 10th of April 1721, they heard of them all the head of the mission, P. Orazio della Porta, appeared at Rome in 1725 to report that nine were dead, and to ask reinforcement. He returned with nine more, carrying presents to the Grand Lama, and the so-called "king of Tibet." In 1742 he reported his safe arrival, and that the presents he had recently called to Nepal, made him master of the branch of the mission, he died there in 1747. We possess some of the results collected by this mission in an excellent short treatise on Tibet by P. Orazio himself, as well as in the extraordinary jodge-podge of crude philology, rubbish, and valuable facts (like fossils imbedded in a bank of mud), the *Alphabetum Tibetanicum* of the Augustinian monk At. Giorgi (Rome, 1723). The mission seems to have been expelled from Tibet in 1754, and found refuge for a time in Nepal. Some fifty volumes, the relics of the mission library, were in 1847 recovered from Lhasa by Mr. Bryan Hodgson, through the courtesy of the Grand Lama himself, and were transmitted as an offering to Pope Pius IX., then in the first bloom of reputation.

In 1716, moreover, two Jesuits, P. Ignazio Desideri di Pastore, and P. Freyre, a Portuguese, reached Lhasa by way of Kashmir, Ladakh, and the enormous journey from Ladakh by the holy lakes and the valley of the Tsangpo. Desideri remained at Lhasa till April 1721, witnessing the capture of Lhasa successfully by Dzungar and Chinese. Of the moderation of the latter, and their abstinence from all outrage or plunder, he speaks highly. His departure was due to controversies between the Jesuits and Capuchins at Rome, which caused an order to be issued for his retirement from Tibet. An interesting letter from him, dated 1719, 1716, is printed in the *Lettres Édiifiées*, Roc. xv, but a large MS. volume of his observations during his residence in Tibet is still unpublished. The next European visitor was Samuel Van de Putte of Friesland, an LL.D. of Leyden, whose thirst for travel carried him through India to Lhasa, where he is said to have remained a long time, to have acquired the language, and to have become intimate with some of the lamas. After travelling from Lhasa to Peking with a lama mission he returned, again by Lhasa, to India, and was an eye-witness of the sack of Delhi by Nadir Shah in 1737. Unhappily he ordered his papers to be burnt after his death, and the knowledge that such a traveller must have accumulated died with him. We pass on to 1811-12 when the first (and last) English visit to Lhasa occurred. The traveller was Thomas Manning, a Cambridge man of Caius College, who had been long devoted to Chinese studies, the "friend M." of Charles Lamb, from whom Eliza Follen professes to have got that translation of a Chinese MS. which furnished the immortal dissertation on roast pig. After residing some years at Canton, Manning went to Nankai, bent on reaching the interior of China through Tibet, since from the seaboard it was sealed. He actually did reach Lhasa, stayed there about five months, and had several interviews with the Dalai Lama, but was compelled to return to India. He never

published anything regarding his journey, and the very fact of its occurrence was known to few, when his narrative was printed, through the penmanship of Mr. C. Mackham, in 1876. The man had given the reins to his own eccentricities till he seemed to have lost all power of seriousness, and the account, though containing some passages of great interest, is most disappointing.

The next travellers to reach Lhasa were Eife and Gabet, French Lazarist priests, who travelled from China the route followed by Grueber and by Van de Putte, viz. Siningfu, and reached Lhasa 29th January 1846. On the 16th of March they were sent off under escort by the rugged road to Su-fu-dun. Huc's book, *Souvenirs du Tibet*, &c., is probably still well known, and deserves to be so, for it is one of the most delightful among books of travel. Huc was indeed, not only without a sense, perhaps without accurate knowledge of any kind, but also without that geographical sense which sometimes enables a traveller to bring back valuable contributions to geographical knowledge though unable to make instrumental observations. He was, however, amazingly clever as a narrator and sketched of character, and, in this his first work, his ambition to slake had not gained the upper hand as it did fatally in later works. It was Ke-shen, a well-known Chinese statesman, disgraced for making peace with the English at Canton in 1841, and who was then on a nominal detention to Lhasa, who ostensibly came to them. The Tibetan regent, with his enlightened and kindly spirit, is painted by Huc in most attractive colours, and Mr. Markham expresses strongly the opinion that the native authorities were most willing to receive strangers, whilst the jealousy that excluded them was Chinese only. Recent experience of attempts to enter Tibet contradicts this view. The lamas, whose rule seems to have become more and more grasping and oppressive, appear to be sensible that their system would cease to find peace, and are violently opposed to the passage of Europeans across the Tibetan frontier.

Our latest narrative of a visit to Lhasa is that of the late Pandit Nair Singh, trained as an explorer in the Indian survey department. He reached the city in the course of two most remarkable journeys. In the first, after an ineffectual attempt by Nepal, he travelled by the Manasarovar Lake, and the road thence eastward, parallel to the course of the Tsangpo, reaching Lhasa 10th January 1866, and leaving it 21st April 1867. On the 10th of April 1867, he started from Ladakh, crossing the vast and elevated plateau by the Tengri-nur and other great lakes, and again reaching Lhasa 18th November. Between these two journeys Lhasa had also been visited by another native explorer in 1873. Nair Singh, by his extraordinary surveys, and by repeated observations of latitude on his first visit, has, for us, the position of Lhasa. But he also has given an account of his journey, and of his residence there, which, though brief, is full of intelligence and interest, and appears to be thoroughly trustworthy. This enterprising and deserving man was, on the completion of his journey in 1875, rewarded by the Indian Government with a pension and grant of land, and afterwards received the gold medal of the Roy. Geog. Soc. and the Companionship of the Star of India. He died early in 1882.

Baker, printed in *Asiatic Researches of India*, November 8, 1879; "The Silver Coinage of Tibet," by J. H. van der Couperie, in *Nieuw. Chron.*, 8d ser., vol. i. (H. Y.)

L'HÔPITAL, or L'HOSPITAL, MICHEL DE (c.1505-1573), chancellor of France from 1560 to 1568, was born near Aignepierre in Auvergne (now Puy-de-Dôme) about the year 1505. His father, who was physician and controller of accounts to the constable Charles de Bourbon, sent him to study at Toulouse, whence at the age of eighteen he was driven by the evil fortunes of the family patron, after suffering arrest and imprisonment, to Padua, in which university he studied law and letters for about six years. On the completion of his studies he joined his father at Bologna, and afterwards, the constable having died, went to Rome in the suite of Charles V. For some time he held the position of auditor of the rota at Rome, but in 1534, encouraged by the fair promises of Cardinal de

² See Walker's Report for 1873-74.

Grammont, he returned to France. The death of his patron soon afterwards seriously impaired his prospects; but after he had entered himself of the Parisian bar, his marriage, in 1537, to a daughter of the lieutenant-criminal procured for him the post of counsellor to the parliament of Paris. This office he held until 1547, when he was sent by Henry II. on a mission to Bologna, where the council of Trent was at that time sitting; after sixteen months of wearisome inactivity there, he was by his own desire recalled at the close of 1548. L'Hôpital now for some time held the position of "chancellor" in the household of the princess Margaret, duchess of Berry, and in 1554 he was made superintendent of the royal finances. In 1559 he accompanied his mistress, now duchess of Savoy, to Nice, where, on the following year, tidings reached him that he had been chosen to succeed Olivier in the chancellorship of France. One of his first acts after entering on the duties of his office (in July 1560) was to cause the parliament of Paris to register the edict of Romorantin, of which he is sometimes, but erroneously it would seem, said to have been the author. Designed as it was to protect so-called heretics from the secret and summary methods of the Inquisition, it certainly had his sympathy and approval. In accordance with the consistent policy of inclusion and toleration by which the whole of his official life was characterized, he induced the council to call the Assembly of Notables, which met at Fontainebleau in August 1560 and agreed that the States General should be summoned, all proceedings against heretics being meanwhile suppressed, pending the reformation of the church by a general or national council. The States General met in December; the edict of Orleans (July 1561) followed, and finally, after the colloquy of Poissy, that of January 1563, the most liberal (except that of Nantes) ever obtained by the Protestants of France. Its terms, however, were not carried out, and during the war which was the inevitable result of the massacre of Vassy in May, L'Hôpital, whose dismissal had been for some time urged by the papal legate Hippolytus of Este, found it necessary to retire to his estate at Vignay near Etampes, whence he did not return until after the pacification of Amboise (March 19, 1563). It was by his advice that Charles IX. was declared of age (August 17, 1563) at Rouen, a measure which really increased the power of Catherine de' Medici; and it was under his influence also that the parliament of Paris in 1564 refused to sanction the publication of the acts of the council of Trent, on account of their inconsistency with the Gallican liberties. In 1564-66 he accompanied the young king on an extended tour through France; and in 1566 he was instrumental in the promulgation of an important edict for reform of abuses in the administration of justice. The renewal of the religious war in September 1567, however, was at once a symptom and a cause of diminished influence to L'Hôpital, and in February 1568 he obtained his letters of discharge, which were registered by the parliament on May 11, his titles, honours, and emoluments being reserved to him during the remainder of his life. Henceforward he lived a life of unbroken literary seclusion at Vignay, his only subsequent public appearance being by means of a "mémoire" which he addressed to the king in 1570 under the title *Le but de la guerre et de la paix, ou Discours du chancelier L'Hôpital pour exhorter Charles IX. à donner la paix à ses subjects*. Though not exempt from considerable danger, he passed in safety through the troubles of the St Bartholomew, but did not long survive them. His death took place either at Vignay or at Bélesbat (Courdimanche, Etampes) on March 13, 1573.

After his death, Pithus, assisted by De Thou and Scévole de Sainte-Marthe, collected a volume of the *Œuvres* of L'Hôpital, and in 1586 his grandson published *Epistolæ seu Sermones*

libræ æsæ. The complete *Œuvres* of L'Hôpital were published for the first time by Dufoy (6 vols 8vo, Paris, 1824-25). They include his "Harangues" and "Remonstrances," the *Épîtres*, the *Mémoires* to Charles IX., a *Traité de la Réformation de la Justice*, and the will of L'Hôpital. Haag (*France Prot.*, vii. p. 83) gives the titles of several MSS. still unpublished. Villamain wrote a *Vie de L'Hôpital*, which has recently been reprinted (1874), and there are monographs also by Tallander (1861) and by Dupré-Lasol (1875).

LIAU-YANG, or LIAOU-YANG, a city of China, formerly the chief town of the province of Liau-tung or Shing-king (southern Manchuria), and still a place of considerable mark, 35 miles south of Moukden. It is situated in a rich cotton district, and carries on no small trade. The walls include an area about $2\frac{1}{2}$ miles long by 2 miles broad, and there are pretty extensive suburbs; but a good deal even of the enclosed area is under cultivation. The population is estimated at 80,000.

LIBANIUS, a Sophist, was the most distinguished Greek writer of the 4th century A.D. He was born at Antioch between 314 and 316. He studied at Athens, and spent most of his earlier manhood in Constantinople and Nicomedia. His private classes at Constantinople were much more popular than those of the public professors; and their jealousy found means of having him expelled from Constantinople in 346 on the charge of studying magic. He was recalled from Nicomedia after five years. Ill health obliged him to retire to Antioch, where he spent the later part of his life. Though a pagan by religion, he enjoyed the favour of the Christian emperors. When Julian restored paganism as the state religion, Libanius showed no intolerance. Among his pupils he numbered St John Chrysostom and St Basil. His works, consisting chiefly of orations, declamations on set topics, and letters, are very voluminous, and have not yet been published in one single edition. He devoted much time to the study of the classical Greek writers, on whom his style is modelled with considerable success.

The best edition of the orations and declamations is Reuske's, of the letters Wolf's. See Westermann, *Gesch. d. Griech. Bedenktheit*; Bernhardt's and other histories of Greek literature; Förster, *Zur Schriftstellerei des Libanius*, and articles in *Hermes*, vols. ix. and x.

LIBAU (*Leepaja* of the Letts), a port of Russia, on the Baltic Sea, in the government of Courland and district of Grobin, 143 miles by rail south-west of Riga. It is situated at the northern extremity of a narrow sandy peninsula which separates Lake Libau (12 miles long and 2 miles wide) from the Baltic Sea. The town is well built of stone, with good gardens, and has a gymnasium and more than twenty different schools, cigar manufactories, machine works, and a small wharf. The sea throwing up a good deal of amber, many inhabitants are engaged in the fabrication of small articles of that substance. The harbour of Libau was 2 miles south of the town until a canal was dug through the peninsula in 1897, but this canal is liable to be silted up, and the depth at the bar is only 9 feet, or even 6 feet during south-west winds, so that larger ships must lie in the open roadstead. Libau being the most southern Baltic port in Russia has the advantage of freezing only for a few weeks during the winter. Since being brought, in 1872, into railway connexion with Moscow, Orel, and Kharkoff, it has become an important Russian port, and competes with the northern ports of Prussia, the exports already exceeding by 100,000 tons those from Königsberg. In 1879 the port of Libau was visited by 1976 ships, and the export of corn, flax, hempseed, and linseed has reached 28,212,600 roubles (about £2,822,000), against 1,980,000 roubles and 367 ships in 1872. The merchants carry on an active trade in grain and flax, making their purchases directly in southern Russia; their warehouses are numerous, spacious, and well built. The

yearly fair has some importance for the neighbouring districts. The town is also a watering-place, yearly visited by several hundreds of persons. Population in 1881, 27,500, with military and railway servants, 30,000.

The port of Lahn, *Lepa portus*, is mentioned as early as 1263, it then belonged to the Lovenian order. In 1418 it was burnt by Lithuanians, and in 1560 it was mortgaged by the grandmaster of the order to the Prussian duke Albert. It was annexed to Russia in 1795.

LIBEL AND SLANDER are the terms employed in English law to denote injurious attacks upon a man's reputation or character by words written or spoken, or by equivalent signs. In most early systems of law we find verbal injuries treated as a criminal or quasi-criminal offence, the essence of the injury lying not in pecuniary loss, which may be compensated by damages, but in the personal insult which must be atoned for,—a vindictive penalty coming in the place of personal revenge. By the law of the XII. Tables, the composition of scurrilous songs and gross noisy public affronts were punished by death. Minor offences of the same class seem to have found their place under the general conception of *iniuria*, which included ultimately every form of direct personal aggression which involved contumely or insult. In the later Roman jurisprudence, which has, on this point, exercised considerable influence over modern systems of law, we find verbal injuries dealt with in the edict under two heads. The first comprehended defamatory and injurious statements which were made in a public manner (*convictum contra bonos mores*). In this case the essence of the offence lay in the unwarrantable public proclamation, in the contumely which was offered to a man before his fellow-citizens. In such a case the truth of the statements was justification for the unnecessarily public and insulting manner in which they had been made. The second head included defamatory statements which were made in private, and in this case the offence lay in the imputation itself, not in the manner of its publication. The truth was therefore a sufficient defence, for no man had a right to demand legal protection for a false reputation. Even belief in the truth was enough, because it took away the intention which was essential to the notion of *iniuria*. The law thus aimed at giving sufficient scope for the discussion of a man's character, while at the same time it protected him from needless insult and pain. The remedy for verbal injuries was long confined to a civil action for a money penalty, which was estimated according to the gravity of the case, and which, although vindictive in its character, doubtless included practically the element of compensation. But a new remedy was introduced which the extension of the criminal law under which many kinds of defamation were punished with great severity. We find at the same time increased importance attached to the publication of defamatory books and writings, the *libri* or *libelli famosi*, from which we derive our modern use of the word libel; and under the later emperors the latter term came to be specially applied to anonymous accusations or paeuils, the dissemination of which was regarded as peculiarly dangerous, and visited with very severe punishment, whether the matter contained in them were true or false.

The earlier history of the English law of defamation is somewhat obscure. Civil actions for damages seem to have been tolerably frequent so far back as the reign of Edward I. There was no distinction drawn between words written and spoken. When no pecuniary penalty was involved such cases fell within the old jurisdiction of the ecclesiastical courts, which was only finally abolished during the present reign. It seems, to say the least, uncertain whether any generally applicable criminal process was in use. The crime of *scandalum magnatum*, spreading false reports about the magnates of the realm, was established by statutes,

but the first fully reported case in which libel is affirmed generally to be punishable at common law is one tried in the Star Chamber in the reign of James I. In that case no English authorities are cited except a previous case of the same nature before the same tribunal; the law and terminology appear to be taken directly from Roman sources, with the insertion that libels tended to a breach of the peace; and it seems probable that that not very scrupulous tribunal had simply found it convenient to adopt the very stringent Roman provisions regarding the *libelli famosi* without paying any regard to the Roman limitations. From that time we find both the criminal and civil remedies in full operation, and will now consider how the law stands with regard to each at the present time.

Civil Law—The first important distinction we encounter is that between slander and libel, between the oral and written promulgation of defamatory statements. In the former case the remedy is limited. The law will not take notice of every kind of abusive or defamatory language. It must be shown either that the plaintiff has suffered actual damage as a direct consequence of the slander, or that the imputation is of such a nature that we are entitled to infer damage as a necessary consequence. The special damage on which an action is founded for slanderous words must be of the nature of pecuniary loss. Loss of reputation or of position in society, or even illness, however clearly it may be traced to the slander, is insufficient. When we cannot prove special damage, the action for slander is only allowed upon certain strictly defined grounds. These are the imputation of a crime or misdemeanour which is punishable corporally, e.g., by imprisonment, the imputation of a contagious or infectious disease, statements which tend to the dishonour of an appellant heir (other cases of slander of title when the party is in possession requiring the allegation of special damage); and lastly, slanders directed against a man's professional or business character, which tend directly to prejudice him in his trade, profession, or means of livelihood. In the latter case the words must either be directly aimed at a man in his business or official character, or they must be such as necessarily to imply unfitness for his particular office or occupation. Thus words which merely reflect generally upon the moral character of a tradesman or professional man are not actionable, but they are actionable if directed against his dealings in the course of his trade or profession. But, in the case of a merchant or trader, an allegation which affects his credit generally is enough, and in the same way it has been held that statements are actionable which affect the ability or moral character of persons who hold office, or exercise occupation which requires a high degree of ability, or infer peculiar confidence. In every case the plaintiff must have been at the time of the slander in the actual exercise of the occupation or enjoyment of the office with reference to which the slander is supposed to have affected him.

The action for libel is not restricted in the same way as that for slander. Originally, as we have seen, there appears to have been no essential distinction between them, but the establishment of libel as a criminal offence had probably considerable influence, and it soon became settled that written defamatory statements, or pictures and other signs which bore a defamatory meaning, implied greater malice and deliberation, and were generally fraught with greater injury than those which were merely made by word of mouth. The result has been that the action for libel is not limited to special grounds, or by the necessity of proving special damage. It may be founded on any statement which disparages a man's private or professional character, or which tends to hold him up to hatred, contempt, or ridicule. In one of the leading cases, for example, the

plaintiff obtained damages because it was said of him that he was a hypocrite, and had used the cloak of religion for unworthy purposes. In another case a charge of ingratitude was held sufficient. In civil cases the libel must be published by being brought by the defendant under the notice of a third party, and it has even been held that it is sufficient if this has been done by gross carelessness, without deliberate intention to publish. Every person is liable to an action who is concerned in the publication of a libel, whether he be the author, printer, or publisher, and the extent and manner of the publication, although not affecting the ground of the action, is a material element in estimating the damages.

It is not necessary that the defamatory character of the words or writing complained of should be apparent on their face. They may be couched in the form of an insinuation, or may derive their sting from a reference to circumstances understood by the persons to whom they are addressed. In such a case the plaintiff must make the injurious sense clear by an averment called an *innuendo*, and it is for the jury to say whether the words bore the meaning thus ascribed to them.

In all civil actions for slander and libel the falsity of the injurious statements is an essential element, so that the defendant is always entitled to justify his statements by their truth; but when the statements are in themselves defamatory, their falsity is presumed, and the burden of proving their truth is laid upon the defendant. There are however, a large class of false defamatory statements, commonly called privileged, which are not actionable on account of the particular circumstances in which they are made. The general theory of law with regard to these cases is this. It is assumed that in every case of defamation intention is a necessary element, but in the ordinary case, when a statement is false and defamatory, the law presumes that it has been made or published with an evil intent, and will not allow this presumption to be rebutted by evidence or submitted as matter of fact to a jury. But there are certain circumstances in which the natural presumption is quite the other way. There are certain natural and proper occasions on which statements may be made which are in themselves defamatory, and which may be false, but which naturally suggest that the statements may have been made from a perfectly proper motive and with entire belief in their truth. In the cases of this kind which are recognized by law, the presumption is reversed. It lies with the plaintiff to show that the defendant was actuated by what is called *express malice*, by an intention to do harm, and in this case the question is not one of legal inference for the court, but a matter of fact to be decided by the jury. Although, however, the theory of the law seems to rest entirely upon natural presumption of intention, it is pretty clear that in determining the limits of privilege the courts have been almost wholly guided by considerations of public or general expediency.

In some cases the privilege is absolute, so that we cannot have an action for defamation even although we prove express malice. Thus no action of this kind can be maintained for statements made in the course of judicial proceedings if they are in any sense relevant to the matter in hand. In the same way no statements or publications are actionable which are made in the ordinary course of parliamentary proceedings. Papers published under the authority of parliament are protected by a special Act, 3 & 4 Vict. c. 9, which was passed after a decree of the law courts adverse to the privilege claimed. The reports of judicial and parliamentary proceedings stand in a somewhat different position, which has only been attained after a long and interesting conflict. The general rule now is that all reports of parliamentary or judicial proceedings

are privileged in so far as they are honest and impartial. Even *ex parte* proceedings, in so far as they take place in public, now fall within the same rule. But if the report is garbled, or if part of it only is published, the party who is injured in consequence is entitled to maintain an action, and to have the question of malice submitted to a jury. Comments on subjects of public interest, on the proceedings of courts or public bodies, on publications, exhibitions, and on persons who have in any way chosen to invite the public attention, fall within a similar rule. The public interest demands that on all these subjects a fair latitude for discussion should be permitted; the citizen is entitled to the utmost liberty so long as he expresses nothing more than his honest opinion of the subject before him, but if it can be proved that he has used false and defamatory language out of malice, and especially if he has travelled beyond the facts which are properly before the public, he is no longer protected by his privilege. In private life a large number of statements are privileged so long as they remain matters of strictly private communication. It is difficult to define the limits of private privilege without extensive reference to concrete cases, but generally it may be said that it includes all communications which are made in performance of a duty not merely legal but moral or social, answers to *bona fide* inquiries, communications made by persons in confidential relations regarding matters in which one or both are interested, and even statements made within proper limits by persons in the *bona fide* prosecution of their own interest. Common examples of this kind of privilege are to be found in answer to inquiries as to the character of servants or the solvency of a trader, warnings to a friend, communications between persons who are jointly interested in some matters of business. But in every case we must be careful not to exceed the limits of publication required by the occasion, or otherwise the privilege is lost. Thus defamatory statements may be privileged when made to a meeting of shareholders, but not when published to others who have no immediate concern in the business.

In a few instances in which an action cannot be maintained even by the averment of malice, the plaintiff may maintain an action by averring not only malice but also want of reasonable and probable cause. The most common instances of this kind are malicious charges made in the ordinary course of justice and malicious prosecutions. In such cases it would be contrary to public policy to punish or prevent every charge which was made from a purely malicious motive, but there is no reason for protecting accusations which are not only malicious, but destitute of all reasonable probability.

Criminal Law.—Publications which are blasphemous, immoral, or seditious are frequently termed libels, and are punishable both at common law and by various statutes. The matter, however, which constitutes the offence in these publications lies beyond our present scope. Libels upon individuals may be prosecuted by criminal information or indictment, but there can be no criminal prosecution for slander. So far as concerns the definition of libel, and its limitation by the necessity of proving in certain cases express malice, there is no substantial difference between the rules which apply to criminal prosecutions and to civil actions, with the one important exception (now considerably modified) that the falsity of a libel is not in criminal law an essential element of the offence. If the matter alleged were in itself defamatory, the court would not permit inquiry into its truth. The sweeping application of this rule seems chiefly due to the indiscriminate use, in earlier cases, of a rule in Roman law which was only applicable to certain modes of publication, but has been supported by various reasons of general policy, and especially by the

view that one main reason for punishing a libel was its tendency to provoke a breach of the peace. The same view has occasioned a difference in the publication required in civil and criminal actions. It is enough in criminal law that the libel has been published to the party against whom it is directed, if it is averred that it is intended or calculated to produce a breach of the peace. Important alterations, however, have been introduced into this branch of the law by 6 & 7 Vict. c. 95. By that Act any person who maliciously publishes a defamatory libel may be punished by fine or imprisonment or both, the imprisonment not to exceed one year. Any person maliciously publishing a defamatory libel, knowing the same to be false, is liable to fine and imprisonment for two years. In every case the truth of the matters charged may be inquired into if it be pleaded, but the truth does not amount to a defence unless it is also proved that the publication was for the public benefit; and if, after such plea, the defendant is convicted, it is competent to the court to consider whether the guilt of the defendant is mitigated or aggravated by the plea, and the evidence given in relation to it. By the same Act a defendant is protected from publication of libels without his knowledge, authority, or consent, if the publication did not arise from the want of due care and caution on his part. The court are further authorized to award costs to the defendant in any information or indictment at the instance of a private prosecutor.

An important dispute about the powers of the jury in cases of libel arose during last century in connexion with some well known trials for seditious libels. The point is familiar to readers of Macaulay in connexion with the trial of the seven bishops, but the cases in which it was brought most prominently forward, and which led to its final settlement, were those against Woodfall (the printer of *Junius*), Wilkes, and others, and especially the case against Shipley, the dean of St Asaph (21 St. Tr. 925), in which the question was fought by Mr Erskine with extraordinary energy and ability. The controversy turned upon the question whether the jury were to be strictly confined to matters of fact which required to be proved by evidence, or whether in every case they were entitled to form their own opinion upon the libellous character of the publication and the intention of the author. There could be no doubt of course that the jury, if they pleased, had it in their power to return a general verdict of guilty or not guilty, but both in theory and practice they were subject in law to the directions of the court, and had to be informed by it as to what they were to take into consideration in determining upon their verdict (see *JURY*). There is no difficulty about the general application of this principle in criminal trials. In a case of murder, for example, the judge directs the jury that if they are satisfied the accused did so and so they ought to find him guilty. He directs them, not merely as to the definition of the crime, but as to the particular facts which fall within that definition. If the crime is one which is inferred by law from certain facts, they are only concerned with these facts, and must accept the construction which is put upon them by law. Applying these principles to the case of libel, juries were directed that it was for the court to determine whether the publication fell within the definition of libel, and whether the case was one in which malice was to be inferred by construction of law. If the case were one in which malice was inferred by law, the only facts left to the jury were the fact of publication and the meaning ascribed by innuendoes; they could not go into the question of intention, unless the case were one of privilege, in which express malice had to be proved. In general principle, therefore, the decisions of the court were in accordance with the ordinary principles of criminal law. But there were

undoubtedly some peculiarities in the case of libel. The sense of words, the inferences to be drawn from them, and the effect which they produce are not so easily defined as gross matters of fact. They seem to belong to those cases in which the impression made upon a jury is more to be trusted than the decision of a judge. And further, owing to the mode of procedure, the defendant was often punished before the question of law was determined. But nevertheless the question would scarcely have been raised had the libels related merely to private matters. The real ground of dispute was the liberty to be accorded to political discussion. Had the judges taken as wide a view of privilege in discussing matters of public interest as they do now, the question could scarcely have arisen; for Erskine's whole contention really amounted to this, that the jury were entitled to take into consideration the good or bad intent of the authors, which is precisely the question which would now be put before them in any matter which concerned the public. But at that time the notion of a special privilege attaching to political discussion had scarcely arisen, or was at least confined within very narrow limits, and the cause of free political discussion seemed to be more safely entrusted to juries than to courts. The question was finally settled by Mr Fox's Libel Act (32 Geo. III. c. 50), by which the jury were entitled to give a general verdict on the whole matter put in issue.

Scotch Law.—In Scotch law there were originally three remedies for defamation. It might be prosecuted by or with the concurrence of the lord advocate before the Court of Justiciary; or, secondly, a criminal remedy might be obtained in the commissary (ecclesiastical) courts, which originally dealt with the defender by public retraction or penance, but subsequently made use of fines payable to their own prosecutor or to the party injured, these latter being regarded as solatium to his feelings; or, lastly, an action of damages was competent before the Court of Session, which was strictly civil in its character, and aimed at the reparation of pecuniary loss. The first remedy has fallen into disuse, the second and third (the commissary courts being now abolished) became mixed up together, and are represented by the present action for damages or solatium. Originally the action before the Court of Session was strictly for damages founded, not upon the *animus injuriandi*, but upon culpa, and could be defended by proving the truth of the statement. But in time the Court of Session began to assume the original jurisdiction of the commissary courts, and entertained actions for solatium in which the *animus injuriandi* was a necessary element, and to which, as in Roman law, the truth was not necessarily a defence. Ultimately the two actions got very much confused. We find continual disputes as to the necessity for the *animus injuriandi* and the applicability of the plea of *veritas convicta*, which arose from the fact that the courts were not always conscious that they were dealing with two actions, to one of which these notions were applicable, and to the other not. On the introduction of the jury court, presided over by an English lawyer, it was quite natural that he, finding no very clear distinction maintained between damage and solatium, applied the English plea of truth as a justification to every case, and retained the *animus injuriandi* both in ordinary cases and cases of privilege in the same shape as the English conception of malice. The leading and almost only difference between the English and Scotch law now are that the latter makes no essential distinction between oral and written defamation, that it practically gives an action for every case of defamation oral or written upon which in England a civil action might be maintained for libel, and that it possesses no criminal remedy. In consequence of the latter defect and the indiscriminate application of the plea of *veritas* to every case both of damages and solatium, there appears to be at present no remedy in Scotland even for the wildest and most needless publication of offensive statements if only they are true.
